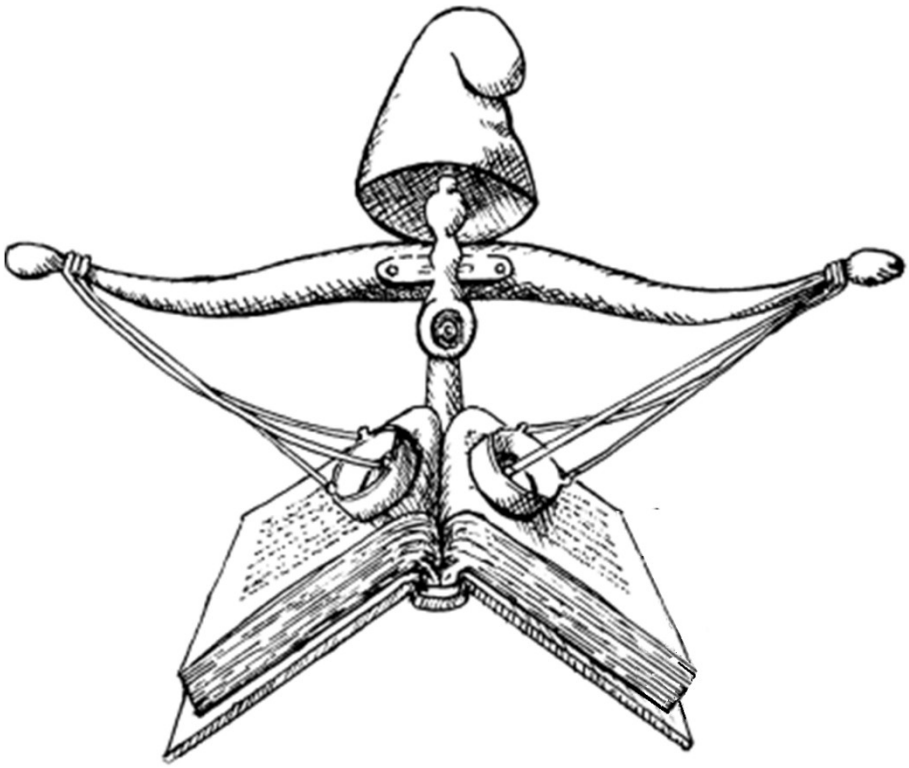
The Book of Mutualism

An Encyclopedic, Natural Moral History
with Philosophical Interjections
and Appendices



William Schnack

Along with new content, this book contains my previous book, *Heretics, Radicals, & MUTUALISM*, as well as portions from both volumes of *The Evolution of Consent: Collected Essays*, all of which are now out of print. This book serves as an update to these others.

PREFACE

Is This Book for You?

This book has both a general and a specific focus.

The general focus provides a cross-disciplinary natural history that will be of interest to a wide range of readers, with a rich, comprehensive model of Nature. But be warned: This work is not just a simple repeat of mainstream college discourse. It's pure heresy. It's absolutely radical. This is a book for revolutionaries. It takes a fresh new look at the pre-history and history of the Universe, going from the beginning up to today, giving an alternative outlook on cosmology, geology, evolutionary biology, and the human races, providing for a rich and cohesive new outlook, a "philosophy of everything" that will make your professors squirm and your pastor, boss, landlord, banker, and politicians with them. If you have an interest in cosmology, evolutionary biology, or anthropology, the first section or two of the book will be of special interest to you. There, I explore such concepts as an oscillating Universe, an expanding Earth, and convergent evolution, the context within which the mutualism of the human races is explored.

The specific focus is on the moral importance of both loving Nature and engaging with one another mutually, and particularly on those who have historically embraced such things. This part focuses a little more on details of social evolution and history, and in particular the development of economic, religious, and political authority and most especially those who came to oppose it. In this respect, it is as much a work of moral philosophy as it is a natural history. It provides light-handed philosophical guidance and moral insight through the lens of history.

Many themes or elements of interest to the reader have made their way into the text, including:

Natural Philosophy and Science
Cyclical Cosmology and Growing Earth
Syntropy and Convergent Evolution
Extinct Humans and Cryptids
Prehistory and Extrabiblical History
Race, Ethnicity, and Culture
Anglo-Saxons, Jats, and Jews
Rational Mysticism and Green Magic
Freemasonry, Illuminati, and Secret Societies
Primitive Christianity and Religious Dissenters
Pantheism and Free thought
Islamic Golden Age and the Coexistence
Renaissance, Reformation, and Enlightenment
Rational Egoism and Enlightened Self-Interest
Classical Republicanism, Federalism, and Anarchism
Unions, Cooperatives, and Mutuals
Modernism and Postmodernism
Communism, Fascism, and Synarchism
and much more…

It is fair to say that this book will catch the attention of anyone interested in history, religion, science, or philosophy, those with an interest in heretical and radical views, as well as those who are into conspiracy theory and "fringe" ideas or "outside of the box" thinking in general.

This book has been written for scholarly, educational, moral, ethical, and social evolutionary purposes, to provide substance for contemplation, study, and further research, and to inspire introspection, good deeds, and conscientious progress. It has been my civil duty and my moral and ethical obligation, as a still-free man in a decadent society, to engage in this study of mutualism and the context within which it exists, as well as to share my understanding with you so that you too may heed the word of reciprocity and appreciate Nature's blessings. It has been my honor to fill the gap left by the myriad of those "better suited" to write this work, the so-called "experts."

This book is not written with a high regard for academics, CEOs, presidents, priests, or anyone with a accredited degree, license, or title of authority. At least, not for those who are not willing to do some learning and introspection. All authority such as that, all dominance and exploitation, is on a dead-end path, teleologically-speaking. As such, it is morally and spiritually wrong, and so wrong by Nature. This is owed to its essence, which is performative, theatric, and virtual, propped up by ignorance and stupidity, and which is not at all real except as a convention.

This book is written, instead, for the common people, those who knew in their gut that college was not for them, that the economy as it exists is robbery, that government is organized violence, and that religion too often takes one further from God, or Nature. It was written by a common person who, miraculously, still has a soul left.

The idea of "speaking truth to power," as if power has a soul for caring, is generally laughable. I do not speak truth to power; I speak truth to the people so that they may take power for themselves and so effectively abolish power.

My duty as a philosopher is to render discerning judgement upon facts and testimonies, and to relay my deductions, abductions, and analogies for your secondary consideration, for you to rule on. Even a philosopher is not a substitute for your own discerning judgement, that is, but merely drafts a resolution for your approval or disapproval. You must ultimately be your own philosopher. I ask, this being the case, that you not treat my words as those of authority, but those of a peer. Look into my claims and compare them with what you know to be true of the world. See if there is anything complementary to what you already know to be so. Throw out the bad and keep the good.

If you decide for yourself what to believe, you just may be, like me, a *heretic*. If you look to the root for your beliefs, you are most assuredly a *radical*. And if upon looking to the root you discover mutuality, you must be a *Mutualist*. This book is for you.

EXTENDED PREFACE

Method and Motive

My method, while not detailed, has been that of free thought. It has been to become learned in consensus views, both real and imagined by the institutions, but then to challenge these otherwise consensus views from any known angle, to see if they stand up to scrutiny. Where they do not stand up to scrutiny, I replace the otherwise consensus views with new working hypotheses that I believe to be more coherent. Free thought suggests that popular acceptance is not a good qualifier for truth, but that, to the contrary, the truth of a matter is often unpopular or even publicly demonized, while folly is often praised.

Epistemologically, or in terms of know-how, I am not completely dismissive of testimony, but, instead, and quite the contrary, consider all communicated information to be testimony, including that of beloved authors and inspirants of other sorts. Testimony that correlates with natural facts— especially those popularly observable, and particularly those observed by myself, secondarily those of my economic class— is given priority over that which does not correlate with evidence. However, where the natural facts do not significantly contradict testimony, and particularly where testimony has explanatory power that is not yet discovered in nature, and when it coheres with it, historical and even religious, mythical, or legendary testimony is given priority over the lack of belief, though never as a rigid dogma unable to be challenged by natural fact.

I have taken up an interest in the physical sciences chiefly for the purpose of engaging social philosophy within the context of physical reality and natural history. My interest in special areas of physical science is generally limited to those moral and practical takeaways that I find to represent important influences on the social sciences. I am not a specialist, but, as a social philosopher, I have become keenly aware of the corruption of the sciences by human efforts.[1] And, while I am not a physical scientist, as a social philosopher, I have found it my responsibility to pursue the true physical sciences as a *generalist*, one who looks at all of the factors without limit, so that I can honestly engage in my field in social philosophy with more confident specialism.

I generally accept claims until they fail under scrutiny. Being a generalist means knowing which of the claims by specialists to take into consideration. It does not necessitate full comprehension of all of the details under consideration by the specialists, but it does entail considering the outcomes of the specialists' efforts. The General does not know all that occurs under his command, nor all of the circumstances being faced by his personnel. Rather, the General knows about general matters, the big picture. He references specialists, but is not accountable to them or under their authority. He is free to disagree, to pick and choose between the specialists, having heard their varying opinions, including areas of incongruity. These areas of incongruity is where the General must act, often in absence of certitude, by way of pure logical abduction, sometimes even by gut feeling. When it comes down to it, science can tell us a lot about what has already happened, and can even predict a great deal about mechanical results of the future, but it cannot replace the human management of the uncertain nor human capacity for discerning judgement. Living life means making decisions without certainty. A General is simply one who is well-aware of this fact.

---

[1] This is not to say that science itself is corrupt. Science is a method. Rather, the practitioners of the method are not adhering properly to that method. Social, economic, and political influences have all come to influence the direction that science would take. Most importantly, complex and long-term studies require institutional support, including funding and recognition of the findings. Without this institutional support, good science can be pushed under the rug and ignored, or kept to a select group of knowers. This is unfortunately all-too-often the case.

As a generalist, I have taken an interest in the claims of specialists from the various fields of knowledge. Having taken to a cross-disciplinary approach, I am especially interested in coherence between fields. Where there is incoherence between fields of specialty, such as between physics and biology, or economics and sociology, or even within a given field, I see a philosophical problem. I treat these problems in one of two ways: I reject one position in favor of another where there is a clear failure on the part of one of the positions, or, where both positions are cogent or sound, I accept both notions dialectically or antinomally, though at times, where a clear resolution is not possible, preferring to remain agnostic. I am especially agnostic on dating claims, as I believe it to be fallacious to try to place an exact time. Rather, I am interested in chronology of events, and have so presented the information here. I am also more agnostic toward claims regarding the microscopic, the very distant (time or location), the future, and other areas outside of the range of common sense observation. If anything I come across goes against more foundational beliefs, I reassess those beliefs. If those beliefs cannot be replaced with something better, I do not use the contradictory information, at least as it comes, in my working hypothesis.

While there are some statements dependent upon fanciful and technocratic matters, such as DNA, I privilege objective, common sense observations over those dependent upon instruments unavailable to non-specialists. My reason for doing this is that I do not intend to forfeit mine or others' best judgements to interpretations of phenomena observed in instruments under the control of the ruling class. Again, my reasons for my lack of confidence in the human practice of science come from my comprehensions of the history of the philosophy of science and the sociology of science. While science itself and scientific outcomes are not a problem, there is an issue of user-error, dishonesty, corruption, and even conspiracy influencing the perceived results of the science. This being so, I privilege observations that can be made by the common person, directly, without an intermediary in a lab coat. You might think of this, though not religiously, as analogous to a Protestant approach to science and a rejection of scientific priestcraft.

I cite valued third parties, but respect no human or machine as an expert with final authority on any matter whatsoever.

I am doing this completely independently. I have no sponsors or employers or anything of that nature. I am not beholden to anyone for student loans, a salary, inheritance, trust schemes, or anything else. The conclusions within this work are my own, unless otherwise stated or unless considered to be common knowledge within the fields of which I am acquainted. This book is written primarily for scholarly, educational, moral, and ethical purposes. Due to certain areas of contention, there may be some asymmetries in the focus on certain topics. Because it has not been edited by specialists in the various fields, and neither has it been proof-read or copy-edited by another pair of eyes, there are likely to be colloquialisms, grammatical errors, spelling mistakes, typos, blunders of style, and issues relating to concision. Also, there may be occasions of weak language such as "possibly," "probably," "maybe," "perhaps," and so on where it is not at all necessary, though often it is due to the nature of certain claims' foundations in testimony or gaps in my own knowledge. Also, there is possibility of overcorrection, particularly as it relates to digital corrections. For instance, on at least one occasion I have caught myself using the "replace all" function in the program so as to correct for grammatical errors but accidentally changing web addresses in the process. Other such instances of overcorrection due to the conveniences of technology may not have been caught in this round of editing, though I have taken special care so as not to affect addresses. While the footnotes can be largely read over, they are of use to those wishing for clarification in certain areas, for citations, and for further discussion, but they are the least edited of all. Finally, I have had to make compromises in formatting due to the word processor re-arranging text when placed in more optimal positions, and this has left me less than

contented in some cases with the aesthetics of the pages. For these reasons and more, I do ask the reader to proceed with due empathy regarding these areas, as this work has nonetheless required a monumental undertaking of much effort, including a great amount of cross-disciplinary study, introspection, writing, editing, and formatting to achieve the actual substance, which is well worth reading past the blunders. I also ask the reader to do one's own thinking and to use one's own moral compass. Afterall, if a Mutualist society is to be pursued further, as is hoped for in this book, one will have to start getting used to reading the works of one's imperfect and often unsupported peers, as a free society is one in which we hear each other out, imperfections intact, so as not to let a small number of institutionalists control society as a priesthood of knowledge.

This is a living text. I will update it as I feel spiritually compelled to.

Dethroning Einstein *Et Al.*

The worldviews of esteemed scientists such as Albert Einstein, Werner Heisenberg, Alfred Wegener, Charles Darwin, and their ilk, are incoherent with what is known of Nature. This does not mean that they are not rational or logical when taken unto themselves—in a vacuum, and internally, they are logically consistent—, but that they do not cohere with the rest of reality, and so are not sound or cogent. They don't fit the world.

These efforts represent attempts to attack the Western Art of Memory, which is founded in coherence as a successor of such things as Buddhist-style koans or wisdom sayings, the likes of which are often mutually contradictory and not systematic when taken as a whole. By interrupting the learning process with incoherent information, the elites can disrupt one's *sapience*, one's level of learning and morality. This disruption to one's sapience can be fought by becoming aware of what is happening and by taking action to seek out alternative perspectives with which to contrast the information. With a wide enough array of even contradicting sources, one can begin to sift out the coherent from the incoherent information, and thereby put together for oneself a better worldview. To do so is an act of radicalism and heresy, of free thinking and truth-seeking.

Rebellion begins with *suspended judgement*, the foregoing of judgement to understand an idea as a whole first, so as not to be prejudiced in a state of unlearnedness. Then comes *active listening*, learning with the intention of knowing the material so well it can be repeated back in summary. Only after suspended judegment and active listening should one engage in *discernment* or *critical thought*, rejection of wrong beliefs and adoption or retention of correct beliefs. We know beliefs are wrong or right according to how well they cohere with the other things that we know. This process is guided by our intentions or conscience, but is met by material limitations. Our goal is to steer through the material limitations so as to achieve the ends of our intentions, by using our conscience. By informing our conscience, so that it may better perform its duties, we become more sapient, or wise. This method involves common people testing their own ideas with other inquiring minds by putting them out into the world to be challenged, even disproven, by others, such that wrong beliefs can be let go of and ideas that can stand are held onto, and so favors freedom of speech to allow for conversations between common people to spread information widely for public consideration and rejection or adoption.

The free thinking and truth-seeking approaches run directly counter to the postmodern approach to science, which has become an effort to place polarizing labels such as *pseudoscience* on ideas that are either simply wrong, or that are otherwise philosophies improperly labeled *science*; or that mix science with religion, but that might nonetheless contain interesting concepts worthy of investigation, as might be the case with some of the quantum mystics, like Amit Goswami. To some extent, however, being

called a *pseudoscientist* might work to the elites' advantage,[2] as they can hide behind a veil keeping their ideas relatively secret simply by being unheard of, while non-elite investigators and fringe scientists who receive the label do not maintain the fraternal support to maintain a following counter to the systemic repression of "pseudoscience."

As with other things, the label *pseudoscience* is not necessarily wrong, especially when considered in a vacuum. Some views are indeed unscientific, or do indeed claim to be scientific when they mean philosophic. But these views can be just as simply labeled *wrong* or *mistaken*. The job that *pseudoscience* does is not to provide any more useful information, but to provide information that is damaging for the user and the society that the user is a part of—a "sin" or "vice," a sort of self-harm—, by causing polarization. Nobody wants to be wrong or mistaken, but science allows one to come back from that, as science even expects strong minds to be wrong from time to time, and good scientists often work to disprove their ideas, as with the "null hypothesis" approach. When one is accused of pseudoscience, however, this is not something that one can as easily bounce back from, because it is a polarizing label. One is not simply wrong or mistaken, is the idea, but malintentioned or misaligned too. Most importantly, and perhaps more recently resulting from the slippery slope this has caused, pseudoscience involves a misalignment with the standard or institutional model, that which is essentially "canon," or acceptable. In other words, a pseudoscientist is, in our day and age, equivalent to a heretic.

For the above reasons and more, being myself an avid heretic, radical, free thinker, and truth-seeker, I have sought out alternatives to the Einsteinian-Heisenbergian-Wegnerian-Darwinian worldview, beginning with an investigation of those who they are claimed to have deposed, such as Ernst Mach, Paul Dirac, John Joly, and Herbert Spencer. Doing so has led me to a completely different worldview, perhaps conservative in some respects, despite my own radicalism, reflecting a time before the infiltration of science by *synarchist* interests, those of secret government. This worldview is one of eternalism, neutral monism, an expanding Earth, and teleological evolution. I believe the Universe to be eternal, entropy to be counterbalanced by syntropy, the Earth to go through periods of growth and stasis, and evolution to reach toward perfection.

Heretics, Radicals, and Mutualism

The value of this work does not stop at its being a compiled effort of natural history and moral philosophy. In our postmodern society, criticism, dismissal, and critique are rampant, while such things as agreement, acceptance, and faith are in quick decline. You can find criticisms of just about anyone these days, of all of their ideas, belitting them and breaking them down in some way, "deconstructing" them and their efforts. But who is coming through with solutions? Who, instead of breaking everything down, is putting on a constructive effort? In specific, this is a work about heretics, radicals, and especially Mutualism. It has a specific focus on *mutualism*, or reciprocity, particularly as it relates to humanity, and especially as engaged consciously by humans. When mutualism is gone about consciously, with intention and know-how, it is called *Mutualism* with the big *M*.[3] That's my solution, and it is what you can find in this philosophical natural history, whatever its imperfections.

---

[2] Goswami perhaps representing such a case

[3] The big *M* denotes a self-aware social movement that consciously supports mutualism of the small-m sort, Mutualism's biological basis. This book, then, gives a Big History of mutualism, especially as it developed from cosmological and biological processes into the thought and practice of the heretics and radicals who would come to embrace *conscious mutualism* (something like *conscious evolution*), which gets a big *M*. Small-*m mutualism* is reciprocal, beneficial relations, but *conscious* mutualism, or *Mutualism*, is about the conscious pursuit of mutual benefit in relationships, especially as an expression of enlightened self-interest, rational egoism, and justice.

Mutualism is addressed in both the capitalized form, as *Mutualism*, and in the lower case, as *mutualism*. This is because mutualism is a generalized theme, while Mutualism is more of a special focus. With a small *m*, *mutualism* refers to any relation between organisms that is beneficial, including those between humans of all classes. With a big *M*, *Mutualism* refers specifically to a particular social movement promoting the conscious practice of mutualism between humans.

Mutualism is addressed in a wide sense, as a general tendency in living things and especially humankind, and in a narrowed-down sense, as a particular philosophy and course of working class action. Heresy and radicalism find themselves as the backdrop for the deep history in which mutualism was expressed and from which Mutualism has developed, providing clues to the orientation of Mutualism that are often left unconsidered in a narrower focus alone.

Mutualism, in both the small *m* and big *M* senses, comes from *mutuality*, as in jointly beneficial, and describes the relationship and/or ideology of reciprocity. It may have etymological relation to the Roman *mutuum*, a loan for consumption.

In the wider sense used in this book, mutualism, with a small *m*, is used to refer to any reciprocal or mutually-beneficial behavior, explicit or not, conscious or not. This is much as it is used in the context of biology, but is here perhaps more anthropological. Any kind of behavior that can be considered to be mutual between a given set of participants *is* mutualistic to the degree that it is in fact *mutual*. Any human person, regardless of their socio-economic or political position, can participate in such a mutualism. As such, we will find interest in the succession of mutuality, the displacement of older by newer forms of mutualism. An example of an older expression of mutualism is the fealty between the nobles of medieval Europe, and an example of displacement is the removal of that noble control by the mutualism of the burghers and merchants who established republican government in place of aristocracies and royal families. This wider sense of mutualism necessarily does not have the somewhat puritanical flavor that the narrower sense of Mutualism, discussed later, oftentimes and— in the hands of Leftist anarchists, especially— unfortunately does.[4] Rather, it simply describes human aspirations and endeavors in the *anacyclosis*, or "political cycle."

Heresy is a word originally meaning "choice," referring to a lifestyle in which one analyzed different religious beliefs and chose for oneself what to believe. Later on, a similar concept would be found in "free thought." Sources for heresy included native or traditional folk pagan beliefs, rogue scholars or preachers, and mystics of various sorts, but also atheists and materialists. They would often promote

---

Conscious mutualism is like conscious evolution, because the evolution of social animals has been driven by unconscious mutualism, and human evolution has required increasing degrees of conscious mutualism. This big-*M Mutualism* is a modern socioeconomic philosophy that favors freedom, equality, and fraternity over authoritarian control of any kind. This differentiates Mutualism from capitalism, communism, and nationalism or fascism, all of which require political authority while Mutualism does not.

[4]There is a toxic tendency in the contemporary Left for one to dissociate from and "deplatform" anyone who doesn't think in very similar ways to oneself. This has kept many Mutualists (largely under the influence of anarcho-communists, but also Left market libertarians) from working with common people who do not share their more particular cultural views. This tendency runs contrary to the original milieu of radicalism and free thought from which mutualism has, time and again, convergently evolved.

Mutualism in human societies shows itself strongest when diversity of ideas are appreciated and knowledge is seen as a comparative and multidisciplinary affair. Knowledge should involve eclecticism, syncretism, integralism, compatibilism, dialectics, or something similar in approach that combines insights from competing perspectives. Nonetheless, for eclectic views to do anything concrete, they must be solidified into traditions. A plurality of traditions, surrounding the ultimate Truth, but in competition with one another as to its interpretation, has been described by the antiquarian scholars as the *perennial philosophy* or the *prisca theologia*, and was found among Gnostics and Essenes and other truth-seekers of the day.

doctrines such as pantheism, neo-Platonism, and gnosticism of various sorts, as well as secular views from sources such as the Ancient Greeks, and Christian beliefs in unitarianism, univeralism, or millenarianism. Heretics would often be anti-clerical— opposing the ecclesiastical authority of the Church—, and often overlapped with and fueled political radicalism, such as opposition to the feudal authority of nobles and monarchs. They would, at the time, form communities, convents, and secret brotherhoods in which their esoteric knowledge would be passed along.[5] Heresy would become grounds for religious persecution under the authority of the Church, pressing many heretics underground.

Radical is a word that means "root," and refers to an approach that gets to the root of an issue. Naturally, this involves "critical thinking," the act of discerning truth or making judgements, particularly in relationship to their consistency with more foundational or fundamental principles. Radicals look to the foundations of ideas, and disregard constructions that are not logically consistent with those foundations. Radicals tend to be critical of authority, certainly of monarchical government, but often of representative government as well, commonly preferring direct to representative governance. They are sometimes considered to represent the "Left" wing of republican or classical liberal thought, and contain diverging views consistent with *laissez-faire* libertarianism and democratic socialism. Radicals—liberals and socialists among them— often supported universal suffrage, public education, the rights of small business, and the fairer distribution and security of property. Radicalism grew out of heretical religious beliefs.

Heretics and radicals alike reject the notion that truth emanates from, or has its source in, authority, which is to be respected and obeyed at all times. Heretics and radicals are free and critical thinkers, sometimes having magical views like Giordano Bruno, but often depending upon empirical, rational, or otherwise reasonable or demonstrable explanations for their beliefs. Religious and political authority is not self-justifying, but is a social convention, and heretics and radicals question the extent to which this convention serves its intended purposes, and whether or not those purposes are respectable.

Mutualism, in the narrower sense, with a big *M*, refers to a specific socio-economic philosophy which was informed by a longstanding practice passed down by pantheists and other heretics of the working classes—particularly, but not exclusively, among the textile industry—, and by lay preachers and lower clergy. Mutualists of this sort endorse reciprocity as a value of fundamental importance, and this value reflects in their social and economic tendencies toward federalism, mutual aid, and cooperation, and often displays itself even in their cosmologies.

Will You Face Your Fear?

You are in danger, but unaware of it. You find out about the danger. Now, all of a sudden, you have fear that you did not otherwise have. You are terrified. This is horrible.

Without knowing, you would be in the same danger. But you would not know that you are in danger, and so you would be even more available to it. But, you would not fear, either. The fear itself is uncomfortable. Can't you just feel normal again?

But, without the fear, you might actually get harmed. It is the fear that protects you.

---

[5] The tradition of passing along secret knowledge through secret societies or cults goes, historically, at least as far back as Pythagoras, and is also found by archaeologists and anthropologists among the cults of technologically primitive peoples.

Yet, so many people are afraid to know the truth because to know the truth is concerning.People, so it seems, enjoy their fantasy-existence that has apparently been enhanced by religion, fiction, and other manners of lies. With their blinders on, and threatened by anyone who might recommend to remove those blinders, people tread forward to the slaughter reading their bibles, watching movies, and playing games, not paying attention to their fleecing along the way. The fear of fear is enough to keep the blinders on.

The truth is that religions, governments, and power brokers, who so dominate, slaughter, and fleece us all, depend upon this behavior. If you were to face your fears, you would become a challenge to that which threatens you. You would also learn better how to secure yourself from its encroachments. You wouldn't want to do that, would you?

This book has much that is scary about it. It has a new outlook on Nature that will almost certainly challenge your present worldview, no matter whether that worldview is grounded in the natural or living sciences, philosophy, history, or religion. Christians, Jews, Hindus, Buddhists, atheists, Republicans, Libertarians, Communists, Socialists, and anarchists alike will feel threatened from time-to-time by this work revering and exploring the magical mundane, the unseen, and the deeply philosophical. At the same time, this work embraces the natural and moral wisdom of the ages.

Words like *heretics* and *radicals* may be considered to be negative, particularly to the conservative reader. To such a reader, a *heretic* is someone who goes against the Biblical teachings of the Church. A *radical*, to the conservative, might likewise suggest that one holds onto extreme beliefs. But there are a few things to consider.

It is important to remember that, unless one is the most traditional Catholic, most of the teachings of modern Christianity would have been, or in fact historically had been considered, heretical. All of Protestantism was, at one time, heresy. Anabaptist, Protestant, and even modern Catholic teachings of today would fall under this category for the Catholic Church of old (who most famously persecuted the heretics, particularly during the Inquisition, and not much differently from the Roman persecutions of the early Christians). Many, if not most Christians, of today, would be persecutable by the Church as heretics. So don't be afraid of that word, *heretic*.

Today, it is increasingly the case that political conservatism is considered to be an extremist belief, particularly paleoconservative beliefs rooted in personal or common law, classical republicanism, British Israelism, neo-patriotism, and the like. These beliefs are often associated with the *radical* Right because they seek to address *fundamental* issues, and a *radical* is someone who gets "back to basics" by engaging the fundamentals. Are you starting to see the trend here? If you are a conservative, don't let that *radical* word scare you off. In some ways, though probably not all, *you* are a radical too.

Liberal and Left-leaning readers should not be put off by this appeal to the populist Right, either. While Mutualism certainly has affinities with the common law tradition, radical republicanism, and other ideas associated today with the Right, Mutualism has historically been considered to be a part of the Left, particularly the Old Left, and for some good reason. Mutualism is a *socialist* ideology, in the small-*s*, pre-Marxist, sense of the word, meaning the desire to disperse wealth and power rather than to have it concentrated.

Don't get confused, conservatives, I have no desire to take away your freedoms! Before Marxism, socialism was basically anarchism, such that the distinction between *libertarian* socialism (like Mutualism) and *authoritarian* socialism (like Marxism) was largely unnecessary. This distinction didn't exist at all until the rise of Marxism. The pre-Marxist, libertarian socialism was itself an outgrowth of

the classical liberal and radical republican tradition that many of the populist Right folks, who are into common law, sovereignty, federalism, and all of that stuff, are often drawing upon. So Mutualism is by no means a conservative ideology itself, though neither is it a New Left one. Mutualism is classically liberal, classically socialist, and classically republican.

You must understand the word-games that have been played throughout history. Words have changed meanings, and this has occurred through new uses of those words that have been popularized by elites and their influence on the arts, humanities, and education. Words like *socialism*, *anarchism*, *privilege*, *profit*, and so much more have been completely distorted from their original meanings. Today, *socialism* is not, as it originally meant, an economy free from concentrated power, but instead means government control. *Anarchism* is no longer a philosophy of self-government established upon personal responsibility, but instead means chaos and disruption to society. *Privilege* no longer means government favoritism to monopolies through law and licensing, but instead refers to the color of a person's skin or the shape of their genitalia. *Profit* no longer means "unearned income," as it still does in proper economics, but has come to mean "earnings." The reason that these words, and so many more, have been distorted from their original definitions and uses, as used by Enlightenment and modernist philosophers long past, is so that you will reject what I have to say before I say it, so that you will reject what has been said out of *cognitive dissonance*, disagreement with your preconceived notions. To make matters worse, these preconceived notions have been deeply instilled in you, though indirectly, by those who fleece and slaughter you.

The above being the case, I employ a certain amount of what has been called *horseshoe theory*, that when one goes far enough Left or Right in the political spectrum, one finds certain undeniable affinities between the Left and the Right. The reason for this may be that the far Right and the far Left have been largely teased away from one another in an effort of "divide and conquer." As such, rather than presenting an alliance of Mutualism with the Left— as is fashionable to do under the banner of "Left Unity," to much satisfaction of the Marxists—, Mutualism is here presented as a Center ideology, from which both Right and Left-wing readers can gain much insight. This is not to say that Mutualists are "Moderates" in the contemporary sense (though moderation is not a value Mutualists oppose), but that Mutualists, however still radical or even reactionary at times, are *dialectical* in their approach, taking value from opposition in order to arrive at a balanced conclusion. Because of this, it may take a thick skin, from readers of both sides, in order to tolerate the opinions explored in this text. But for readers who are used to considering all of the angles, it will be a pleasure to read a Big History from the perspective of Mutualism. The insights gained, and the big picture offered, are well worth the difficulties.

Intellectually exploring extremes allows one to calibrate a more complete mental picture. It is like experimenting, wherefrom one can learn by way of trial-and-error. By thoroughly considering what communism or fascism might be like, particularly when considering both, and by way of (long enough) pure introspection from one's own observations, one can come to the conclusion on one's own that such extremes are undesirable and that something in-between would be best, something better-rounded. There are some, it is true, who are prone to cling to extremes as vices, and in such cases the expiriments can be performed before our very eyes.

It is up to you whether you want to know about the world you inhabit or not.

You can continue to play video games, go to work, go to school, go to Church on Sunday, and etc. You can continue to be forced into stupidity, tenancy, debt, and employment by others, paying taxes that are spent on hush funds so that politicians can molest women and children and to fund unjust wars and civil unrest and tyranny at home. You are being force-injected, genetically-modified, and exploited, all

while blaming your peers for your problems instead of the real culprits, not knowing this makes you the biggest culprit of all. You blame white people, black people, Jews, men, women, Bush supporters, Clinton supporters, Obama supporters, Trump supporters, Bernie supporters, Biden supporters. You blame anyone but your preferred politicians, bankers, landlords, and bosses, who are all too happy to fleece and kill you slowly, and who come in all shapes, forms, and colors. You will certainly have less fear if you continue in this way, in your wicked fantasies and delusions. If your goal is to avoid fear, then you probably do not want to read this book. You want to keep going to church, watching television, reading fiction, and playing games. You want to keep voting, campaigning, and hoping that others will save you while you do nothing to develop yourself. This book is not for you.

But if your goal is to think for yourself and explore unknown ideas and new ways to see the world, if your goal is to live a real life and to embrace its challenges as part of the epic story you are part of, to challenge those who would fleece and slaughter you, *this* book, in particular, is a great start. I think it's better than you will find elsewhere.

CONTENTS

Preface **5**
Is This Book for You? 5
Extended Preface **7**
Method and Motive 7
Dethroning Einstein *Et Al.* 9
Heretics, Radicals, and Mutualism 10
Will You Face Your Fear? 12
Contents **17**
The Age of Cosmological & Biological Mutualism **1**
Truth and Falsity 1
Metaphysics and Myth 10
The Cosmos 24
Biophysics 33
The Stars and Planets 41
The Earth 46
Life on Earth 61
Eons and Epochs 75
Sociality and Agonism 85
Mutualism, Convergence, and Hybridization 87
Archaic Primates 96
Giants and Cryptids of Myth or Legend 114
Sexual Dimorphism 121
Human Speciation 125
Human Mind 130
Conscious Evolution 142
Races of the Stone Age 145
Socioecology 170
Hunter-Gatherer and Stone Age Society 179
The Age of Cosmological and Biological Mutualism 182
The Age of Aristocratic & Noble Mutualism **183**
Borean Albinos 183
Mediterranoids 190
Horticultural and Copper Age Society 198

Copper Age Economy 207
Leagues, Political Agonism, and Co-option 217
Caucasoids, Mongoloids, and Americanoids 219
Culture and Ethnicity 230
Hyperboreans, Aryans, and Turanids 237
Hybrids and Convergence Zones 249
Agricultural and Bronze Age Society 255
Race and Caste 260
Bronze Age Economy 263
Esoteric and Exoteric Religion 269
Homosexuality 279
States and Governments 281
Egyptians and Canaanites 286
Indians and Iranians 295
Greeks and Romans 298
Thracians and Scythians 303
Dravidians, Jats, and the Jat Belt 308
Nordids and Congoids 316
Celts and Germans 324
Iron Age Society 328
Tibet 333
Crazy Wisdom 336
Philosophy and Religion 344
Ancient Pantheism and Luciferianism 349
Anglo-Saxons, Jutes, Franks, and Normans 354
Bedouins, Radhanites, Slavs, and Turks 361
Mystery Cults and Perfection 369
Abrahamic Religions 376
Nordic Judaeo-Christian Rulers 386
Feudalism 392
The Age of Aristocratic and Noble Mutualism 400
The Age of Genteel & Bourgeois Mutualism 402
Medievel Communes 402
Fraternalism 404
Islamic Golden Age 407
The Proto-Reformation 411

Medieval Pantheism and Millenarianism 414
Free Spirits 419
Radical Reformers 424
The Renaissance 434
The Age of Discovery 441
The Reformation 445
Natural Magic and the Scientific Revolution 450
Religious Dissent and Freedom of Thought 457
Rosicrucian Enlightenment 464
Approaching the Certain and the Concrete 468
Christianity Not Mysterious, but Old as Creation? 471
Modern Pantheism and Luciferianism 480
Dualistic Pantheism 485
The Enlightenment 492
Radical Enlightenment 494
Moderate Enlightenment 500
Kabbalah and Haskalah, the Jewish Enlightenment 502
Political Philosophy 503
Freemasonry 508
Strict Observance 511
Counter-Enlightenment 516
The Great Awakening 521
Republican Revolutions 526
The American System and the "Civil" War 530
Industrial Capitalism 538
Republican Governments and Capitalism 542
The Age of Sensibility 545
Common Sense Realism 551
New Religion and Greater Awakenings 555
The Age of Genteel and Bourgeois Mutualism 559

The Age of Farmer & Worker Mutualism 561

What is Mutualism? 561
Mutualist Origins 564
Religious and Irreligious Influences 567
Mutualism and Christianity 570
Prisca Theologia, Perennial Philosophy, and Mutualism 572

Unitarianism, Universalism, and Friends 575
Mutualism and Freemasonry 576
Mutuality a Product of Eclecticism 578
The Orientation of Mutualism 580
Modernism 585
Modern Mutualism 591
Self-Help and Good Character 594
Property and Markets 599
Mutualism and Cooperation 603
Voting, Federalism, and Law 611
Civil Society 616
Unionism and Syndicalism 618
Community Projects 623
In the Netherlands and Germany 625
English and Scottish Mutualism 629
French Mutualism 633
French Rebellions and Communes 639
In the United States 642
Elsewhere 648
Near Misses 651
The Golden Age of Realism 653
Fraternalism In Practice 658
Mutualism and the Anglo-Saxons 663
Racial Separatism and Intraracial Mutualism 666
Bakuninism, Marxism, and Austrian Economics 673
“Modernism” and the *Fin de Siècle* 681
The Great Game and Synarchy 686
Conspiracy Theories 696
Postmodernism 703
“Anarcho”-Communism 707
Progressivism 714
Fascism 722
The Postmodern Era 732
Neo-Anarchism 741
The Class System of the United States 755
Accidental vs. Essential Properties, Discrimination vs. Bigotry 764

Mutualism and WASPs 770
Mutualism and the Jewish/WASP Conflict 774
"Black" and "White Anarchism" 779
Laying the Dog to Rest: Power is Not the Enemy 785
Scientific Jiu-Jitsu 790
Neo-liberalism, the Alt-Right, and the Great Reset 793
The Seat of Power 809
Decline of Mutualism 819

THE AGE
OF
COSMOLOGICAL & BIOLOGICAL MUTUALISM

Touching upon the fundamental basis of mutualism's existence in cosmology, biology, and in primitive society

Truth and Falsity

Epistemology refers to the study of knowing and how one knows the truth or not. It is one of the most ancient pursuits of philosophy, extending beyond the reaches of wise observations and deep into the realm of *causality*, of the causes of things. In popularly known history, epistemology was a strong focus among Indo-Europeans such as the Greeks and the Hindus of India. In both cases, epistemology was essential to answering questions regarding *ontology*— the study of what is and how things came to be as they are—, as "How do you know?" became the quick retort to ontological claims. Among the Hindus, epistemology was the pursuit of *pramana*, or "proof," around which developed various schools of thought. These focused on whether knowing came from direct perception or *observation*, when one knows by experience; *inferences*, or logical derivatives; comparison or *analogy*, when something is suggested to work similarly to another; or *testimony*, that which is claimed by others.

The Greek philosophers were especially concerned with *inference*, the abductive, inductive, and deductive forms of knowing. *Deduction* is the derivation of truth by way of inference by definition, utilizing categories. For instance, a famous example of this is "All humans are mortal. Socrates is human. Therefore," by fitting into the category, "Socrates is mortal." In deductive reasoning, conclusion necessarily follows from the premise, such that if the premise is true, the conclusion must also be true. *Induction* is inference of likelihood from repeated observation through the senses (sight, hearing, touch, taste, smell). For instance, from observation, "Socrates thinks. Plato thinks. Aristotle, too, thinks. Philosophers think." In this case, it is highly likely that philosophers think, based on repeated observation that the philosophers Socrates, Plato, and Aristotle think. *Abduction* is a guess or prediction based on incomplete information. "Aristotle was here. Plato's book, *Republic*, is open. Aristotle opened the book." An abduction can be false without being anomalous or improbable, owing to missing information (what if Theophrastus came by and was not known to have done so?).

Highly religious, less secular societies around the Greeks, such as those of the Germanic and Iranic Scythians and the Semitic Jews and Egyptians, as well as many of the more distant Hindus in India, focused on other areas. The gambling among Germanic and especially Semitic societies, for instance, is probabilistic thinking that, while also related to induction or abduction to some extent, might be considered more related to pure "luck." Germanic,[6] Iranic, and Semitic societies engaged in much analogizing, as is found in their mystical religions, myths, and parables, and postulations that suited

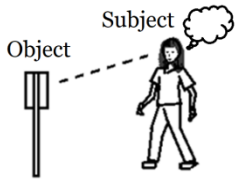
[6] Among the Germanics, the Saxons and Frisians, while still prone to myth, stand out as also having had much common sense and capacity to reason, as is demonstrated particularly strongly in their customary and then common law systems. When considering these systems, it is not out-of-place to suggest that the Lawspeakers of the Saxon and Frisian Things were themselves practical philosophers of a sort, or, perhaps more appropriately, "wise men." While this may be said more generally of Indo-European societies, so as to also include the Celtic Brehons and Vedic Lawseers, and virtually all pre-statutory law systems, Saxon and Frisian society is unique among the larger Germanic societies (such as the Franks and Goths) in their maintaining natural law elements for as long as they did, holding out against the Romans, Goths, and Franks, all of whom worked to push Christianity and statutory law onto the Saxons and Frisians (as well as the Celts). Under customary law, the law was not declared, but was discovered as a fact of Nature, while statutes were the decrees of human beings of inflated worth.

their risk-taking gambling behavior well (as they would have to be tried). They, as well as many of the Hindus, followed the testimonies of wise men, sophists, and priests, and the claims of direct perception belonging to prophets and soothsayers. They established caste systems and feudalistic societies from their epistemologies, *pramanas* that ultimately served the powerful members of the society by privileging the observations, testimonies, and analogies of the rich and forgiving the belligerence of their postulates. This allowed the elites to rule more emotionally, according to their taste, rather than according to common sense or public reason. In India, it would be the atheist Caravakas who would counter the claims of the religious the most strongly.

While the same religious forces also took place among the Greeks, theirs was among the first of societies to move toward secularism and democracy, and this was founded especially upon inference, upon induction and deduction (as well as an unannounced abduction), which moved the Greeks beyond basal, emotive passions. Greek secular philosophy spread widely, eventually influencing and changing the entire world, though not purely so, not even within its own borders. Unlike the effect of establishing central authority that the Semitic, Germanic, and Indian societies were having, the Greeks were establishing a little more social equality. At the same time, this was making them powerful as a culture and as a society, rather than weaker, and the Greeks spread their Hellenistic culture widely as a result, nearly becoming a world empire. But, alas, the remaining elements of the caste system, the Greek ruling class, were not contented with a strong and healthy society, seeing the development of commoners as running against their own interests as rulers, and so the Greeks, under the leadership of their rulers, would decline, the first signs of which was the imperial model itself. Greek society had become relatively powerful through philosophy, but became absolutely weakened by the rulers' thirst for more, leaving the Romans to pick up where they left off, starting the cycle anew, the once-noble Roman Republic then faltering and declining into the Roman Empire. This same process continues on to the present day with the American Empire, itself the product of an earlier philosophical Enlightenment. Thus, it may be said that the truth is the locus of power, supplies power to its wielder, but that the bare thirst for power itself takes one further from the truth.

The *truth* is ultimately that information that corresponds to the way things are. One can believe something that is not so, and that is false, or one can believe something that is so. Those beliefs that correlate with what is so are true, and come in three forms: objective, subjective, or relative, and Absolute. The *subjective* is oriented within the subject, as a state of emotion or evaluation, while the *objective* is oriented toward an external object, an observation.

Objectivity has a number of definitions. Perspectives that are understood to be objective are often those that lack emotional or preferential content, that reference a thing that exists independent of one's awareness, or that reference something from the outside, including through logical explication. An objective statement would be "The ball is round," as its roundness is not an emotional claim, but refers to an object that exists even when no one is looking, and which, under the right conditions, can be witnessed by others besides the individual making the claim, can be seen by anyone with eyes to see. When objectivity is mutually held with others, as when another can behold the *referent*, that being referenced, one's claim is said to be *interobjective*, or *objective* in a shared sense. Objective observations that cannot be demonstrated to others may be called

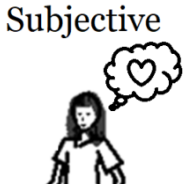


intraobjective or *relative*.[7] Further, when there is subjective agreement, as is the case with *intersubjectivity*, the perspective might also be said to be objective, though not universally so. In such a case, *objectivity* refers simply to any perspective that is agreed upon.

In the field of journalism, journalists are supposed to be objective. This does not necessarily imply that they do not have emotions that can be reported on, but that the journalists do not mix their own emotions into the scenario (or are not supposed to). The expressed emotions of others are reported on objectively, as facts of the journalists' objective experience, such as statements by those others. In the fields of the natural sciences, something is understood to be objective when it can be referenced from the outside for observation. In other words, a perspective is seen to be objective when it references an object that can be observed by others. While also not themselves objects, ideas can nonetheless be expressed in an objective fashion through the use of facts and logic, including mathematics and figures, by which others can come to the same conclusion. Feelings, qualia, cannot be referenced in such a manner, because people's opinions and tastes oftentimes differ.

Objective statements describe the material, physical phenomena of objects quite well. They also describe metaphysically "ruled" phenomena such as logic and mathematics, and in a way that is relatable to others. Those who want to see something that has been objectively referenced by others are likely able to do so, and so proof may be established. Objective statements are true statements, and are true outside of preference or bias.

	Subjective	**Non-Subjective**
Objective	Absoluteness	Objectivity
Non-Objective	Subjectivity	Falsity



Something is said to be *subjective*, however, when it represents personal opinions, taste, feelings, and such. Perspectives that are understood to be subjective are those that are composed of value-content, such as preferences, and emotions regarding specific conditions. A subjective statement would be "The ball is pretty," as different people may agree or disagree. Our own experience is considered by others to be highly subjective, unless it is agreed with. When others disagree with our subjective tastes, our tastes are *intrasubjective*, or our own, while agreement of subjectivity is *intersubjectivity*, sometimes considered objective.[8] However, even if our statement is objective in orientation but unrecognized by others, such as is the case with relativity or *intraobjectivity*, objectivity as witnessed to oneself but unobserved by others, it may at times be called *subjective*.[9] This confusion is owed to different senses in defining the words, most likely stemming from sophistic sources, such as rhetoric

[7] Some consider direct experience of otherwise subjective mental phenomena to be intraobjective (phenomenally real), as though mental "objects" such as concepts or emotions are witnessed by an external self, but this use is not widely employed

[8] This occurs, for instance, when people can agree on something that is mutually desirable between them, such as a shared goal or desire

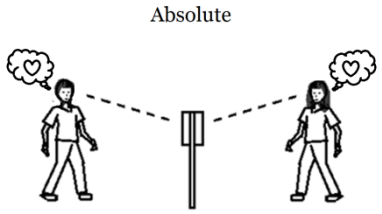
[9] *Interobjectivity*, on the other hand, is when objectivity is able to be witnessed by others. This sort is not considered to be subjective.

and philology, and perhaps even purposefully to cause confusion between objectivity and subjectivity, the relative and the absolute.[10]

People have their own priorities. While we may be able to describe conditions in an objective sense, this tells us nothing about human emotions, which are independent of, but that "interact" with, objective phenomena. We may be able to objectively describe a selection on a shirt rack: "There are red ones, yellow ones, blue ones, and green ones of all sizes and styles," we may say. This does nothing to tell us about choices, or to describe why we have racks from which to pick in the first place. Yes, objectively there are different styles, but this is so because, subjectively, people have different priorities, and there is not one objectively "best" color. Each actor feels they are deciding upon the "best" color when they make a selection. Preferences are unpredictable and unable to be proven. We can't calculate for another person what will be best for them, nor can we calculate our own future. None of us live according to a strict path. Such a plan can do nothing but lead to restriction of spontaneity and the impoverishment of the human spirit, which flourishes on new experiences and engagement with new opportunities. Such new experiences and opportunities, however, approach us according to conditions that are outside of our control. We cannot anticipate them. If we are unable to predict our own desires, how can we expect to predict the desires of others, except in the most general sense (we will want to eat, sleep, have sex, etc.)? We cannot.

	Subjective	**Non-Subjective**
Objective	Absoluteness	Objectivity
Non-Objective	Subjectivity	Falsity

Absoluteness exists when all possible perspectives are in accord with one another. That is, something is absolute when it is agreed upon by all parties (with the capacity to understand and when being honest), especially when there is agreement between subjectivity and objectivity. Sometimes *objective*, in the sense of interobjective or intersubjective, is used as a synonym for *Absolute*, in which case it may be, though is not always, capitalized, such as in *Objective*.



Few things are absolute. Most are either subjective or objective.[11] Intersubjective and interobjective perspectives approach the Absolute in their own way, representing a degree of absoluteness, or agreeableness, in regard to subjectivity and objectivity. A true absolute perspective is not one that is objective or subjective, though, but one that incorporates and understands both, and the interplay between them. While we are incapable of understanding or having access to everyone's emotions in the specific, we can approximate to the best of our ability the general wants of humanity, especially by communicating with others. While the specifics of our desires are subjective, the general drive of our desires is the Good, which is intersubjective. All want goodness, though differ on the details.

[10] Indeed, relativity and absoluteness are major themes in Buddhism, which would greatly impact European society around the time of the sophists, who themselves were likely fairly familiar with the sort of thinking coming from out of India. Sophists are comparable to Sufis, which themselves have some comparability to Hinduism and Sikhism in India

[11] Subjective perspectives, again, are those that originate in emotions and preferences, or that are relativistic, while objective perspectives have their origins in reference to things, which can easily be referenced by others, or those things that one is sure of having experienced directly.

Absoluteness includes both objective phenomena and subjective noumena, considered together. An objective perspective may suggest that a shirt is yellow and a subjective perspective may dictate that yellow is an ugly color, but an absolute perspective suggests that there is a yellow shirt that isn't very well liked. The subjective perspective does nothing to change things in itself, or to keep them as they are, but neither does an objective description always satisfy the wants of subjectivity. Absoluteness describes the "interactions": when subjectivity becomes powerful enough, it may "affect"[12] the objective reality, and when the objective reality is too influential, it matters not how subjectivity feels about it. If someone hates the shirt enough, they can destroy it, but the hatred without action does nothing to change the fact. The subjective preference must motivate objective action, or things stay as they were. Likewise, we may like the way things are, and may be able to objectively describe the workings of a system, but this does nothing to determine the priorities of others, who may not have an objective example of their preference in action, but who have a subjective preference nonetheless.

Absoluteness reconciles subjectivity's (preference's) relationship to the world of objectivity (fact). That is, it explains how subjectivity corresponds to the external reality of objects, and how the external world of objects limit subjectivity from always having its priorities met. We may not always like (subjective) the way things are (objective), and we may not always see the potential (subjective) in them (objective) either. We may limit our goals (subjectivity) to the way things have been in the past (objectivity), or we may fail to understand how our goals (subjectivity) are limited by the world around us (objectivity).

Absoluteness reconciles the clash between objectivity and subjectivity. According to subjective perspective, things should be one way or another. Objectivity describes the way things are, regardless of priority or preference. Absoluteness describes the conflict or tension between the two. Subjective preferences may not like things the way they are, or, alternately, may like them very much and not want them to change. This does not mean that things will be as subjective experience dictates, however. Unless subjectivity can find a means to correlate its preferences with objective fact, subjectivity will be in conflict with it, and that will be the absolute fact. Absoluteness is what *is*, and what is often appears as manifest contradictory forces.

	Subjective	**Non-Subjective**
Objective	Absoluteness	Objectivity
Non-Objective	Subjectivity	Falsity

When one has what one believes to be absolute knowledge about a thing, one feels a sense of completion, but there is ever more to know, and the drug wears thin. We can have a sense of contentment and completion for a moment, but it is always fleeting, as the purpose of humanity is not to simply thrive in the fulfillment of desires, but to strive in search for such fulfillment. We gain it only temporarily. We hunger to retain it, but we shall not. Not in this lifetime. We will, however, set up the possibility for such a future to be experienced later on, by the very same energy that now makes up our

[12] *Affect* is here in quotes, following after *interactions* similarly quoted, on the grounds that the author does not hold to an interactionist metaphysic so much as one of psycho-physical parallelism taking place within a neutral monism, and wereby the neutral Substance is responsible for what we perceive as interactions and affects between that which is mental, or subjective, and material, or objective. Nonetheless, these terms are employed by the author pragmatically, with regard to the common sense experience, which perceives some kind of "interaction" between mind and matter.

bodies. Afterall, this has been done before our current consciousness, and is the reason we're here to experience life as humans to begin with. Absoluteness is completion. Embrace it.

Falsity, on the other hand, is the opposite of absoluteness. While absoluteness describes the existence and interaction of both subjectivity and objectivity, falsity describes the lack of truth content in a statement. That is, when something is neither objectively, nor subjectively, true, it is false.

If someone points to a red apple, and calls it "*green*," we do not suggest that the statement is "subjective," but that the statement is false. We can disagree with subjective statements without them being false, but we cannot disagree with objective statements without them, or our own interpretation, being false to some degree or another. A statement about an object that is not true is not subjective, it is false. Likewise, when someone tells us a lie about their feelings, in order to manipulate or take advantage of an objective situation, this is not a reflection of their true feelings, but is a lie. A lie is not subjective, a lie is false. Lies are that which does not exist, but that purports to. The "essence" of the lie, not the words that represent the content, is absence of truth value, and the absence of being, that is, non-essence. To tell a lie is to say something that is not so. The difficulty in this is the fact that we cannot tell when someone is sharing subjective truth (their real emotions or priorities), or when they are telling us a lie (except upon trust). Someone we have known for a short time may suggest that they would never steal from us, because they have already developed amorous affection towards us, but this statement can be motivated by recognition of true feelings within the individual, which they honestly wish to express, or it can be motivated by attempts of trickery, so that they may take advantage of us. While one is a subjective truth, the other is a lie, a non-truth. Lies are not subjective, they are not objective, and they are not absolute (while they must be described in some sense by absoluteness), they simply, ontologically *are not*. That which they reference does not exist, but leads to the detriment of those things that do. While the truth content does not exist, the statement objectively does exist (that is, it is undeniable that when I tell a lie, words come out of my mouth, providing the lie a *nominal* existence, one that is purely rhetorical) and is often unappreciated, or detrimental to one's character, and so bad.

	Subjective feeling	**Lack of Subjective Feeling**
Objective data	Absoluteness	Objectivity
Lack of objective data	Subjectivity	Falsity

It is clear that there are two attributes of the absolute truth,[13] the subjective and objective. These might also be categorized into personal and interpersonal truths to some extent, with intrasubjective and intraobjective perceptions of truth being intrapersonal and intersubjective and interobjective perceptions of truth being interpersonal. The absolute, then, might represent the social, the "super-personal."

In many cases, it is not possible to know the full objective truth with complete accuracy, as many of the finer details of the nature of things may be out of our reach. For instance, objective knowledge may be known about an item on one level, while its history, its microscopic characteristics, and so on may be unknown. Even subjective truths may at times confuse the wielder of them, as when one laughs in pain. When it comes especially to one's actions, oftentimes, one must approximate the truth to the best of

[13] Not all absolute truths are Absolute Truth

one's ability, which may be inexact. When one halves a sandwich, for instance, one does not measure each half according to the number of particles in each side or each side's weight according to nanogram. The most true cut cannot be made, but an approximation of it can be. With the use of a ruler, one's approximation may be even truer. Still, it will be off by a multitude of particles.

Both objective and subjective claims can be made into dogmas, in which case they may cease to be fair approximations of the truth, cease being interpersonal or social truths, and start developing into longstanding falsities. These fallacies begin to restrict new discoveries and applications, and become a source of social and economic stagnation, rendering illness or even death to the social body, society, and even the interpersonal pre-body. In reaction to this, critics of various sorts, from Europe to India, established both folk and sophist conceptions of mysticism that were unreliant upon the demands of the rulers as well as anti-dogmatic, skeptical schools of philosophy, wherein it was suggested that knowledge was either unsharable or unattainable altogether. This served to weaken the dogmas of the rulers, but while further decimating the social body and interpersonal pre-body. Others acknowledged the value of both faith and doubt, embarking on the project of restoring the original goals of truthseeking, and thereby constructing further the interpersonal pre-body and the social body of society. Rather than dogma or skepticism, these individuals focused once again on observation and inference. They established conceptions of common sense, rationalism, and pragmatism, which empowered common people to come to know the truth through their senses, their minds, and through trial and error. And they established social bodies that limited authority, so as to thereby limit dogma, which typically manifests the form of an authority figure. In a way, this may be seen as a continuation of the original trajectory of Greek philosophy.

It seems fair to say that much of the confusion in our world comes from dogmas that themselves confuse the subjective and the objective, that reduce mind to an object or matter to a subject. These are the tendencies today known as scientism and solipsism, coming out in the forms of sophistry known as *logical positivism* and *postmodernism*. While basically opposites, these two tendencies have become standard dogmas that are selectively wielded by rulers according to the demands of contexts and the consequences they create, in the manner of *realpolitik*, or politics according to result, often making use of an enemy's false perceptions or foolhardy goals. For instance, rulers are telling participants in the humanities and sciences alike that physically male humans are women and females, men, according to their mental conceptions. Meanwhile, in the same institution, it is being said that humans are really just machines the mechanics of which came about by pure accident. These ideas have slipped in, in part, by way of the slippery slope of skepticism, which has shaken basic conceptions of reality such that even the most common sense realities are questioned by common people. This is a form of gaslighting, of making others question their own conceptions of reality and state of being. This takes conceptions of reality from concrete to abstract and absurd. This occurs especially from an overreliance upon the testimony, analogy, and luck of rulers and experts.

Still, all of the perennial tools of wisdom and philosophy are there, ready to be re-valued in the context of overbearing gaslighting. Baruch Spinoza, born into a secretly Rabbinical Jewish home, took to philosophy himself largely as a matter of self-therapy, to escape both the religious and ethnic dogmas and to connect with those who were supposed to hate him and that he was supposed to hate as a Jew. It is just a matter of time before these tools are re-embraced by society as they were by Spinoza and the Enlightenment that followed after him. These are the tools of observation and inference, such as by direct experience, trial-and-error, and dialectic, all of which move from the abstract toward the concrete and which, thereby, re-establish the health of the interpersonal pre-body and of the social body of society. Analogy has its uses too, as does testimony and pure luck, but these must be used with special

caution and always must be considered in comparison to a wide knowledge base, to be checked for coherence, as will be discussed.

Still more, the workings of logic, as well as (or, and by extension), mathematics, linguistics, rhetoric, and other arts of the humanities, do not necessarily function according to the workings of the natural world, do not by necessity match nature's contingencies. For this reason it is necessary to show that logic, for instance, is not only workable in itself, but that it fits reality, for it to have anything other than an antisocietal use. A statement can be either true or false, but the argument or logic used to support it may be accurate or inaccurate. *Analogies* can come in the forms of metaphors, allegories, and symbols and are often components of myths, legends, and parables. But, as a form of logic, they are either *apt* or *inapt*, meaning that they are pertinent to the situation or not, and apt analogies are either *congruent* or *incongruent*, being parallel or not to the case at hand, and so accurate or not. Similarly, *deductive* arguments— which are made from definition— that suggest falsity are either *invalid*, in which the logic does not work, or *unsound*, in which the logic itself works out but does not match with reality, both forms of inaccuracy. *Valid* deductive arguments are always true, and so accurate, so long as the definitions of the terms used are correct, and so unsound deductions imply that the definition in use is incorrect. *Sound* deductions are valid and indeed match with reality, being fully accurate. *Inductive* arguments, made from repeated observation of common outcomes, that may suggest that a statement is false are either *weak*, in which case the logic does not work, or *uncogent*, in which case the logic does not match with reality,[14] each being an inaccuracy. *Strong* inductive arguments are fairly probably correct, and accurate, so long as there are no abnormalities or unforseens, and so uncogent inductions imply that a factor went unconsidered. *Cogent* arguments match with reality, and are probably accurate. Those deductive and inductive arguments that can be used to successfully support a statement are sound or cogent. These must correspond with reality. Similarly, *abductive* arguments, which make a prediction from simple observances and incomplete deductions are either accurate or inaccurate, or *likely* or *unlikely* and *concurrent* or *inconcurrent*.

There may be congruent, sound, cogent, or concurrent arguments that support a statement while others do not support it. This involves a contradiction, a disagreement, which implies that a statement, which is always an approximation of the truth, has a significant degree of error, falsehood. The resolution to contradictions by philosophers has typically been to treat them as antinomies, or unresolvable opposites, as having a hierarchical relationship, such as with absolute and relative truths, or to treat them dialectically, to synthesize what is valuable from the opposing positions so as to be able to derive a more concrete statement. *Coherence* is the extent to which statements or arguments are found to be mutually supporting or uncontradicted. The greater the degree of coherence between true statements, the greater the approximation of truth. Falsities mistaken for truths can greatly influence one's perception of coherence, however, and so it is important not to synthesize that which has no analytic truth value whatsoever, and, instead, to regard it as a lie or falsity.

Humans are certainly incapable of fully coherent knowledge as individuals. But, as the medieval philosopher Nicholas of Cusa suggested, it is still a worthy pursuit to try. The Mutualist philosopher William B. Greene referred to this pursuit as the "Blazing Star," which ever moved further the closer one gets, because the complete compendium of knowledge is impossible, though it still beckons to us to approach it. We get further in this endeavor as a society than as a loose collection of individuals.

As one collects knowledge and grows in one's wisdom, one must continually test one's abductions, deductions, and analogies, and must refine one's definitions inductively, by way of trial-and-error. The

[14] Such as by disregarding an important abnormality

Greek and Roman Skeptics had some fair room to suggest that one must act in a world the content of which one is not completely familiar, owing to the mortality of our learning, and the Stoics are correct that it is better to do something than nothing, such that it is true enough that there are gaps in one's learning and that one must at times try one's luck. This led the pragmatists to ultimately resolve with *pragmatism*, the idea that conceptions of the truth are contingent upon what is found to work.

That which is not absolute, or at least interpersonal, is *arbitrary*, functioning according to whim or otherwise being inconsequential or unimportant. When not inconsequential or unimportant, that which is arbitrary can be a source of conflict, particularly when an outcome benefits some but not others. In such a case, arbitration may become beneficial, in which case an outside opinion, agreed upon by all parties, may be sought after to resolve the matter. In absence of a chosen arbiter, or when outside of the scope of a human arbiter's capacity, the default arbiter is *God*, or Nature taken as a whole. God, or Nature, has the final say in what is and is not, in what succeeds and what fails, often ruling according to who is best acquainted with God's will, the laws of Nature. Those who have the most comprehensive, coherent understanding are the most likely to be sided with when in conflict with those who would otherwise be one's equal. Those who know and love God, Nature taken as a whole, are much more informed of the consequences of their actions, and so can much more easily avoid mistakes and innovate solutions to problems, thereby assuring their success.

My statement, or *thesis*, in this work, is that Mutualism[15] is the appropriate *ethos* for society, that mutualism is the evolutionary *logos*, that syntropy[16] is the *telos* of humanity, and that *Natura naturans* is God, the Ultimate. *Logos* might be considered as a sort of singular collective center of moral-rational "gravity" that provides each individual and society with an *ethos*, or moral fiber, and thereby holds the Universe together in connection with the *telos*, finality, representing a sort of narrow, central path to Heaven. In other words, the *logos* is the "The Way" to the *telos*, The End, and *ethos* is the *logos* applied in our own lives. Mutualism, then, is the ethical path of The Way to The End, to Heaven, to Bliss. *Natura naturans*, or Nature,[17] is that which is all-pervasive or *omnipresent*, containing all knowledge or being *omniscient*, being wholly good or *omnibenevolent*, and unlimited or *omnipotent*.

My main argument for my thesis is the coherence of the fairly comprehensive collection of supporting arguments that this is so, beginning with cosmological and biological arguments, arguments from the time of nobles and aristocrats, then gentrymen and burghers, and finally our own time, wherein Mutualism has been developed as a conscious effort of farmers and workers, having met what appears to be an epicycle of defeat, perhaps before arising again for a new dawn. Science, religion, philosophy, and history, taken comprehensively, and when favoring natural facts over pure testimony, cohere to support Mutualism. As such, the reader is presented with a fairly comprehensive look at Nature, as relayed by testimonial observations and inferences, as well as analogies, among them my own and those of others, for purposes of the reader's own consideration. Clearly, the reader will have had exposure to different information from myself— though the reader can count on my general familiarity with mainstream opinion—, such that the reader may conclude differently from myself in some areas. Nonetheless, I believe I make a comprehensive enough argument to, at the very minimum, impact the

[15] Including here fraternal competition and cooperation

[16] Full syntropy, 100%, concluded

[17] *Natura naturans* is "Nature naturing," "Nature doing what it does," or "Nature establishing nature," whereas *natura naturata* is "nature as is established," "nature as has been done," or "natured nature," nature as conditioned by Nature. *Nature*, or *Natura naturans*, is an eternal sense, considering all of space and time as a whole and at once, whereas *nature*, or *natura naturata*, is a presentist sense, considering only the present existence and history of the world.

reader's emphasis toward Mutualism even with whatever *cognitive dissonance*, or discord with existing information, may occur.

To truly test my thesis would require an effort beyond my own ability, as Mutualism is at least an interpersonal endeavor and most typically a social and even intersocietal one. This being the case, Mutualism, if its arguments are accepted, must be taken as a strongly-supported working hypothesis, to be pragmatically tested by society at-large according to the terms of trial-and-error, and not as a final conclusion or dogma in and of itself, especially when considering particular interpretations of *mutuality* that may be less than universally accepted. Still, I believe that, despite whatever errors there may be in my reasoning along the way, I have made a strong argument for giving Mutualism a shot, provided strong evidence that Mutualism is indeed the best *ethos* for society. The truth of the matter, which may even come down to a conflict of belligerents and resistents in less fortunate times, even including physical defense, is up to final arbitration by God, or Nature. I believe that God consistently rules in favor of mutuality, and this is me putting my cards on the table, doing what I can as an individual before others join me in my commitment to this working hypothesis or one near enough to it, whereupon Mutualism can be really put to the test.

Metaphysics and Myth

Metaphysics, meaning "before physics," deals with self-evident axioms and logical principles that necessarily must exist (perhaps more fundamentally so than physics, as the word implies). Metaphysics addresses the axiomatic truths (and logical deductions[18] therefrom) that precede our comprehension or practice of physics. Metaphysical truths that come before physics include *mathematical* and *logical* truths; *ontological* truths about the nature of Being (such as the eternity of the Universe); *subjective* truths regarding our individual aspirations and motives; and epistemological truths about the nature of knowing (such as how we know we exist), among other things. That we exist is simply axiomatic. Here you are, reading this. Similarly, we often know what it is that we desire. We cannot prove it to others, we just *know*. The ontological questions of how and why and the epistemological question of how we know are metaphysical questions.

Physics, of course, is not "the physical world," or *physical reality*, but "the study and categorization of the physical world and its phenomena." Physics happens when our observation of the material world is comprehended in terms of axioms and logic;[19] that is, when we can make rational sense of it, can categorize its happenings or make predictions. Before there is the study and prediction of the physical world and its *phenomena* (material or physical occurrences), by way of induction, there is the inherent fact of the physical world and its phenomena. This is met by the seemingly-contrary *noumenal*, or psychical, existence of metaphysical categories, which are innately experienced and sorted deductively. From a certain perspective, the categories precede the physical world and orient it, which is why *metaphysics* is "before physics."[20]

[18] Logical and necessary consequences of categorical relationships; truth derived by definition

[19] It is in awareness of self-evident axioms (common sense statements assumed to be true by their necessity, like *I am*) and tautologies (statements that are inherently true, like "to *be* is to exist"), and in the application of logical principles (rules that adhere to patterns of inference and Reason) to our observations of the facts of Nature, that physics as a field of inquiry able to inform mechanics comes about.

[20] Perhaps better understood, though, categories are contingent upon the physical world, the two being mutually dependent on one another. Categories have content and content has categories.

For the sake of this section, we are interested in the metaphysics of *cosmogenesis*, or how the Universe came to be, as known through self-evident axioms and rational abductions and deductions.[21] This will be considered by way of correspondence and coherence with the rest of what we know about the world.[22]

We know that the Universe is eternal, for instance, not because we can sense it or because we experience it— we've not been here forever to know!—, but because any other axiom or category cannot provide rational and self-consistent explanations; and because we can derive this conclusion by abductively treating known sense experiences after they occur. That the Universe is eternal is the only conclusion reachable by corresponding or cohering information. Nothing else matches.

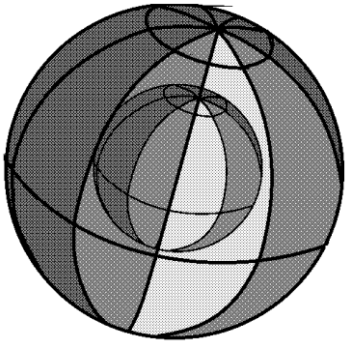
Parmenides of Elea, an Ancient Greek philosopher, declared long ago that "[n]othing comes from nothing." Parmenides never experienced *everything*—all that exists— in order to make a judgement like that through pure observation and induction therefrom. It wasn't a "scientific" claim on the level of observation, but a philosophical one, a logical or metaphysical one, a rational product of Reason. He didn't witness it, he reasoned it. This was metaphysics in action. Parmenides deduced this tautology as a matter of categorization, logic, and identity of concepts, saying "[w]hatever is, *is*, and what is not, *cannot be*." This is *tautological*, inherently true. Nothing is different from something, so nothing cannot be something,[23] cannot become something. Something *is*, and nothing *is not*. Plain and simple. Nothing comes from nothing, by definition. Things must come from something else. This is true independent of observation, though it can be confirmed by it, or at least is not contradicted by it. We can only know if this holds inductively at the end of the Universe, or after some sharp break from present reality.

In today's physics, we are coming to find more and more that Parmenides was correct in his fundamental assertions. Parmenides's deduction would later be developed into the *First Law of Thermodynamics*, otherwise called the *law of conservation*. This law says that all of the matter and energy that exists right now is all that ever has or will exist.[24] This is an example of metaphysics informing the hypotheses of science, and coming out on top. Before there is science, after all, there is the philosophy of science, the metaphysical considerations of the physical world. Parmenides's metaphysics translated into a law of physics upon enough failed attempts to prove them wrong. His philosophy became scientific theory. Indeed, the correct model of time, according to many theoretical physicists, is the *B*-model of time, as proposed by John McTaggart. The *B-model* of time treats past, present, and future as always currently existing, though not readily available, similar to Parmenides.

One of the most pressing pursuits of metaphysics is to understand *cosmological* questions, such as the nature of our Universe and its origins. These are the kinds of questions Parmenides and his fellow Greeks were asking millennia ago when they resolved that the Universe is a self-sufficient whole. For Parmenides and many to come after him, this was the *Monad*, an eternal, unchanging *One*. Parmenides, in his doctrine of eternalism, suggested that the Universe, a sphere with nothing outside of itself, was always constant and forever unchanging, and that our recognition of change, and of time, is an illusion. The Universe, he suggested, is *eternal*, it never ceases to exist in any place in time or in space. We may

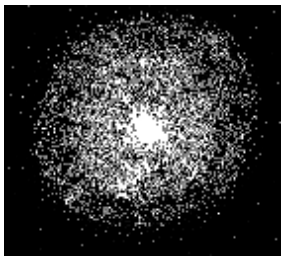
[21] *Abduction* is a best guest considering what is known, a likelihood or deduction without all of the facts. *Deduction* is inference made by logical necessity.
[22] Though the method itself will be implied rather than made explicit
[23] This would become known as the *Law of Identity* by way of Plato and Aristotle
[24] Some might suggest that this law is different from that of Parmenides, and has its home instead in Anaxagoras, another Greek philosopher. There are reasons for this to be the case. But time and again the solution of Parmenides has been returned to as a result of the implications of this law, such that Anaxagoras and Parmenides must not be entirely at odds.

think the past ceases to exist, and that the future is yet to be, but Parmenides refers to such an outlook as the world of *doxa*, or popular opinion. He does not believe it to be the fact. Recognition of an eternal and unchanging existence he refers to as recognition of the world of *aletheia*, or the world of fact. Parmenides's view of the Monad is similar to the *pantheism* that predates him as well (though other sages and philosophers would diverge on the details)— the view that God and the Universe are the same thing—, and can itself be considered a pantheistic perspective.[25]



2D depiction of a 3D shadow of a 4D hypersphere

Parmenides's Monad, the shape of eternity, might today be envisioned as a sort of *hypersphere*, a sphere that exists in at least four dimensions. In agreement with Parmenides, many modern physicists and astronomers suggest from observation that the Universe is not only spherical, but symmetrical.[26] The sphere has something like a point in the center of it.[27] Today we refer to this cosmological starting point as a *singularity*. This singularity is sub-eternal,[28] and has a fullness to it that the *pleroma*, or outer edge of the sphere, does not have.[29] The Pythagoreans symbolized it as a dot within a circle, and the neo-Platonists called this center the *Source*. Cosmologists still speak of the singularity in terms of a dot, which, depending on the orientation of the description, may sometimes be viewed at the center of an expanding Universe, a circle.



The pleroma extends infinitely outward, like an orb of light, until it nearly touches absolute nothingness, the void, which itself simply does not exist (as Parmenides said, nothing is *nothing*). This gives the three-dimensional world, unaware it is within a hypersphere, a *sense* of *infinitude* that is, ultimately, unfounded. Because of the lack of absolute nothingness, this sphere—like that of the Earth— has a quality that can be called— to use a term from people such as Stephen Hawking— *finite infinity* or *unboundedness*, the idea being that as one can traverse the surface of the Earth an infinite number of times (forever heading Westward, for instance) one can likewise traverse the boundary of the hypersphere an infinite number of times.[30] Regarding the *no boundary* concept, Hawking says, in *The Universe in a Nutshell*, that "[i]f all the histories of the universe in imaginary time are closed surfaces like that of the Earth, one would not have to specify boundary conditions at all." He says that "time and space are finite, forming a closed surface without boundary, just as the surface of the Earth is finite in size but has no boundary." You can walk around the Earth an infinite number of times, though it is finite, is the suggestion. Such a geometry as described can compose "a complete spacetime that represents the history of the entire universe," in

[25] Because the concept of the *Monad* is so important to the pantheists, whose role among the heretics—who compose a focus of this book— seems to be primary; because it was essential to the development of religion as can be observed in reality; and because of my own bias in this direction as informed by interdisciplinary study of works both ancient and modern; we will take the Monad to be axiomatic for the sake of this section, and will treat it as synonymous with the Universe.

[26] Also, the Universe appears *isotropic*, or uniform in all directions.

[27] If following after the Pythagorean and neo-Platonic philosophers, themselves followers of Pythagoras and the Graeco-Roman philosopher Plotinus; or even after our own modern cosmologies

[28] Meaning that it does not dissipate, though it is drifted away from. In other words, the singularity is always there, but we are not always in the singularity, because singularity is a location in or relation to spacetime. This is not the same with eternity, the true Absolute, which is always there and in which we always find ourselves, never dissipating.

[29] This may be compared to an *electron cloud*, which gets more concentrated toward the center.

[30] Or perhaps, claims Hawking, even experience an infinite expansion

which "the boundary conditions of the universe is that it has no boundary."[31, 32] Indeed, Giordano Bruno proposed something very similar some centuries earlier, for which he was burned at the stake as a heretic! Interesting how science catches up with philosophy over time.

As a whole, the hypersphere— the Monad— is unchanging, permanent, and undifferentiated, as a *static model*, the model popular before Big Bang theory (the idea that the Universe exploded into existence), might suggest. The hypersphere is a *superposition*—a position of all positions[33]— of *actual infinity*, the mathematical *set of all sets*, as worked out by the great mathematician, George Cantor. All of the possibilities that could exist, taken as a whole: *that* is the Universe. As matter appears solid to us, though being composed of particles on a smaller scale, some of which—electrons— are understood "to pop in and out of existence" within the electron field— the Universe on the scale of the fourth dimension likewise appears to be stagnant, despite the motion perceived in the third dimension, resulting from a flaw of limited perception. That's how it is a hypersolid, a sphere, despite all of the movement going on. It's a sphere in a similar way that a *cue ball*, like that used in the game billiards or pool, is a solid sphere even though its particles that compose it are in motion. While there is no way to prove the sphere through observation, it appears to be a necessary explanation for our existing in four dimensions in the way that we do, as well as for the symmetry that we see in the Universe.[34]

It is reasonable to think that our local, physical Universe does not have any more than four dimensions because we can sense those four dimensions as length, width, height, and the passing of time, but we cannot sense any dimensions higher or lower than these.[35] We sense emotions, which are difficult to place in three dimensions but can nonetheless be attributed to processes involving the fourth (in particular, to *syntropic*, or *retrocausal* processes, those that move backward in time[36]). In his paper, "The Dimensions of the Sensible Present," H.A.C. Dobbs likewise presents the view that— as described in Rudolf B. Rucker's book, *Geometry, Relativity, and the Fourth Dimension*— "concludes that our consciousness is four-dimensional, with three space dimensions and one dimension of 'imaginary time.'"[37, 38, 39] As Carl Sagan points out in *Cosmos*, working from the classic *Flatland: A Romance of Many Dimensions* by Edwin A. Abbot, a two-dimensional being would experience a three-dimensional

---

[31] Hawking[1], 84

[32] Hawking, as well as mathematicians such as Rudolf v.B. Rucker, tend to depict the Universe as traversing the outer surface of the hypersphere. However, to my view, this is incorrect, as the Universe as I understand it is projected outward from the center of the hypersphere. It is unbounded by maintaining itself as a monopole at the center.

[33] *Superposition* is a term used in quantum physics to describe a multiple presence of a singular object. You superposition, for instance, would include your current placement, plus the myriad of placements that can occur around you, as if you exist in all of those places at the same time. This is not something said to occur on the classical level of reality, but is suggested to occur on the level of the subatomic particle or wave.

[34] The fourth dimension, alongside the dimensions of length, width, and height, is time. Without time, nothing could move.

[35] Though it is common in the *postmodern era*— the era of regression from the Enlightenment— to propose that such is the case

[36] This will be explored later

[37] Rucker, 14

[38] While time is often treated in twos, as by Theodor Kaluza and the Kaluza-Klein model, which deals in five dimensions, it is a singular dimension, and the horizontal and vertical aspects of it actually represent action along the diagonal of spacetime.

[39] While the view of the Universe proposed does begin with rational *a priori* and something of what Henri Bergson refers to as a "mental auscultation" or "true empiricism," (Bergson, 37) of the intuition, wherein "one places oneself within an object in order to coincide with what is unique in it and consequently inexpressible," (Bergson, 23) such an inquiry is nonetheless within the realm of natural philosophy and natural mysticism. It provides a semi-magical account of Nature, wherein she is imbued with much life and mystery, and wherein anything is seemingly possible, but wherein all of the causes and occurrences are within, not without her. As such, what has been explicated is not a religious, but a philosophical and, where it can be had, scientific approach.

interruption as an internal, or at least highly-subjective experience, which would be unable to be proven to other two-dimensional beings. He then goes on to describe the fourth dimension.[40] Consider this along with what H.G. Wells said,[41] in *The Time Machine*, that "[t]here is no difference between time and any of the three dimensions of space except that our consciousness moves along it." Time is sufficient, then, to explain consciousness. Occam's razor suggests, then, that we might fruitfully stop looking elsewhere for explanations. By terms of Occam's Razor, and those of epistemological realism, then, we must limit the dimensions we address to these four.[42,43]

The Universe, according to the Hindus and the Aborigines, among others, contains within it something that may best be described as a *dream state* wherein its awareness is anchored in the sub-ultimate or mortal existence, like that of our own.[44] To the Hindu, this is the dream state of God, *Brahman*, the personification of the Universe. To the Aborigine, when one sleeps one inheres in, or exists within, *dreamtime*, the world of dreams, wherein the true reality is, and to which one returns when one dies, only to awaken in another stream of consciousness. Outside of this dream state— the imaginings of the Universe—, and in permanent wakefulness, suggests the Wisdom of Ages, is pure understanding and lack of concern: "blissful Being," "pure contentment," "nirvana."

Achieving contentment in our own lives is also possible, suggest the sages. The Ancient Greeks, like Aristotle, associated this with the ultimate virtue. In order to be virtuous, Aristotle advises us to seek *the Good* through Reason. The Chinese philosophers, such as Lao Tzu, called the path of virtue "*The Tao*." The Tao requires harmony, and attunement. Lao Tzu advises us, warning us not to seek too much and to follow the Tao, that

> Contenment is enough.
> Indeed, the bliss of eternity
> can be found in your contentment.

The Ancient Greeks and others in Europe and the Near East had various names for the contentment that can be found in one's own lifetime, often a result of some kind of virtuous union with the divine, or with the will of Nature. These terms ranged from *eudaemonia* to *gnosis* and *henosis*, among others. They mirrored their concept of a *sage*, one who has achieved Wisdom, upon what they expected to be

---

[40] See Sagan

[41] Long before Einstein's rendition of 4D spacetime, by the way.

[42] Much fuss is made in theoretical physics, such as in Superstring theories and M-theories and so on, about the potential of more fundamental dimensions, giving rise to all kinds of proposed quantum weirdness. However, until the model is reevaluated with consideration toward retrocausality, it seems reasonable to conclude that most of the quantum weirdness is just explanation for the apparent indeterminisms that phenomenally result from retrocausality. While retrocauality is not immediately discoverable by way of the senses, its edge over the other approaches requiring higher dimensions is that it orients phenomena within the four dimensions, it is self-evident, and it is found at the very basis of biological thought, as can be found in the work of Aristotle, perhaps the first serious biologist on record.

Free will indeterminacy, randomness, etc. are all just descriptions of human inability to calculate physical causation. As a specific, humanity is unable to fully comprehend the general. Our inability to calculate consequences to their fullest extent relies on space, or room within the general for the specifics to play. Free will is rooted in the room that future possibility creates. When one is confined, restricted in their motion, they are unable to cause change to their surroundings. They lack in free will.

[43] We could, perhaps, count psychological dimensions, such as love and hatred, but these are arguably related to coordinates in spacetime and to "forces" more on the level of the Four Fundamental Forces of physics than to dimensions, such as the four dimensions those forces operate within. Perhaps these psychological "dimensions" are the physical forces and dimensions experienced retrocausally.

[44] This is a phenomenal explication of something that is not, in any way, phenomenal or even noumenal, and which does not occur with any duration of time or any change at all. It simply Is.

behavior befitting of the One, a calm entity that is unmoved by external forces (Epicurus put forward a secularized version, popular among materialists; *ataraxia*). The Universe, solitary in its existence as a whole, has nothing to be aware of from outside of itself. Nor is time a factor at all for it except perhaps in its imagination, which— if the sages of the ages are correct— it experiences in its sleep (which may also be considered manic-depression), in contrast to its wakeful bliss.[45] The Universe is perfect contentment.

The *mortal* Universe, as understood through a *presentist*[46] lens, like that of our mortal lives, is already part of the makeup of the hypersphere— as seen through an immortal and *eternalist*[47] lens—, and virtually indistinguishable from it, as a ball is indistinguishable from the space in which it inheres.[48] So nothing is actually being created in what we call[49] *Creation*.[50] Nonetheless, we are accustomed to Creation myths, owing to our present awareness being anchored in (but not being identical to) this eternal presence.[51] Quite often these myths involve concepts such as *Creation ex nihilo*, or "Creation from nothing," in contradiction with Parmenides's notion that nothing comes from nothing, and so in contradiction with the First Law of Thermodynamics, upon which rests physics. Indeed, the medieval pantheist Eriugena, perhaps following the older thought found in Persian Mazdaism and Zoroastrianism, presented his own myth in such a way, before concluding that, in the end, Being wins over nonbeing, essentially nullifying the fact of nonbeing, and reaching some agreement with Parmenides. Nonbeing is the stuff of myth, and myth requires this notion. Mortality is something of a myth, too,[52] and likewise seems to require the notion of nonbeing.

A myriad of mythological systems have been constructed, each touching on some aspect of the nature of Being and its relation to nonbeing, but all of them disagreeing on the details. To begin with, they do not even share the same cast of characters— or "gods"— or even agree on the details as to what they did when they do make guest appearances in one another's stories. Still, as the perennialist outlook would

---

[45] Experience is an illusion requiring change, however, which we might expect that the *Absolute*—that to which nothing formally compares— does not undergo (at least not in any sense restricted by time). It may be rational to consider that the Monad may not experience change at all from wakefulness to sleep, nor any change at all (as the Monad is Ultimate and Absolute, while our world is commensurate—used here in the rare sense— as a noun— of something that is limited or non-fundamental— and relative). The Monad, in such a case, merely contains change within it while it "experiences"—or, rather, *is*— eternal bliss, owing to its own fullness and completeness.* This is so, suggests the wisdom of the ages, by the necessity of its Being.**

> *When you sleep, you awaken to the outside world. Awakening to the outside world lets you know that you are indeed awake. The Universe has no outside world. So, when it comes into a wakened state, it appears to be uninterrupted wakefulness, giving rise to its permanent wakefulness on the level of the Ultimate.
>
> **Thinkers of modern times, associated with the Wisdom tradition— such as Robert Thurman, Ken Wilber, Joseph Campbell, and Eckhart Tolle— have sought a state of bliss even in mortal life by being mindful of their being. "I am" is a popular statement of awareness of being, and "follow your bliss" an encouragement to act out of this understanding.

[46] A perspective which sees the present as the only reality

[47] *Eternalist* means "believing the Universe to be eternal."

[48] Has necessary existence

[49] According to our more *phenomenal*, or sensory, experience

[50] That is, except as an illusion connected to our mortal perspective within the immortal Monad, the Universe: we have a phenomenal experience of living in a Universe that was created, despite its every moment always having been here. All the "stuff" is always there. In containing our perspective, the mortal experience is already there, too, undifferentiated from the substance of Totality.

[51] The best of the myths can be found in the *perennial philosophy*, philosophy as it appears time and time again; or in the *Wisdom traditions*, traditions maintaining ancient wisdom; and in the anthropology of religion more generally; as derived from the poets, sages, and philosophers of the very distant past, as well as from the shamans of simpler peoples.

[52] See Spinoza[1]

tell us, there is something to each of them, even if each is not of equal worth. Nonetheless, and while there may be anthropological value in studying such matters, it is probably best to take a generally agnostic approach to such matters as have not been inferred or revealed with some certainty. Allow Robert G. Ingersoll's "The Gods" to shine some light on the absurdity of it all:

> Each nation has created a god, and the god has always resembled his creators. He hated and loved what they hated and loved, and he was invariably found on the side of those in power. Each god was intensely patriotic, and detested all nations but his own. All these gods demanded praise, flattery, worship. Most of them were pleased with sacrifice, and the smell of innocent blood has ever been considered a divine perfume. All these gods have insisted upon having a vast number of priests, and the priests have always insisted upon being supported by the people, and the principal business of these priests has been to boast about their god, and to insist that he could easily vanquish all the other gods put together.
>
> [...]
>
> These gods have been manufactured after numberless models, and according to the most grotesque fashions. Some have a thousand arms, some a hundred heads, some are adorned with necklaces of living snakes, some are armed with clubs, some with sword and shield, some with bucklers, and some have wings as a cherub; some were invisible, some would show themselves entire, and some would only show their backs; some were jealous, some were foolish, some turned themselves into men, some into swans, some into bulls, some into doves, and some into Holy Ghosts, and made love to the beautiful daughters of men. Some were married—all ought to have been—and some were considered as old bachelors from all eternity. Some had children, and the children were turned into gods and worshiped as their fathers had been. Most of these gods were revengeful, savage, lustful, and ignorant.
>
> [...]
>
> Our ancestors not only had their god-factories, but they made devils as well. These devils were generally disgraced and fallen gods. Some had headed unsuccessful revolts; some had been caught sweetly reclining in the shadowy folds of some fleecy cloud, kissing the wife of the god of gods. These devils generally sympathized with man.
>
> [...]
>
> To me, it seems easy to account for these ideas concerning gods and devils. They are a perfectly natural production. Man has created them all, and under the same circumstances would create them again [...] Generally he has modeled them after himself, and has given them hands, heads, feet, eyes, ears, and organs of speech. Each nation, made its gods and devils speak its language not only, but put in their mouths the same mistakes in history, geography, astronomy, and in all matters of fact, generally made by the people. No god was ever in advance of the nation that created him. The negroes represented their deities with black skins and curly hair. The Mongolian gave to his a yellow complexion and dark almond-shaped eyes. The Jews were not allowed to paint theirs, or we should have seen Jehovah with a full beard, an oval face, and an aquiline nose. Zeus was a perfect Greek, and Jove looked as though a member of the Roman senate. The gods of Egypt had the patient face and placid look of the loving people who made them. The gods of northern countries were represented warmly clad in robes of fur; those of the tropics were naked. The gods of India were often mounted upon elephants; those of some islanders were great swimmers, and the deities of the Arctic zone were passionately fond of whale's blubber. Nearly all people have carved or painted representations of their gods, and

> these representations were, by the lower classes, generally treated as the real gods, and to these images and idols they addressed prayers and offered sacrifice.
>
> [...]
>
> If a god created the universe, then, there must have been a time when he commenced to create. Back of that time there must have been an eternity, during which there had existed nothing—absolutely nothing—except this supposed god. According to this theory, this god spent an eternity, so to speak, in an infinite vacuum, and in perfect idleness.
>
> Admitting that a god did create the universe, the question then arises, of what did he create it? It certainly was not made of nothing. Nothing, considered in the light of a raw material, is a most decided failure. It follows, then, that the god must have made the universe out of himself, he being the only existence. The universe is material, and if it was made of god, the god must have been material. With this very thought in his mind, Anaximander of Miletus said: "Creation is the decomposition of the infinite."
>
> [...]
>
> The idea of a creative deity is gradually being abandoned, and nearly all truly scientific minds admit that matter must have existed from eternity. It is indestructible, and the indestructible cannot be created. It is the crowning glory of our century to have demonstrated the indestructibility and the eternal persistence of force. Neither matter nor force can be increased nor diminished. Force cannot exist apart from matter. Matter exists only in connection with force, and consequently, a force apart from matter, and superior to nature, is a demonstrated impossibility.
>
> Force, then, must have also existed from eternity, and could not have been created. Matter in its countless forms, from dead earth to the eyes of those we love, and force, in all its manifestations, from simple motion to the grandest thought, deny creation and defy control.
>
> [...]
>
> A deity outside of nature exists in nothing, and is nothing. Nature embraces with infinite arms all matter and all force. That which is beyond her grasp is destitute of both, and can hardly be worth the worship and adoration even of a man.
>
> There is but one way to demonstrate the existence of a power independent of and superior to nature, and that is by breaking, if only for one moment, the continuity of cause and effect Pluck from the endless chain of existence one little link; stop for one instant the grand procession, and you have shown beyond all contradiction that nature has a master. Change the fact, just for one second, that matter attracts matter, and a god appears.[53]

As Ingersoll makes clear, *deities*, or "gods," result from the lack of understanding of natural phenomena, and projecting thereupon with wild guesses or analogies. They are imaginary (though they are oftentimes analogical or metaphorical, or even abductive) tales used to explain natural phenomena in absence of the particulars needed to actually draw sound and cogent, or even congruent, conclusions. Instead, they have some subjective value, pertaining to the emotions they would evoke, as was defended by people like Carl Jung and his concept of *archetypes*, or categorical imaginings. This subjective value would be used to impart the emotions that the priests needed their subjects to feel in order to be obedient. However, this only worked because of the innate human need to understand, a feeling that

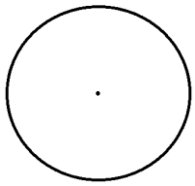
[53] Ingersoll[1]

exists even to this day. Myths answered questions about where we came from, who we are, and where we are going, even if incompletely, mistakenly, or as a flat out lie, and provided inspiration. We deemed this to be good insofar as we accepted the information and it appealed to our understanding and motivated us to do good. However, we also had many questions, and this is what gave rise to philosophy. Within philosophy, there does continue a strand of natural theology that adheres to a more teleological view than Ingersoll would find acceptable. And many great philosophers have been rational mystics, who have themselves contributed to mythology, including the Pythagoreans and Platonists. While Ingersoll is correct about the First Law and about the gods as they have been rendered by the human imagination, providing an important grounding in reality, there are nonetheless myths and theologies which stand as a little more rational, and that treat questions left unaddressed by Ingersoll.

Despite the agnosticism to which it may be best to submit our reason, and due to the inherent demand for such a thing, we might nonetheless entertain for a moment further a rational myth of our own, knowing full well that this is not the truth of the matter. We do this so that we may hint at the truth, despite our inability to grasp it and relativize it for the comprehension of others. The mystics of old have long held that the Absolute is indescribable; to describe the Absolute would be to put it in relative terms, terms within the context of, or in relation to, something else, which is automatically untrue of the Universe, which exists only within itself and only in relation to itself. We engage in myths not because we can successfully put the Absolute into relative terms, but because relative terms might hint at, or point us toward, a subjective conception of the Absolute. That myth may successfully do this does not mean that the myth, which depends on the concept of *nothingness*, is factually correct, though it may be helpful in providing an allegorical understanding of the condition of existence. Please don't let the power of a myth lead you astray, nothing still comes from nothing (and there is no change without the passage of time).

We might imagine, in beginning our myth, that, in its slumber,[54] the eternal Universe imagines itself within itself— becomes a thing within itself—, orienting its consciousness within the pure potential of a point.[55] Michael S. Schneider, in *A Beginner's Guide to Constructing the Universe: The Mathematical Archetypes of Nature, Art, and Science*, and following like Pythagoras and Plato in the tradition of rationalism and geometric idealism, gives us an axiomatic reason to start here. He says,

> Creating one central point from which to radiate a circle is the beginning of all geometric construction, no matter how complex it becomes. The steps involved in any construction are a metaphor for the stages of the divine, ongoing creating process itself. Anywhere you place a center you can scribe a circle and symbolically create the space of the universe itself.[56]



Schneider is not alone in starting here. He, in fact, gets this notion from the ancient Pythagorean philosophy and perhaps surrounding traditions.

Continuing with our myth, the Absolute and Ultimate One, in its slumber, enters the point, the role of the sub-ultimate, the sub-absolute, the Relative.[57] But it is still the One, self-reflecting. In this form, the

[54] Wherein the awareness of the Universe is anchored in the sub-ultimate.
[55] Indeed, this is mythology of *the One* as suggested by some neo-Pythagoreans, the *Source* say the neo-Platonists.
[56] Schneider, 7
[57] There is a difference between *Relative* and *relative*, the difference being that the Relative is absolute to other relatives, but not to the Absolute.

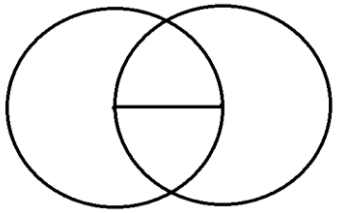
One is a *singularity*,[58] a point without space or time, suggests both the sages of old and modern physics. The singularity— the totality in uniformity— is mathematical or dimensional *zero*, relative *Nothingness*,[59] resulting from the combination of positive and negative existence.[60] It has no presence in space and time, has no dimension. The Nothing (which is actually something as a part of the Universe) is the place from which Creation *ex nihilo* occurs.

While the singularity— the unity of the totality— is Nothing,[61] the pleroma is *Infinitude*.[62, 63]

What arises between the Nothing and Infinitude— resulting from their contradiction— is the Few and the Many, the *multiplicity*, totality in its corruption. From the One, and in self-projecting, extending— extruding— itself within Itself, it becomes Two, becomes Three, Four, and Five. This gives us our four dimensions, requiring at least five points. To achieve these points, the original point becomes a line, becomes a plane, becomes a solid, becomes a hypersolid, or— as experienced in 3D or from the Four, and as we have learned— a solid *in motion*:[64] hypershapes may be experienced as motion in fewer dimensions, and must in order to bear witness to their parts.

The Few begins with the Two. The Two is the Nothing— the singularity— extended. It is composed of two points, giving rise to the First Dimension, a line. Michael Schneider rhetorically asks, "How can the Monad generate the other principles, other shapes, other numbers?" He answers,

> With a mirror. It simply needs another circle identical to itself. The circle replicates a mate for itself by contemplating itself, reflecting its light, and casting its own shadow.
>
> The process is mirrored in geometry as the birth of the line. It has been done from time immemorial through an ancient geometric construction called in Western traditions the *vesica pisces*



[58] The Source, or singularity, is the position from which the material-physical world manifests, and to which it will return.
Physicists today— to the extent that they are not neo-Sophists; that is, tricksters— are carrying on in the tradition of rational inquiry established in Greek philosophy. They're using concepts such as geometric necessity, eternalism, monism, emanationism, evolution, and etc. that can readily be understood as developments from the Greeks. These kinds of ideas— about a transdimensional Monad that contains in it a point or singularity, from which everything is Sourced— originate in ancient, perhaps even primitive, times, most likely in Ancient Egypt and Ancient Greece or among the early Celts, being shared through philosophers such as Parmenides, Pythagoras, Plato, Aristotle, Plotinus, and the Druids and Gnostics, down to the present day, perhaps as coming to us from as far back as the Late Stone Age, before we used copper or bronze.
[59] Absolute Nothingness does not exist
[60] 1 plus -1 equals 0. But the singularity is not zero as in it does not contain anything, so much as it contains everything, both positive and negative, and so is complete, as is 1. Positive and negative are relativistic, not Absolute. The zero of singularity is one of attributes, or differentiation. The singularity lacks attributes and differentiation.
[61] Allowing for myths of *creation ex nihilo* or—the atheist version, and book by Lawrence Krauss— *A Universe from Nothing*.
[62] This is, of course, not an absolute nothing and infinitude, but a Relative nothing and infinitude, relative only to the Universe, the Absolute, as sub-absolute.
[63] As Manly P. Hall popularly reflects, "The fall of man is the descent of the ladder from the dot to the circumference; the resurrection or redemption of man is his return from the circumference to the dot."
[64] A *pentagram*, the five-pointed star, is a symbol of four dimensions, while a *merkabah*, the six-pointed star, is a symbol of five dimensions. In the process of generating the dimensions according to geometric myth, each step requires an extrusion of the step before it. A point is extruded to become a line, a line to become a plane, a plane to become a solid, etc. If life is the stuff of the fourth dimension, an attempt to transcend the fourth dimension might include an attempt to extrude living things. What might this attempt look like? Could it be the formation of civic institutions? Does it require extraction of wealth from unwilling participants? Can it be done voluntarily?

> [...]
>
> As if across a mirror, the archetypcal line is drawn between the two centers.[65]

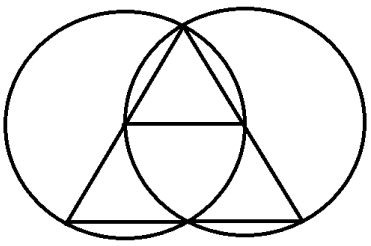
Indeed, the *vesica pisces*, which produces a fish symbol, like that used among Christians, is a well-founded tool in mysticism, from which the *seed of life* and the *flower of life*— two other "sacred geometry" patterns— are derived. In some religious traditions, such as neo-Platonism and Gnosticism, this Dyad, here created by the *vesica pisces*,[66] may be understood to be the *Demiurge*, a lesser deity than the One or the Monad. Michael Schneider, too, tells us that

> The principle of "twoness," or "otherness," was called Dyad by the Greek philosophers [...] They were suspicious of it because it seemed to revolt from unity, distancing itself from the divine Monad. They referred to the Dyad as "audacity" for its boldness in implying a separation from the original wholeness and "anguish" due to its inevitable yearning to return to unity. It was also called "distress," "falling short," "the lie," and "illusion" since they believed the Monad alone was all.
>
> [...]
>
> The principle of the Dyad is polarity. Polar tension occurs in all natural and human affairs as any opposing relationship, contrast, difference. It is at the root of our pernicious notion of separateness from each other, from nature, and from our own inherent divinity.
>
> The paradox of the Dyad is that while it appears to separate from unity, its opposite poles remember their source and attract each other in an attempt to merge and return to that state of unity. The Dyad simultaneously divides and unites, repels and attracts, separates from unity and craves a return to it.[67]

Without the Two, necessary for division, polarity, and duality, there would be no potential for the subject/object split, of *I* or *Me* and *It*. As they say, "[i]t takes two to tango." Relativity and subjectivity, as experienced as separate beings in the world, depends upon a disunity of experience, an opposition. This opposition has been very important for the thought of alchemists, such as Giordano Bruno (who concerned himself with the "unity of opposites") as well as for later philosophers, such as Georg Hegel (who believed that history, which he held is moving toward the Absolute, is a dialectical process whereby subject and object are ultimately resolved). As One, all perspective is absolute, there is no relative experience. The object and subject split only when One becomes Two or more.[68]

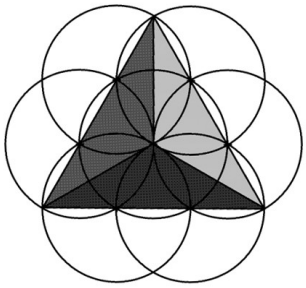
Next comes the Three. The Three is composed of three points, giving rise to the Second Dimension, a plane. John Yarker, in *The Arcane Schools*, tells us that

> an example of the Masonic manner in which these may be made to convey instruction may be illustrated by the equilateral triangle. It has three points; a point has position only; a line has length only and terminates in two points; three lines of equal length at equal angles form an equilateral triangle, or the primary figure in geometry, and represents the trinity in unity, or Deity pervading all space, creator of all things animate and inanimate; doubled it represents the perfect godhead, and the male and female energies of nature. Or again, a "point" is the beginning of any active duty,

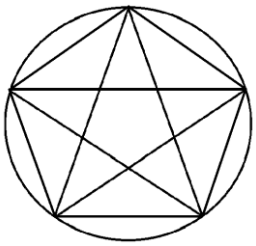


[65] Schneider, 22
[66] This shape is also used to construct the *Flower of Life* shape that so emblemizes what is called *sacred geometry*
[67] Schneider, 24
[68] Magnetism and other aspects of the Universe are also dependent upon duality or polarity

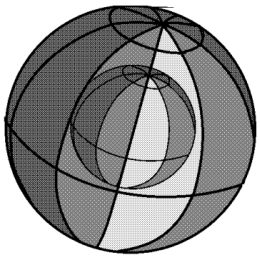
the flowing of which point generates a "line;" a line is therefore either reward, duty, pleasure, or profit. A "right line" is a duty performed and pursued with constancy. The extension of a right line to generate a "surface" is therefore perfect duty.



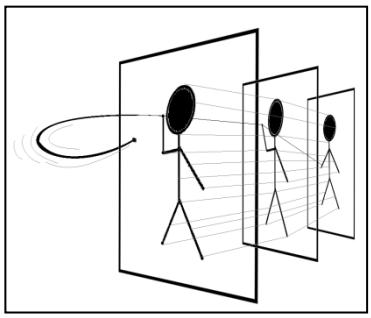
Then comes the Four. The Four is composed of four points, giving rise to the Third Dimension, a solid in the form of the tetrahedron, which Buckminster Fuller and others have understood to be the most basic shape of 3D space. The Five is after that.



The Five is composed of five points, giving rise to the Fourth Dimension, the spacetime hypersphere, the Universe. The Greeks, suggests Michael Schneider, referred to the Five, in the form of the five-pointed star, or *pentacle*, as *Pan*, which means "all."[69,70] Within the four dimensions, contained by the five fundamental points, is *pan*, everything that physically exists throught time. This One Everything was worshipped as God by *pantheists*—those who believe Nature, the Universe, Reality, or something similar to be God—, who have come to give it all kinds of names, often relating to the nature of Being or Reality, as in *Yahweh*, *Brahman*, *Ahurda Mazda,* or etc., each ultimately a reference to the totality of existence, the Ground of Being, the state of Being, the Source, or etc. For many pantheists— including Christian pantheists,[71] but especially neo-pagans—, the pentacle is an important spiritual symbol.



The One gave rise to all other numbers,[72] which manifest within the four dimensions. This might take place, if we are to continue in our myth-making, by the singularity stepping into the mortal Universe[73] and manifesting as a single meta-particle, itself extending back-and-forth through frames of time, not unlike the self-extension of the point that gave rise to the dimensions. From this single meta-particle is derived the Many.



Imagine window panes lined up one behind the other, with dots on each pane. The panes are frames of time, and the dots are particles moving in time; each pane has the same particles represented on it, but repositioned, to represent motion. The dots create a picture. Now, imagine those dots on the panes, that are creating the picture, as being created by the figmentation-filamentation of a single meta-particle; that traversing through time allows the meta-particle to appear on each pane more than once.[74] It goes through one pane and then another, leaving its mark as it goes. It does this back-and-forth. In this way, every particle is

[69] Schneider, 100

[70] Schneider carries on to Ten, "the Decad," in his book, but if there are more than four dimensions, to which his work applies, these are likely dimensions perceived as "internal," such as emotions and so on, and are not a part of spacetime itself.

[71] The Apostle Paul said this, in *Acts* 17:28, of God, providing a pantheistic definition: "For in him we live, and move, and have our being; as certain also of your own poets have said, For we are also his offspring."

[72] 1x1=**1**, 11x11=1**2**1, 111x111=12**3**21, etc.

[73] Similar to the Absolute stepping into the sub-absolute.

[74] As a *wavicle*—appearing as either a particle or a wave, or both— such as an electron is understood to do in its *quantum leaps*.

composed of the single *worldline*—the history seen as a line— of a single meta-particle.[75] That is, when the panes are set in a series, such that one looks through the many panes at once, the picture is of a *timeworm* or *worldline*, all of the motions taken throughout time, seen at once (kind of like superposition, but with time instead of space). As the meta-particle, in clustering, forms many particles (by appearing in each time-frame more than once), the many particles form many atoms (atoms have multiple of the same kind of particle), which form many molecules (a molecule is made up of multiple of the same type of atom), which form many macromolecules (a macromolecule has multiple of the same kind of micromolecule), and so on.[76] Our own lives are similar, in that our lives weave together to form an even larger entity, that of society. The Universe, in such a case, is a self-composed one-line drawing and the Laws of the Universe, and its conditions, are something of the dynamics or elements in the story being told.

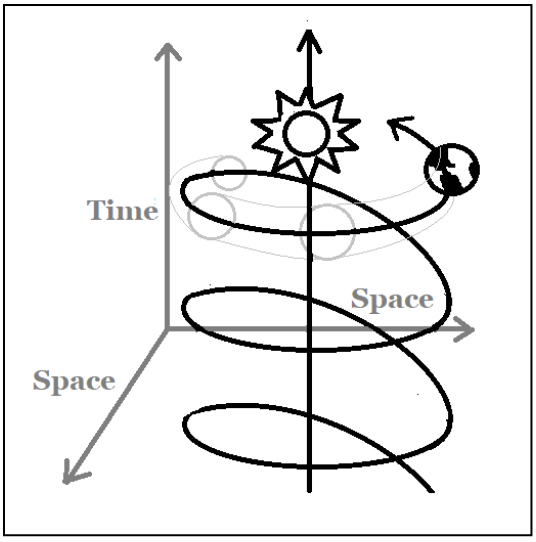
While we have imparted this as a myth, it is not entirely outside of discussion surrounding theoretical physics. Indeed, the physicist John Wheeler famously proposed the idea that a single particle could be manifesting as many, his *one-electron Universe* idea, to Richard Feynman, another physicist who acknowledged this idea in his Nobel Prize speech (saying that he stole another component from Wheeler of what was said on the phone, the idea that electrons and positrons existed on the same worldline, moving in different directions[77]). Taken frame by frame, and according to the senses, this one particle's *worldline*—timeline of existence— could appear to be a particle or wave, a *wavicle*, as named by Arthur Eddington, perhaps having some elements of a *virtual particle*. When viewed from a sufficient size, the worldline might appear as many worldlines, giving rise to our world of interacting timelines.[78]

[75] Creation within the dimensions, to reiterate, may have been effected by— like the Monad stepping into singularity— singularity stepping into multiplicity. It may have done so as a single three-dimensional wavicle that passes through all frames of perspective—each frame of perspective containing a moment of moments—, thereby tracing a single superpositive worldline to which all other worldliness and superpositions may be reduced.

[76] This allows for the patterning of the meta-particle within a larger frame-set, knowable only by direct access to the whole of the fourth dimension. That is, the set of all frames (itself a frame when viewed zoomed out) conceives a pattern— from the passing of the single particle between the multiple frames— from a single perspective.

[77] This idea is most likely sourced in Paul Dirac's original conjectures involving anti-matter, which posed that the opposite spin and charge of anti-matter suggested different orientations in time.

[78] One might visualize worldlines within the Monad as the filaments within a *plasma globe*, the popular glass balls that one finds in novelty shops that look like they have lightning inside (that if one touches reacts), and the Monad as the set of all of the possible configurations that could ever occur within the globe, taking place at the same time. The light filaments are the worldliness, which can be imagined as the life of all of the matter and energy that composes a line of time. The globe is the Monad. However, while such a visualization is useful, taking it too literally can lead to problems, because the globe exists in something else while the Universe exists in itself, and because the worldlines are so complex as to exist for every single particle in existence, such that an individual's worldline is more like a long knot, the coming together and apart of the particles and energy that compose the individual's existence.



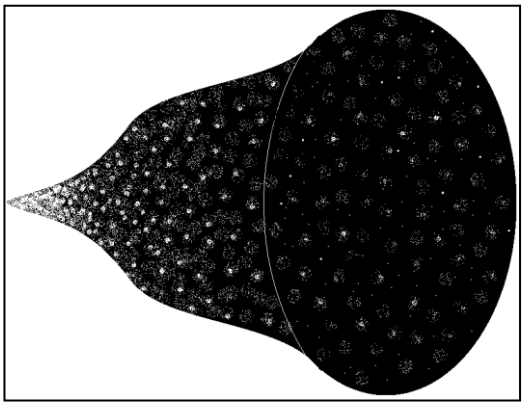
Worldline of the Earth orbiting the timeline of the Sun
(shown in one dimension of time and two of space)

Having designed itself perfectly—or, rather, not at all, but having pretended, perhaps—, and complete with all of the particles, atoms, molecules, cells, and creatures and their societies, with all of the laws of physics, chemistry, biology, and sociology established to tell the many stories within— keeping the story together—, it is now time for the Universe to step into itself once more, but this time not as a single particle scribbling a one-line drawing. This time, it's time to play around. From the Five it steps directly into the three-dimensional figures it has created, into each of the lives of the sentient creatures it has shaped, dividing its awareness among them in a plural fashion and dispersed throughout different events in spacetime,[79] providing each with a waking state containing a generally uninterrupted stream of consciousness, and animating them with motion in their 3D world from the Fourth Dimension. It is in this respect that every sentient organism is an avatar of the One, the *World Soul*, which provides each and every individual with their awareness, their individual "soul," guiding them back to their Source.[80] This awareness, *Sophia*, now entrapped (according to plan) by the Demiurge, becomes divided as it goes from four to three dimensions, first into two, and then into a plentitude of souls. In this division and separation, relativity and subjectivity appear.

This worldview, while stated in a particular fashion for you here, is similar to that of the sages of old. Capacity for such an understanding is an intrinsic part of being a modern human being, as *Homo sapiens* is defined by *sapience*, or "Wisdom," sometimes called, after the sages, *sagacity*. *Sapience*, or *sagacity*, often associated with Sophia, is the capacity to grasp the ultimate Truth. What I have told you, you probably already knew, as Plato held that the Truth is already within us. I, as a philosopher, merely have the honor of helping you to remember.[81] But what will you do with that memory?

[79] It can do this because it is in 4D and the world is in 3D. Think of how you could pass multiple fingers through a plane of vision, such that one could see the fingers disconnected from the hand. Or perhaps consider the many eyes of a spider, looking through a number of peep holes to different places. Neither of these are perfect examples, but they help to allude to the unspeakable concept that is being employed.
[80] The Universe is a *monopole*, a polarity with one pole
[81] Others who present this information may differ on the specifics, but the general idea, that there is a united whole of Nature, of which we are a necessary and corollary expression, and that there is no such thing as free will, but that enlightenment can nonetheless improve our lives and make us better people, is a common thread running from the Radical Reformation and into the Radical Enlightenment, which would give rise to Mutualism.

The Cosmos



Big Bang
(as commonly depicted with inflation, likely mistaken)

The *Big Bang*— put forward by people such as Georges Lemaitre and George Gamow, though anticipated by the heretic Giordano Bruno— is a theory in physics about the origins of the Universe. It suggests that all of the stuff in the Universe came from a single origin, wherefrom space and time also expanded.[82] The place from which expansion occurred— a place of pure potential— is typically called a *singularity*.[83] This was a point where all of the matter and energy in the present Universe, prior to the Big Bang, shared a single location, without space or time, having no dimension or characteristic. This was described as a "*cosmic atom*" by Lemaitre. All of the matter and energy in our Universe, by the contemporary Big Bang view, existed at this singular point as pure potential. Something occurred to set off the initial conditions of the balance of pure potential (perhaps better explained in theology than in physics; Lemaitre was a Jesuit priest), leading to an incredible explosion into existence. All of the potential was released and the stuff of the Universe came into being in one Big Bang. What it was that set the initial conditions of balance off is one of the greatest mysteries in physical cosmology.[84] But we know it happened because of the redshift. As Dinah L. Moche, in *Astronomy*, says,

> The basic observation that must be accounted for by any cosmological model is that light from distant galaxies is shifted in wavelength toward the red end (long wavelengths) of the spectrum. This phenomenon is called *cosmological redshift*.
>
> Modern theory says that this redshift [...] results from an expansion of our universe, so that other galaxies are racing away from us.[85]

It is only logical that an expansion must have an initial condition from which it is expanding, and that initial condition was a singularity.

The Big Bang view contrasts with the static Universe and the steady-state view. The static Universe was long-held to be the case, suggesting that the Universe is infinite and neither expands nor contracts, as put forward by Thomas Digges. The *steady-state* view of people such as Hermann Bondi, Thomas Gold, and Fred Hoyle, says that the Universe, despite its expansion, remains practically unchanged because there is a continual generation of matter within it to make up for the added space. The steady-state view holds that there was no Big Bang, but that the Universe is eternal.

---

[82] Lemaitre and Gamow were anticipated by people such as Empedocles and Giordano Bruno. Bruno had held, following Anaxagoras to a certain extent, that, in the beginning, everything had come from a single seed, wherein all had shared an identity as a single entity. Empedocles had held that a force called *Strife* had fragmented the world from its original unity, and that one called *Love* would put it back together.

[83] While popular, this term is contested on mathematical grounds

[84] There are some who contest that there are problems with the Big Bang theory, saying that the math or logic does not add up for various reasons, or that there was a prior existence before the singularity, suggesting that the Big Bang is incomplete. However, physicists are all too often material or physical reductionists, and see no role for things like mood in the Universe. A pantheist perspective, generally rooted in neutral monism rather than in physicalism-materialism, ascribes mental processes to the Universe, which would allow such things as a mood change to correlate with the change in the initial conditions. This view corresponds with the basis of the new field of socionomics, which suggests that major changes in society result from societal mood swings.

[85] Moche, 174

Other contenders to the Big Bang theory—and there are many— include plasma cosmology, as inspired and proposed by theorists such as Hannes Alfven, Anthony Peratt, and Winston H. Bostick (working off of people like Kristian Birkeland and Irving Langmuir), the electric universe, a related view of thinkers like David Talbott and Wallace Thornhill, as well as various related but deviating ideas from the Big Bang, such as the oscillating models of Neil Turok or Lee Smolin. Some electromagnetic explanations have been given for some of the processes associated with Big Bang or expansion cosmology (such as the Hubble expansion), too. Other views, such as that of Michael Talbot, propose the Universe as a holograph, and Amit Goswami maintains a perspective in quantum physics that he associates with *monistic idealism*, the idea that the Universe is all of a single mind. Concepts in *string theories* and *M-theory* propose that there are more dimensions than the classic four and that extradimensional planes, called *membranes*, and in which our Universe and others may inhere, may clash, potentially being responsible for the Big Bang. Neo-pythagoreans and neo-Platonists persist, as well, holding to more ancient conceptions of cosmology, sometimes attributed with the concept of the *harmony of the spheres*, that the Universe functions as one song, generally seeing importance in numerology— often involving seven as a focal point— and music.

There is, no doubt, much work to be done when it comes to the specifics. It is likely that a completely scientific cosmology is entirely beyond our mortal reach, and that natural philosophy serves to better guide our understanding. This is especially so when considering *retrocausal* or *teleological* aspects of the Universe, which imply agency from an invisible future from which we, as mortals trapped in the present, have no agency. This is suggested by our *psychological arrow of time*,[86] which tends to correspond with the *thermodynamic arrow of time*, which operates from the past to the present, whereas the *biological arrow of time* operates from the future to the present. This dynamic, wherein our awareness corresponds largely to entropic phenomena, ensures that *final causes* derived in the future remain untestable and ultimately unobservable to us from an inductive, *a posteriori* approach.

The Big Bang is, of course, and like the rest of them, a position taken from a presentist perspective, rather than an eternalist one. From the position of strict eternalism—seeing the Universe as eternally present and unchanging throughout time—, the answer is quite simple: there was no beginning to the Universe and there will be no end. It has always been here, just as it is, and will always be here the same way. However, the strict eternalist view seems to be about as practical for life as religion is. It's like the Zen koan that goes: "Before enlightenment, chop wood, carry water; after enlightenment, chop wood, carry water." Essentially, this koan implies that enlightenment of the sort described by mystics and metaphysicians appears not to have an outward effect at all, but only inner value, such as peace of mind or moral direction. If we take the common sense view that our mortal existence has some sort of realness to it, though, even if not in an ultimate sense, and that being alive has some kind of purpose to it, then we must see the value in rationally investigating the origins of our existence and that of the rest of the mortal Universe. That we may resolve ultimately that the collection of all of our actions compose an eternal, unchanging hypersolid should not detract from the common sense realness of those actions.

---

[86] For the sake of this work, this might be better called the *cognitive arrow of time*, as the arrow of *conscience*, the other half of our psychology, corresponds instead to syntropy. Even *entropic conscience*, the conscience which puts others above self or self above others, is ultimately rooted in syntropy, because love at the expense of others is still love, and love is syntropic, an act of preservation against entropy. It is merely a lower order of sentience, a lesser application of syntropy. A good way to remember this is to consider the *yin* and *yang* of the Taoist *taiji* symbol, a symbol of the One wherein its two aspects are tied together by some of each in the other, presented as a white dot on the black side, and a black dot on the white side. If we consider the white side to be mental, and so syntropic, and the black to be material, and so entropic, then we see that such things as entropic conscience as well as cognition, both mental phenomena relating to material-physical reality, are the black in the white. Despite *cognitive arrow of time* being a better label, the *psychological arrow of time* is the better-known, and the one that will be used for now *colloquially*, or in a casual sense.

Our mortal experience, and that of others, has an origin, and this origin can be logically traced, even if it arises from an aetherial or unchanging state, and even if ultimately an illusion (*maya*) of *Samsara* (in Eastern terms) or *doxa* (in the West), false perception. We want to do more than chop wood and carry water; we want to do so more efficiently.[87] Eternalism may well be true, but we need answers to our mortality, too, and eternalism doesn't provide those answers.

The steady-state theory, like many schools of philosophy both West and East,[88] was intended to reconcile eternalism with presentism. And indeed, eternalism and presentism need not conflict when one maintains a proper understanding of how they may relate. How might a Big Bang, which is clearly in motion and is an explanation of origin, relate to a stagnant, eternal Universe? The steady-state theory provides an unsatisfactory answer. But the Big Bang has too much evidence behind it to ignore.

The right answer comes down to relationships of scale or dimension. The solid matter of your sensory experience is understood in physics to be composed of atoms; and those, from particles that never actually, physically touch. The solid stuff, as seen from a classical scale, is, on a smaller scale, in motion. It's not solid at all, not stagnant, on that level. Similarly, seen from a four-dimensional (spacetime) perspective, all of the motion in the Universe is part of a solid "block,"[89] likely taking the form of a hypersphere.[90] But that hypersphere contains the entire history of the Universe in it, in motion, starting from the Big Bang, a premise rejected by steady-state theorists.

Many dynamics are at play in the formation of the Universe, including those of dimensions, scale, the fundamental forces, and the substances that make it up, among others. Matters of scale usually come down to conflicts between the large, medium, and small scales, treated separately by general relativity, classical mechanics, and quantum theory. The fundamental forces described by the standard model include gravity,[91] electromagnetism, and the strong and weak nuclear forces. The stuff that makes the Universe up is a topic of much contention, with some suggesting that the Universe is made of matter and governed by physics (materialism, physicalism), others of mind or spirit (idealism, religion). Some suggest that there is both matter and spirit, but that they are different substances. Still more, like the philosopher Spinoza and most *pantheists* (believers that all of existence is God), suggest that matter and spirit are merely attributes of an underlying, singular Substance, a position known as neutral monism or dialectical monism, as is expressed throughout this book. Indeed, even the four fundamental forces, says Brian Greene in *The Fabric of the Cosmos*, may form a "single fundamental force of nature that, through a series of cosmological phase transitions, has crystallized into the four seemingly different forces of which we are currently aware."[92] Everything is ultimately one.[93]

Theories of *relativity* are longstanding, and can be found pronounced in thinkers such as Archimedes, Galileo, and Isaac Newton in the form of *classical relativity*, which describe relativistic relationships in

---

[87] And even Thomas Reid, the philosopher of Common Sense Realism, leaves room for religiosity. But I'm not even asking for that; metaphysics need not be about religion, it can be good, solid, natural philosophy.

[88] But most commonly associated in the West with the efforts of the Greek philosopher Anaxagoras

[89] Called the *block Universe*

[90] Ancient philosophers— probably preceding even Parmenides of Elea or the Vedic philosophers— had long figured that the Universe is eternal (meaning that it is unchanging). Modern theoretical physicists often agree. What has happened is still happening and what will happen is already happening. This is understood as cosmological eternalism or the Block Universe theory. The Block Universe implies the contemporary notion in physics of the B-theory of time, as well as the lesser-known concept of syntropy. John McTaggart's B-theory suggests that time does not simply move from past to present in a linear fashion, but that all points in time exist simultaneously.

[91] It is becoming common not to describe gravity as a force, but mechanically as a result of acceleration

[92] Greene[1], 266

[93] And those four fundamental forces can be put into two main categories

terms of classical mechanics. However, concepts in relativity would become particularly important to modern and postmodern physics after a turn toward *general* and *special relativity*, beginning with the thought of people such as Henri Poincare, Oliver Heaviside, and Olinto De Pretto, as well as the classical mechanicists Ernst Mach and Friedrich Hasenohrl, and finally Albert Einstein, a patent clerk (whose father had worked with Olinto De Pretto). The relativistic equations describing relativity, depending on the variant, imply relationships between space and time, matter and energy, new descriptions of light and gravity, and etc. Einstein's version and its derivatives imply that space and time exist together as a single manifold that may be warped and bent by the presence of mass,[94] giving rise to gravity, and potentially allowing for time travel. Einstein's theory suggests that *duration*, the passing of time, is relative to one's frame of perspective.

Einstein came up against many of the classical mechanists, including Ernst Mach. Mach had been a forerunner of general relativity, according to Einstein himself, who had said, according to Abraham Pais, in *Subtle is the Lord: The Science and the Life of Albert Einstein*, that "[i]t is justified to consider Mach as the precursor of the General Theory of Relativity."[95] Mach had come from a classical mechanics background, dealing in aerodynamics, hydrodynamics, optics, and acoustics. A man of strict common sense, Mach did not believe in atoms or atomic theory because atoms could not be observed or measured. But he put forward an important principle for which he is the namesake, *Mach's principle*, which suggests that local physical conditions result from the conditions of the Universe at large, and that everything is relative to the Universe, which serves as the absolute standard that local motion may be contrasted against. At first, Mach may have been esteemed by Einstein's comment and to have been considered in such light. However, he would eventually come to disagree with the idea, saying "I [...] must assuredly disclaim to be a forerunner of the relativists."[96]

Mach's principle, despite Einstein's original endorsement, is often used to argue against Einstein's concepts of relativity. However, perhaps the most damning thing for Einstein comes from the inconsistency of his relativism when it comes to the "clock paradox." Einstein held that an observer at rest will move faster in time, while an observer in motion will move slower in time. But the problem comes when applying the notion of relativity, because without a standard to function as absolute there is no rest and motion; that is, observers at rest may appear to be in motion to an observer in motion, who may perceive themself to be at rest. Mach's principle seems necessary.

Another important criticism of Einstein is that his *constant*—the *c* in $E=mc^2$— appears to have been arbitrarily derived from Maxwell's equations. To this day, the speed of light can only be claimed to be measured by elites with access to equipment beyond the senses of the masses; the elite essentially depend on the trust of the masses that what the elites are saying is the truth and is not political theater.[97] All the while, many scientists have been overshadowed, downplayed, censored, deplatformed, and canceled due to their having politically incorrect outlooks on the world, being relegated to positions of "fringe science" with actual frauds and obvious kooks.[98]

---

[94] A common description of gravity by mainstream scientists is a sophism that involves describing gravity with gravity, as by suggesting that gravity of a planet operates similarly to a ball rolling on a blanket that has been suspended, pressing down as it moves along, distorting the contours of the blanket. This is similar to a hypothetical dictionary entry that defines a word with that word.

[95] See Pais, 283

[96] See Pais, 283

[97] This trust is being shaken more and more by recent events

[98] This is something that became especially institutionalized by the cultural Marxist *Long March through the Institutions*, whereby the post-Marxist ideology of the Frankfurt School had been administered by well-placed technocrats filling roles in private and governmental institutions such as colleges and universities. This was itself

Since Einstein's time, and especially in the quantum realm that went even further, science has been put into terms of *counter-intuitive* and "beyond common sense." Indeed, Brian Greene remarks that "[t]hroughout his life, Einstein challenged common sense."[99, 100] Thomas Reid, however, taught us that common sense must necessarily precede philosophy (which must in turn precede science, as the philosophy of science came before science as practiced), because without concrete observations about the world and a comprehension of them we have no foundation for discourse. Why would Einstein want to challenge common sense?

Einstein's general and special relativity became widely accepted by the academic elite, to the point of becoming *hegemony*, or the accepted norm. Still, this did not protect Einstein from having his ideas challenged altogether. In fact, Alexsandr Friedmann would show that Einstein was mistaken about his conception of the static Universe—a concept similar to the steady-state theory— and that the Universe was, indeed, capable of expansion or contraction according to the terms of Einstein's equations. But Einstein's equations would succeed in pushing classical mechanics[101] outside of the range of description of the most fundamental aspects of the Universe. Ultimately, relativity of Einstein's brand represents the first institutional step away from classical mechanics,[102] and toward the post-classical physics of the postmodern era[103] that would substitute relativity and subjectivity in for the absolute and objective truth, uncertainty for necessity.

Einstein would meet his match when it came to quantum mechanics, which he fiercely rejected at first, famously exclaiming that "God does not play dice!" in reference to the new quantum worldview, of people such as Niels Bohr, that the Universe worked according to the probability of particles rather than according to fixed laws of causality. In the end, Einstein had challenged classical mechanics with his relativity theory, but Bohr and his kindred had challenged Einstein's new paradigm with the newer quantum mechanics. Over time, a conflict of scales became rather pronounced. The macrocosm would become dominated by the mechanics of relativity and gravity, the microcosm by those of quantum and electromagnetism, and that in between would continue to be described in classical mechanical terms. Conflict between gravity and electromagnetism seemed to give rise to a persistent effort to unite them, as has been done with the electroweak force or in the Grand Unified Theory.

While quantum mechanics did not necessarily prove Einstein immediately wrong in the public mind, it did limit Einstein from having claim to a complete *Theory of Everything*, a theory describing the world at every scale, applicable at all times. Whereas Einstein's relativity worked to describe the physics of the macrocosm, which classical mechanics had not satisfactorily done, the new quantum mechanics described the physics of the microcosm, creating a chasm that, to this day, has not been fully resolved by any formidable consensus. Relativity and quantum mechanics, as they were presented by Einstein

---

the Western expression of the Maoist *cultural revolution*, discussed in more detail later, after more context has been presented. All-in-all, though, what would become the Long March through the Institutions was an elitist attack on common sense realism and popular rationalism, and a step away from true science.

[99] Greene[1], 45

[100] To challenge common sense is to challenge the stuff that made the Radical Enlightenment (discussed later in detail, but a social movement from which Mutualism came) what it was, most famously expounded in Thomas Paine's pamphlet, "Common Sense." *Common sense* means "sound, practical judgement concerning practical matters," says Wikipedia.

[101] A tradition coming from the *physikoi* of Ancient Greece, revived in the Renaissance of Medieval Europe, and having developed into the mechanistic philosophy of the Scientific Revolution, which would go on to inspire the Moderate Enlightenment

[102] Of Newton and others of the Moderate Scientific Revolution that were behind the Moderate Enlightenment and modernity, discussed later

[103] The era that followed the turn of the 20th century, especially kicking in after the World Wars (but also anticipating them), which we are still arguably living in

and especially Heisenberg, are, however, in agreement about the need to challenge common sense. As Stephen Hawking says, Heisenberg's "uncertainty principle signaled the end to [...] a model of the universe that would be completely deterministic: one certainly cannot predict future events exactly if one cannot even measure the present state of the universe precisely!" In this way, practical or applied science was complicated with useless banter and inassertion, instead of focusing confidently on results. Now, everything, at the most fundamental level of existence could be reduced to "randomness" or "uncertainty." Further, Hawking says, in (*The Illustrated*) *A Brief History of Time*, that it is better to "cut out all the features of the theory that cannot be observed."[104] This means that there is no room for teleology or retrocausality—rationalism— in the official picture! No common sense, no rationalism, two strikes in one blow. But with neither common sense nor rationality, what is even left? And what does observation even consist of, independent from common sense?[105]

To address the origin of particle physics and quantum theory, we have to back up a bit, because these ideas actually pre-dated Einstein and the popularization of his theories of relativity. Western particle physics, like that used in quantum theory, had found its home originally in Ancient Greece among people such as Anaxagoras and the later atomists or *physikoi* (physicists). It would continue to be considered throughout time, by people such as Giordano Bruno, Isaac Newton, and Leibniz. While there had been an interest in atomism since at least the time of the Greeks,[106] and magnetism since at least the time of the *Baghdad batteries*— ancient batteries made with clay pots and vinegar— and in the thought of Thales and Anaxagoras, Roger Boscovich is often attributed to being the major influence to lead in the direction of modern particle physics, electromagnetism, quantum mechanics, and quantum field theory.[107] A Jesuit philosopher, Roger Joseph Boscovich would synthesize the Leibnizian and Newtonian views with Kantian and Swedenborgian ones.[108] He would become an influence on such major thinkers as Lord Kelvin, Michael Faraday, James Clerk Maxwell, and many others, siring an intellectual lineage from J.J. Thomson, through Ernest Rutherford, to Niels Bohr, to name a few. Boscovich would also become a major influence on Friedrich Nietzsche and his concept of the *will to power*. Nietzche had contrasted the work of Boscovich, whom he greatly favored, to that of Julius Robert von Mayer, who was a founding thinker in thermodynamics, perhaps the earliest to state the First Law.[109, 110]

Boscovich held that *point-particles*—particles that existed as *geometric points*, having no dimension—had a relationship to a field.[111] By Boscovich's view, each point-particle extended to the boundary of the

---

[104] Hawking², 72

[105] Hawking clearly adheres to concepts that cannot be directly observed, including those in particle physics

[106] And probably before that in Egypt or the East

[107] Field theory had its predecessor in the various theories of forms and magnetism that can be widely found in thinkers such as Pythagoras, Plato, Plotinus, and in the Merkaba mysticism of Kabbalists and some Gnostics, and which was carried down in the mysteries of the Rosicrucians, entertained also in the thought of Jesuits, coming to inspire people such as Mesmer and Swedenborg, and eventually Boscovich. It has been thought about for a very long time.

[108] Kant and Swedenborg were two prominent philosophers among the elite of his day

[109] Of course, this does not take into consideration Parmenides and the many other eternalists and derivatives to follow after him

[110] Nietzsche criticized Mayer for having been an atomist of the sort that believes particles to have a physical presence, as more than *point-particles* (particles that are simply dimensional points). Nietzsche held that there is no matter, only force, taking influence from Boscovich in this assertion; for Boscovich, and following Leibniz instead of Newton, particles were geometric points, not having any mass to them. But for many atomists, including Mayer, atoms had a solid form.

[111] Perhaps similar to the later pilot wave theory of David Bohm or the "wavicle" of Arthur Eddington, otherwise expressed widely in quantum literature, following the double-slit experiment, as various renditions of particle-wave duality. This was explored also by William Duane, who, like Boscovich in being before quantum mechanics,

Universe by way of its orientation within the unifying field. He had a model of a *sine wave*, strewn between an attractive and repulsive force, which formulated what he believed to essentially be the wave-function of all things in the Universe, great and small, on every scale. For this view, he is considered to be the founding thinker of Unified Field Theory. However, Boscovich had drawn from many prior sources, and was anticipated to a great degree also by Giordano Bruno.[112]

Giordano Bruno, predecessor of sorts to Boscovich, was also an advocate of the idea of point-particles, as in the Pythagorean tradition. Bruno understood particles to represent instances of the Universe. He opposed the idea of the atomists, whom he otherwise agreed with in many respects, that atoms had a solid form. He opposed their mechanistic philosophy, supporting instead a naturalistic but nonetheless magical organicism. Bruno followed after Anaxagoras, who held that "everything is in everything" because everything can be broken down into smaller and smaller parts, allowing for a fractal-like existence, wherein the macrocosm can exist in the form of the microcosm, and wherein things can develop from other things. Each particle is the seed for everything that exists, and is infinite in number. These seeds were infinitely compacted at the beginning of the world and had no separate identity. It began to spin, by way of mind or *nous*, which orders everything. Bruno held that the World Soul interacted within the aether or vacuum to give life to the Universe.

Particle physics and field theories would continue to interact after Boscovich's influence, eventually giving rise to magnetic field theory, quantum mechanics, and on toward quantum field theory. Modern and postmodern electromagnetic and quantum concepts owe themselves largely to Boscovich.

Quantum physics-proper developed from the thought of a whole list of people.[113] Most famously, quantum physics involves the *double-slit experiment*, wherein light can arguably be shown to have both a particle and a wave nature. Quantum mechanics has many interpretations, from the official Copenhagen interpretation, to the Many Worlds interpretation, to the pilot-wave interpretation, and beyond. Much of the fuss centers on the nature of electrons and photons, including strange behavior such as quantum leaps, quantum tunneling, and quantum entanglement wherein particles appear to pop in and out of existence or to have affects on one another from afar, without interaction by way of any kind of medium. All-in-all, the interpretations of these strange phenomena range.[114] Over time, quantum theory has shifted away from the original quantum mechanics of thinkers such as Niels Bohr and toward quantum electrodynamics and quantum field theory, by way of people such as Paul Dirac, Robert Oppenheimer, Ernst Stueckelberg, and John Archibald Wheeler. These views drew largely from field theory in electromagnetism, as was originally described by Michael Faraday.

Many kinds of influences have gone into the development of quantum theory, from electrodynamics, to thermodynamics, to photodynamics, and on. And many models have been composed to explain the

---

held that there might be some relation between waves and particles, and who described a lattice relationship by which particles and waves could be understood to behave similarly. Alfred Lande would develop these ideas further.

[112] Boscovich's sine-waves are reminiscent of those used in astrology in discussion of the precession of the equinoxes

[113] Such as Hermann von Helmholtz, Phillip Lenard, Julius von Mayer, Louis de Broglie, Niels Bohr, Max Planck, Pascual Jordan, Werner Heisenberg, David Hilbert, Paul Dirac, Max Born, Erwin Schrodinger, Wolfgang Pauli, David Bohm, Richard Feynman, Enrico Fermi, Gunnar Nordstrom, Theodor Kaluza, Oskar Klein, Hugh Everett III, and many others

[114] They include ideas about particles collapsing from waves of probability or possibility, coming into our world from another universe, gaining a positive charge and thereby being tagged into existence, being guided by waves, coming from the future, being sung into existence by vibrating strings, or any of a large number of existing interpretations, including those that remain skeptical of the need to go outside of classical mechanics, optics, or electromagnetism

conditions of the Universe and the nature and origins of its particles and energy, the most institutionalized of which being those centered around various notions in String Theory, M-Theory, and Loop Quantum Gravity, but also including views such as the Exceptionally Simple Theory of Everything, Causal Fermion Systems, Causal Sets, Causal Dynamic Triangulation, and others. The main limit to having already established a Theory of Everything is that physicists have come across trouble when trying to unite the forces of gravity and electromagnetism or, rather, the *electronuclear force* that combines electromagnetism and the *weak* force (together called the *electroweak* force) with the *strong* force; the weak and strong forces being nuclear forces responsible for radiation and nuclear binding. Another issue is in resolving the conflicts of Albert Einstein's theories of relativity with quantum theory.

From String Theory— which suggests that particles are little songs resulting from the vibrations of quantum strings that are wrapped up in as few as six, but sometimes as many as ten or eleven or more dimensions—[115] to the Standard Model of Particle Physics—which presents seventeen particles—, they all tend to complicate matters rather than to make them more readily comprehensible, as should be expected from a reductive, scientific understanding. As D.L. Hotson logically reasons (and I concur), in "Dirac's Equation and the Sea of Negative Energy,"

> The DNA molecule, the basis of life, is arguably the most complex entity known. Yet its code is written using just *four* components, the four bases whose combinations comprise the genetic code. It can be shown by complexity theory that *three* bases would not provide sufficient complexity for this code, and five would be redundant. Yet *any number* of components *could have* been used. However, only four are necessary, only four are used. Further, all stable matter, including all of the chemical elements and their compounds such as DNA, is built of just three components—electron, proton, and neutron. Again only three components are necessary, only three are used. Consider this as a sequence, from more complex to less complex: *four* components are both necessary and sufficient to build DNA, *three* components are both necessary and sufficient to build all stable matter. Does this suggest that to build these three components would require *thirty-six* "fundamental" components, and nearly one hundred entities? Surely not.

It's hard not to think that Hotson here is "just using common sense," that there is really no other way to look at it with any kind of reasoning divorced from superstition. While reductionism of the material-physical sort, used here, is not appropriately applied to the world of human affairs, it most certainly applies to material-physical components of the Universe! Indeed, Anthony Mansueto, in "Cosmic Teleology and the Crisis of the Sciences," says, in a statement aligning with Hotson's view,[116] that

> The aim of science is to explain as much as possible using as little as possible—ie, to reduce the complex diversity of sensory experience to the smallest number of principles possible, and if possible to rise to a single first principle from which, were we to understand it perfectly enough, all particular phenomena could be derived. In the process, we hope to discover what purpose, if any, the universe possesses, and what role we play in the realization of that purpose.[117]

Hotson continues,

[115] As was originally proposed by Yoichiro Nambu, Holger Bech Nielson, and Leonard Susskind
[116] This is not to be misunderstood for Mansueto himself supporting Hotson's view, but that the content of his statement seems to support Hotson's view
[117] Mansueto

> Going by the above sequence, we should instead consider how many components are *necessary* to build electron, proton, and neutron. And here the computer shows the way.
>
> Computer science shows that operations of unlimited complexity can be built up from just two binary components, yes/no, on/off, plus/minus. Since two binary components are all that is *necessary*, by Ockham's razor and the universe's demonstrated parsimony, two binary components should be *sufficient*.[118]

Once again, Hotson is strong on the common sense. If Hotson is right, what are these two components? If not the many-particles models that exist, then what? Hotson himself implies, but does not state outright, that the duality has something to do with the spins and charges of the particles in relation to the "sea of negative energy" in Dirac's equation.[119] It appears to Antonella Vaninni, and I am in agreement, that this has some relation to matter and anti-matter, or to entropy and syntropy. Of course, a complete system is yet to be worked out. Hotson has his approach as everyone does, and I am not sure I would agree with all of the finer details of any of these models. But Hotson's logic on these foundational points seems rock solid, that scientific reductionism serves to make the world more clear and readily-understandable, while contemporary particle physics does the opposite.

Rather than focusing on details of hypotheticals from particle physics and theories of everything that require us to evoke fantastical ideas such as strings, dimensions beyond those we experience ourselves, and that ultimately conduct themselves toward elitism within the university system, *thermodynamics,* the study of heat and heat transference, tends to readily provide something of the beginnings of a Theory of Everything for us, even if not entirely mapped out into equations. Thermodynamics was put forward by a whole list of predecessors and thinkers.[120] It is the study of heat and its processes; but *heat* applies to everything that physically exists: where there is no heat, there is no existence, plain and simple. Even the vacuum of space has some heat, though very little of it. Thus, thermodynamics, the study of heat, is truly the study of everything, or, at least, everything material-physical. And it will serve perfectly fine here for our understanding of the Universe and its astronomical processes, without need to complicate things with the microscopic behaviors and characteristics of hypothetical and existing particles or other highly-theoretical quandering and speculation. Thermodynamics functions on the premise that the amount of matter and energy in the Universe is constant, that mass can be converted into energy but that nothing is truly created or destroyed. Further, all physical processes increase in *entropy*—a tendency toward dissipation— over time, thereby decaying, corroding, chipping, breaking, or generally falling apart, diverging, becoming more chaotic, or etc. As this happens, everything slows, cools, and entropy moves toward its limit. Heat moves only from hot to cold, and not in reverse, and a physical system can never put out more energy than is put into it.

Thermodynamics was originally applied to the realm of classical mechanics, whereas the field theory of Boscovich would tend to lend itself instead toward what would become electromagnetism and quantum theory. Relativity theory would seem to prove a challenge to classical mechanics and its understanding

---

[118] Hotson

[119] Paul Dirac generally treated positrons in his sea of negative energy idea in a way that would anticipate the concept of "electron holes," perhaps an example of multiple discovery. Dirac and Heisenberg (an originator of the hole concept) both acknowledged similarity between the ideas, and Feynman did later on as well. Perhaps the principle difference is that Dirac's sea of negative energy is addressed in a vacuum, whereas electron holes are affiliated with bands of material.

[120] Such as Daniel Fahrenheit, Joseph Black, James Prescott Joule, William Thomson, Robert Boyle, Joseph Louis Gay-Lussac, Nicolas Sadi Carnot ("father of thermodynamics"), Julius Robert von Mayer, Rudolf Clausias, James Clerk Maxwell, Lord Kelvin, Guillaume Amontons, Ludwig Boltzmann, Walter Nernst, Willard Gibbs, and Illya Prigogine, among others

of gravity, particularly when it came to Einstein. However, thermodynamics remains the most fundamental of physical descriptions and cannot be dismissed on the basis of relativity or quantum theory. In fact, when it comes to physical sciences, it seems fair to suggest that thermodynamics deals with the most fundamental of matters, such that *thermodynamics is King of the Physical Sciences*. Nothing in physics is allowed to contradict the laws of thermodynamics.

Biophysics

Thermodynamics, even while King of Physics, would come up against a nemesis of its own: biology. Living things seem to pose a problem for thermodynamics, because of their increase in order and complexity, and unique complex of traits such as animation, response to stimuli, metabolism, fecundity, consciousness, and so on. An example of life's increasing order, life produces complex, organic molecules such as *polymers* that are not found anywhere else in the Universe.[121] These complex molecules are composed themselves of molecules, rather than simple atoms. Human bodies and their organs, composed of polymers, are also highly complex, with many scientists suggesting that the human brain is the most complex thing in the entire known Universe!

The complexity of life and its organic compounds have given us the Oil Age that we are just recently moving away from. Oil, which is said to be the remains of living things—though some argue for abiotic origins[122]—, is the main source of fuel for our combustion technologies. Coal, which is essentially ancient algae and plant matter, is another source of thermodynamic *work*, or forceful action, converted from heat associated with combustion. Plants originally derive their energy from the Sun by way of photosynthesis, and this energy is passed up to animals in the *trophic pyramid*, or food chain. So the fuel that we combust is energy stored from the Sun in plants and animals, which they use to grow in order and complexity, and let off as they live and especially when they die.[123] This kind of order and complexity is only found in living things.

Thermodynamically-speaking, the order of life runs in reverse of entropy,[124] which is why Erwin Schrodinger controversially called life's essence "*negative entropy*" in his work, *What is Life?*, implying an uncomfortable departure from the Second Law of Thermodynamics. He said that "living matter, while not eluding the 'laws of physics' as established up to date, is likely to involve 'other laws of physics' hitherto unknown, which however, once they have been revealed, will form just as integral a part of science as the former."[125] Lord Kelvin held that Charles Darwin's theory of evolution by natural selection conflicted with the laws of thermodynamics. Ernst Haeckel held that the Second Law was

---

[121] These polymers are created by way of syntropy. But do not mistake this for syntropy acting on matter. Rather, syntropy is acting on, or, rather, expressing substance. The causality between matter and mind is still kept distinct, because matter is caused by the past, whereas mind is caused by the future. These are nonetheless expressions of the same neutral substance, which is beyond or is both phenomenal and noumenal.

[122] In such a case, the origin may have some relationship to the origins of life in "black smokers," discussed later, perhaps being "prebiotic"

[123] Many will correctly point out that the Earth is not a closed system and that the order of plants and animals therefor does not violate the Second Law of Thermodynamics. This is correct to the extent that the energy is made available, but not to the extent that the energy is photosynthesized and later metabolized. These processes are driven from within the organism, and do not amount to a "piling up" of energy in the way that sand piles up into a dune. The sand dune would require metabolism, cellular structure, response to stimuli, fecundity, increase of structure by non-mechanical means, and many more attributes to be considered alive. These attributes, absent in a pile of dirt, flow from within an organism and are not caused from without. They are teleological in nature, rather than mechanical.

[124] Mainstream scientists like to claim that this is not the case, because the Earth is not a closed system, while also suggesting that things don't randomly come together on Earth— that spilled water doesn't go back into the glass—, even if the Sun beats down on them, due to the Second Law. This is a contradiction.

[125] Schrodinger, 68

entirely incompatible with the First. More importantly is what Luigi Fantappié identified as *syntropy*, a "converging tendency."[126] Luigi Fantappié's notion of *syntropy* suggests that entropy—which is responsible for thermodynamic time, or time as we know it— has a corollary, which moves in the reverse in some respects. As Amit Goswami says in *Creative Evolution: A Physicist's Resolution between Darwinism and Intelligent Design*, "[t]he physical arrow of time is an arrow of entropy."[127] Because the physical arrow of time is usually associated with entropy, or increasing disorder, a *biological arrow of time,* of increasing order, has had to be distinguished from the *thermodynamic* arrow of time.[128] Goswami says,

> Biology [...] gives an empirical arrow of time. Biological organisms move toward increasing complexity. But biological complexity consists of more order and thus is the opposite of entropy, which is disorder. So the two arrows are not compatible.[129]

If time moves forward, according to entropy, then biological time moves backward, according to syntropy; this is why it is said that life is caused by the future, while death (lifeless matter) is caused by the past.[130]

Syntropy was a notion promoted by Albert Szent-Györgyi, Buckminster Fuller, and other great minds. Thinkers such as these, and their resurrectors, Antonella Vannini and Ulisse Di Corpo, in some ways echo ancient vitalist thinkers like Aristotle, who suggested that living things owe their life to teleology, another word for syntropy—the opposite of entropy— or its necessary corollary, *retrocausality*, also called *finality* or *end-directedness*.[131] It is worth mentioning also that Empedocles, an Ancient Greek pantheist, spoke of the Universe as containing two fundamental forces, those of *Love* and of *Strife*.[132] Entropy and syntropy appear to be quite similar forces, spoken of in thermodynamic terms. Looked at through the lens of the perennial philosophy, we might suggest that most worldviews are interpretations of aspects of the same natural forces.

Syntropy is, to the view of thinkers such as Antonella Vannini and Ulisse Di Corpo, such as in "The evolution of life according to the law of syntropy," the ground that gives rise to biological evolution. It is

---

[126] Others would follow in departing from the dominance over the biological world by the classically-stated (new statements are attempted by people such as Adrian Bejan) Second Law of Thermodynamics, such as Albert-Szent Gyorgyi, Illya Prigogine, Buckminster Fuller, and Frank Tipler, to name a few.

[127] Goswami[1], 69

[128] *Psychological time*—time as we experience it—serves as an experience of the interplay between the more visible entropic time and the invisible syntropic time (invisible because the future appears as invisible and undefined to us, while the past appears as having already been visibly determined; not because supernatural). Of course, the fact that we unconsciously make our decisions, before we are aware we have made them, as shown by Benjamin Libet, demonstrates that, to a certain extent, we are ultimately, metaphysically identified with awareness rather than decision-making. However, that our awareness is affixed to or situated within a particular human body makes it nonetheless practical to identify ourselves with that body in everyday life. But the Libet Experiment nonetheless demonstrates that we are no more identifiable with the psychic aspect of being than we are with the physical, that entropy and syntropy, mind and body, are ultimately illusory, in that we are better identified with the eternal witness behind our mental and material existence.

[129] Goswami[1], 70

[130] The fundamentals of time—time itself being something of an aspect of the eternal Whole, a deficiency of wholeness— are rooted in an understanding of physics and biology, in *thermodynamic time*, which is physically governed by *entropy*, meaning "divergent tendency," and *biological time*, which is governed by *syntropy*, a "convergent tendency."

[131] These sorts of ideas had also influenced the heretics and radicals from which Mutualism would come— as in Baruch Spinoza's concept of *conatus* (inner impulse to live), and Herbert Spencer's organic approach to social evolution—, but would be lost to some of them upon the wide adoption of the *mechanical philosophy*, that all of reality functions like an inanimate machine

[132] Not completely dissimilar, the French Mutualist, Pierre-Joseph Proudhon, held a Heraclitean or Manichean sort of dualism between the forces of Liberty and Authority

especially relatable to that part of evolution that biologists like to attribute to "chance," "random," or "accidental" mutations.[133] Nature deals out novelty from the future, by way of teleological or retrocausal processes that, when viewed through psychological time[134] and the inductive method[135]— lenses through which the future and its contents are invisible—, quite reasonably appear to be "random" or otherwise unexplainable.[136] Once these "random" mutations occur, actually coming from the future, they are put to the test of natural selection, the present, which ultimately uncovers their future origin, thereby telling us from how far from the future the mutation has traveled. It cannot have come from a future in which it bears no existence.[137] The future appears, in the life of the organism, as a transcendental impulse for increasing amounts of order, and it is within this demand for increasing order that the biological mechanics of living and evolution take place.[138] The biological demand for increasing order translates into psychological motivation to take certain actions.

Perhaps the catalyst for the complexity of life is the *hydrogen bridge*, a phenomenon within water. It is well known that life needs water to exist, and the reason for this may be that the hydrogen bridge allows for quantum processes to take place on the scale of the organism, allowing classical entropy to be surpassed and order and complexity to be presented. Ulisse Di Corpo and Antonella Vannini, for instance, tell us, in "Syntropy, Cosmology and Life," that

> In 1925 the physicist Wolfgang Pauli [...] discovered in water molecules the hydrogen bridge (or hydrogen bonding). Hydrogen atoms in water molecules share an intermediate position between the subatomic level (quantum) and the molecular level (macrocosm), and provide a bridge that allows syntropy (cohesive forces) to flow from the quantum level to the macroscopic level.[139]

Ulisse Di Corpo and Antonella Vannini elaborate in "Syntropy and Water," saying that

---

[133] See Vannini[1] and Di Corpo

[134] Time as experienced by humans, moving from past to future.

[135] Induction is looking at the past for explanation, or *a posteriori*, empirical logic

[136] Naturally, that which comes from the future will— like past attempts to do the same with "dark energy"— fail to be directly observed through the instruments of inductive science. This is because science relies on the control of conditions, while humans cannot control conditions from the future; and retrocausality is determination from the future.

[137] It's also important to be aware that there is what theoretical physicists refer to as *imaginary time*, which may have its material existence in perpendicular locations of the multiverse, and which explains concepts that have been perceived but unrealized in our own timeline. Whether we are in the Best of All Possible Worlds or are in one universe within a grander Universe, a multiverse— as described by thinkers like Hugh Everett or Brian Greene— within an Omniverse, is for the reader to decide, but Reason does seem to permit the existence of dimensions outside of the three physical dimensions of length, width, and height and the additional dimension of time— together called *spacetime*, a concept developed by Hermann Minkowski— such that other universes, perhaps cycles of our own, in some greater scheme, may be permissible. A multiverse would allow for more than simple repetition, and would allow for different versions to occur. But, still, there would always result a set of all sets, a Uni- or Omniverse. Repetition would still be necessary, and all still fixed in place and eternal. For the sake of this work, however, it will be assumed that there are only four dimensions to existence, those of which we are directly aware. Anything else is treated as a hypothetical with merit similar to myth or legend, and is considered unlikely though possible. In the author's opinion, "imaginary time" does not run perpendicular to classical time, but rather is found "on the slant" between the spatial dimensions and time when seen on an x and y axis, representing the variations of spacetime that result from coordination of space and time.

[138] It is necessary to declare the limits of science at some point, so as not to engage in scientism, or to demand scientific answers where there is a *problem of induction*, as described by Pyrrho. Rather, we must submit ourselves to the pragmatic and intuitive use of deduction, abduction, and faith, albeit the sort that bends upon being presented with new evidence. We don't know what the future is, we have not seen it—it is invisible—, but we know that it is there, and that must be enough for us to get by.

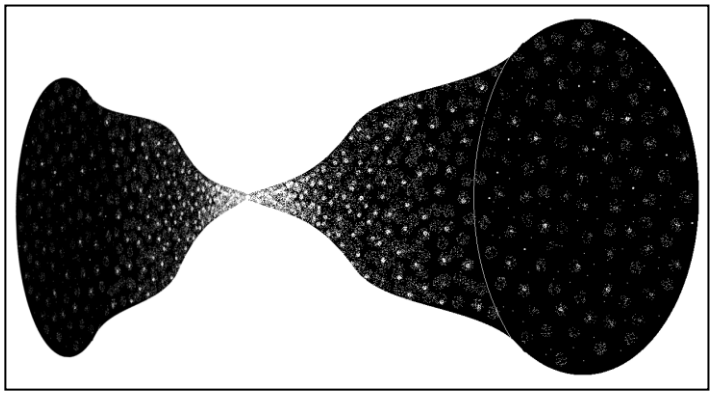
[139] Di Corpo[1] and Vannini

> instead of creating a tie with the oxygen atom, the hydrogen atom links to the electrons, forming in this way a bridge between the subatomic level (electrons) and the atomic level (hydrogen atom). This bridge between the inner level of the atom (micro) and the outer level of the atom (macro) allows syntropy to flow from the micro to the macro level.[140]

In this way, life, by being made from water, is able to exhibit signs of quantum indeterminacy or "free will" on a larger scale. Just as subatomic particles are unpredictable, so too are the behaviors of living organisms. It seems that it is in this way that the purposive forces of the Universe are invisibly relayed to us from the future, serving as the mechanism of desire, will, and motivation in us, commanding us to seek satisfaction in the Good and seeking one another out in order to approximate this good. Ulisse says, in "Life Energy, Syntropy, Complementarity and Resonance," that the "forward-in-time solution describes energy that diverges from a cause, and requires that causes be in the past and the backward-in-time solution describes energy that converges towards an attractor, a future cause."[141]

Viktor Schauberger had believed water to be a living thing with vital needs that, if it did not get what it needed, would become destructive. He demonstrated that water likes to move in vortices, spirals, or oscillations. A forester by trade, Schauberger was a naturalist who believed that we should "comprehend and copy Nature," designing inventions to clean water and generate power from the same dynamics he witnessed in the mountains and streams during his forestry service, and creating a copper plow that digs similarly to a mole and that apparently does not cause as much damage to the soil microorganisms, posing a challenge to both traditional tilling and no-till methods of agriculture. He also developed ways to derive energy from properly-treated water. Schauberger believed that combustion technologies are technologies of death. Schauberger's discoveries, which also included recognition of the dynamics of water or hydrology, would contribute to the finding of what is now called *E-Z water*, or "structured water," which has phenomenal, syntropic properties. He warned that we are not drinking properly healthy water, and designed ways to cycle water for health before drinking it.

The new outlook on life creates a picture of the Big Bang that might look something like this:



Big Bounce as imagined with a standard depiction of the Big Bang
(If parallel universes exist, as in a multiverse, they begin their existence from the same singularity[142]*)*

[140] Di Corpo[2] and Vannini
[141] Di Corpo[3]
[142] Alternately, and quite likely, the shape presented by the mainstream, which assumes presentism and "creation *ex nihilo*" is wrong. Nonetheless, the general idea remains the same, an expansion from, and contraction to, singularity.

The singularity existing before the Big Bang explodes thereby causing a development that would lead up to our present condition. But because the physical laws are laws of entropy, the Universe was on a dead-end course, and was going to perish. But then life appeared, bringing syntropy with it.[143] Life emerges throughout the Universe, thereby awakening the dead matter, *anima*ting it like *anima*ls. Syntropy saves the Universe from a thermodynamic heat death that would be its end, forever; because syntropy turns the Big Bang into a Big Bounce.[144, 145] The end of that Universe was the beginning of this one. But that's not it: That Universe, which is collapsing, is *in this* Universe, which is expanding; and it takes the form of biological organisms, like you and me, given the purpose of moving back toward this singularity. This is the source of meaning and purpose in the Universe— and, by extension, our lives—, which has been variously referred to as *telos*, the *Source*, *Heaven*, *Moksha*, or etc. Aristotle, the famed Ancient Greek philosopher, taught us that we are happier when we are aware of this, and when we live a life of virtue, keeping our purpose in mind. The purpose of life at-large is to put the Universe together, to be a counterveiling force to entropy, which is chaos and disorder. The *convergent evolution* of life, the development toward the Source, across the cosmos, and perhaps even one day the colonization of the stars, will awaken the Universe, will animate it, once dead, with life, thereby establishing order. This large-scale purpose translates into the pursuits of our daily life, which are intended to serve us well, but serve us best when we act *virtuously*, or in a balanced fashion. Aristotle tells us that it is in knowing that we may be virtuous, and in being virtuous we find happiness, the ends pursued by all of our actions. When we are happy, we know we are well serving the Cosmic Purpose in serving our own.

The idea behind syntropy starts out with Einstein's popularization of relativity. Ulisse Di Corpo regularly points out in his work that Einstein had predecessors and that he changed his equation from the original mass-momentum equations so as not to include the negative-time solution, the solution of *syntropy*, the opposite of entropy. In "An Introduction to Syntropy," for instance, Di Corpo tells us that

> The energy mass relation that we all associate with Einstein had been published by Oliver Heaviside in 1890, by Henri Poincaré in 1900 and by Olinto de Pretto in 1903. However, the momentum, which is a fundamental part of energy, was missing.
>
> In 1905 Einstein added the momentum in his energy-momentum-mass equation. But there is a problem, energy is squared and we must use a square root. Two solutions are obtained: positive time energy that diverges forward in time and negative time energy that diverges backwards in time.
>
> Negative time energy was considered impossible because it implies retrocausality. Einstein decided to eliminate the momentum since the speed of physical bodies is practically zero when compared to the speed of light. In this way we return to the famous energy-mass relation which always has only one positive time solution.

---

[143] This is actually backwards, because syntropy implies eternalism, but it gets the idea across nonetheless

[144] Meaning that the Big Bang did not occur from a singularity that was stagnant but one moment was thrown off balance and exploded— as is suggested by many scientists—, but that it was a transition from a prior Universe that had just gone through a Big Crunch. Rather than a Big Bang to Big Freeze cosmology, syntropy would seem to support a Big Bounce (alternately, a "Big Pulse" or a "Big Oscillation") cosmology, wherein life is a mechanism of cosmic recombination back toward the singularity as it existed before cosmic inflation.

[145] Some cosmologies, oriented more in plasmatics or electromagnetism, tend to prefer to refer to what is otherwise called an *oscillating* or *cyclical Universe* that makes use Big Bang terminology like the *Big Bounce* in terms of pulsation; perhaps a *Big Pulse* might be acceptable. A Pythagorean or Nietzschean might speak in terms of the *eternal return* or the *eternal recurrence*. Nietzsche famously described this as a consequence of having finite material and infinite time. He logically pointed out that with a finite amount of stuff and an infinite amount of time, one is limited in the number of assortments or combinations that can be had, and one is left to repeat them.

> In 1924 the spin of the electrons that is close to the speed of light was discovered. In quantum mechanics the uncomfortable energy-momentum-mass relation must be used with its dual solution. We have a world that cannot be explained in a classical way.[146]

This is the world that pushed people such as Ernst Mach away, forcing him to declare himself and his efforts apart from the relativists. Ulisse Di Corpo and Antonella Vaninni point further to the work of the important mathematician Luigi Fantappié, who, aware of this, went about resolving the conflict between the physical and biological worldview. Ulisse Di Corpo and Antonella Vaninni, on their website's homepage at syntropy.org, describe Fantappié's vision thusly:

> Luigi Fantappié, working on the mathematical properties of the two energy solutions, discovered that the positive-time solution is governed by the law of entropy, that is the tendency of energy to disperse in the environment, while the negative-time solution is governed by a symmetrical law that Fantappié named *syntropy* (combining the Greek *sin* = converge and tropos = *tendency*). Syntropy leads energy to concentrate, to increase differentiation, complexity, and to create structures. These properties describe life. Fantappié thus arrived at the formulation of the *Unitary Theory of the Physical and Biological World* in which energy is a unity that cannot be created or destroyed (first principle of thermodynamics) and the entropic polarity describes the material, visible world, while the syntropic polarity describes the invisible properties of life and consciousness. This theory was censored and Fantappié was accused of not being able to produce any experimental evidence.[147]

It is unfortunate— but not unexpected!—, that, like many of the people in this Big History of heresy and radicalism, Fantappié would come up against the authorities, who decided that he needed to be shut down. Censorship in philosophy, science, and the humanities appears to be increasingly common in an age wherein scientists— who by their nature should expect to be challenged and contradicted, as the nature of science calls for— have been turned into a sort of priesthood.

Before the World Wars era, it seemed as if all of the laws of physics had been worked out in the most general sense, with only some details to fill in. Relativity and quantum mechanics, however, would suggest that the world is much more full of novelty than had been previously expected. The attempt to describe the world by way of completely mechanistic-deterministic laws had failed, uncovering terms of "uncertainty." This has demonstrated the limits of physics, leaving it to step in one of two directions, either toward supernaturalism or toward biological truths. Quantum outlooks would step increasingly toward irrational mysticism and the rejection of common sense and sense experience, whereas biology would largely maintain a rationalistic and naturalistic, although still awe-filled, approach that affirmed the senses, rationality, and the self-evident. Luigi Fantappié's solution incorporated mechanism into an organic Universe. Thus, Fantappié was truly threatening the establishment. Di Corpo relays to us that Fantappié's insights have since been seriously suppressed. He says, in "Syntropy: a third possibility in the debate on evolution," that

> Luigi Fantappié published the "Unitary Theory of the Physical and Biological World" and received wide attention, but, after the Second World War, he had to face violent personal attacks. Luigi Fantappié died in 1956 leaving his precious documents carefully catalogued and numbered [...] I contacted his family who allowed me to scan his documents which, afterwards, I put back in the original chronological order which he had used; but, with great surprise, I

[146] Di Corpo[4]
[147] Di Corpo[5] and Vaninni

> discovered that all the documents relative to syntropy were missing. Only these documents had been removed.[148]

Not only that, but Ulisse Di Corpo and his partner, Antonella Vaninni, themselves, have experienced personal threats and attacks, as they report:

> Ulisse Di Corpo was approached by people who qualified themselves by showing copies of the original correspondence between Fantappié and Richard Feynman. He was ordered and threatened to immediately stop his work on syntropy. Antonella became the object of very violent attacks, not on a scientific level, but on a personal one.[149]

These threats exist for a reason. Life science does not just pose a problem for thermodynamics, but for the entire mechanical philosophy, upon rests the entire *paradigm*, the entire system-structure, of the ruling class. A Universe imbued with life is not subject to pure *efficient causation* or physical-mechanical forces, it is not simply *fated* from outside, able to be enslaved, but also contains a *purpose* and a *destiny* guided by final causation, which acts from *within*, and not simply from *without* (matter and the individuals composed of it). The radicals, whom the ruling class feared most throughout history, tended to the organicist view that the future contains novelty that unfolds by way of the *conatus* (or "striving impetus") that is immanent within matter and that shows itself to be particularly strong in living creatures. As such, they tended to the view that all novelty was owed to uniqueness and causes that were themselves novel. By this formulation, it is impossible to fully categorize the causes in Nature, owing to the uniqueness and novelty in every moment. This kind of outlook was prominent in organic thinkers such as Giordano Bruno, Baruch Spinoza, Herbert Spencer, Ernst Haeckel, Paul Carus, and many others, to varying extents.

While teleology, which explains the causality behind life's striving, has its home in the classical physics of Aristotle, among others, since the time of the Moderate Enlightenment any discussion regarding teleology has increasingly tended to be frowned down upon as dissent from the mechanical philosophy. But this seems to pose more of a problem for modern physics than it does for one of the most persistent elements in Nature, which does not care if it is recognized by human establishments or not, but continues evermore onward without human consent. Anthony Mansueto aptly remarks that he would like to

> argue that science is entering [...] a crisis which is rooted in an inability to theorize "ordering to an end" and which will be resolved only by a return to teleological explanation, albeit a teleology expanded to accommodate the reality of chaos, contradiction, and even disintegration, all of which clearly form part of material reality.[150]

Anthony says,

> As Aristotle demonstrated, only teleological argumentation offers a complete scientific explanation, and authentic teleology is effectively ruled out by the hegemonic scientific paradigm which gives first place to mathematical formalism—something which makes possible rigorous description but not authentic explanation.[151]

---

[148] Di Corpo[6]
[149] Di Corpo[5] and Vannini
[150] Mansueto
[151] Mansueto

The complexity of living things is one of the major downfalls of an entirely *mechanistic* and *physicalist* view of the Universe—one that operates on entropy alone— because the complexity of life disturbs classical definitions of *entropy* and is beyond the scope of physics, such that they have to be reworked to include increasing order and complexity. Entropy, however, was conceived as decreasing order and complexity, as can be readily understood in its etymology, "divergent tendency." Lord Kelvin, a founding figure in thermodynamics, had held that biological order and evolution seemed to go against the Second Law of Thermodynamics. For this reason, this scientist clinged to the Christian religion for answers to life's origin. Syntropy offers an alternative (or perhaps complementary) explanation from within the Universe.[152] This alternative possibility could revive a static model of the Universe on the largest scale, though it would suggest a cyclical or oscillating modal cosmology, a sort of *semiternity*, or ever-continuing process, within an unchanging eternity.

As it stands, the syntropic view is pure heresy. Albert Einstein, Wolfgang Pauli, and Paul Dirac had all been pressured into removing "negative" time from their equations,[153] much as Luigi Fantappié's papers on syntropy and his unified theory of everything have mysteriously been removed from the deceased's personal collection.[154] Syntropy is a concept that could overturn the existing scientific paradigm completely. It would provide a completely different set of assumptions that could favor such institutionally-"discredited" geological and biological heresies as an expanding or growing Earth and morphological structuralism, vitalism, and multiregional evolution, to name a few.[155] However, it would first have to overturn the Standard Model in cosmology, including established particle physics.[156] The success in these other areas would likely follow a reevaluation of the Standard Model of cosmology, starting perhaps with the Second Law of Thermodynamics.

Many forbidden hypotheses come from a time before the World Wars era. Ulisse Di Corpo and Antonella Vannini suggest, in "the Decline of Science," that come "the end of World War II, any finding

---

[152] However, this is not "within the Universe" as understood in terms of *presentism*—seeing only the present as existing—, but of eternalism, wherein the Universe is understood to span past, present, and future all at once. If *the Universe* is a term that means only that which presently exists in our timeframe, then there is most certainly something outside of that. Similarly, if *Nature* is taken to mean only the present, then there is most assuredly something that is supernatural. These are not the definitions here used!

[153] See Di Corpo[7] and Vannini

[154] See Di Corpo[6]

[155] Expanding or growing Earth theories have been favored by geologists such as Robert Mantovi, John Joly, Ivan Yarkovsky, Samuel Carey, James Maxlow, Nikola Tesla, and Neal Adams. Syntropy might support Neal's hypothesis that the Earth grows by way of pair production at the core. If the Earth does, indeed, grow, this may show some further support for the hypotheses of paleontologists such as William Diller Matthew or George Gaylord Simpson, whose views about the migration or "expansion and contraction of species" coincide well with an expanding or expanding and contracting Earth. Morphological structuralism, such as that of D'Arcy Thompson or Adolf Seilacher, would place morphological structures outside of philosophical materialism, and syntropy might provide the grounds of idealism on which to give structuralism a foundation. Vitalism and origanicism, which had its origins perhaps in the teleology of Aristotle, would clearly find support in syntropy. Daniele Rosa's idea of *hologenesis*, an orthogenetic idea that suggested that evolution was driven primarily by internal factors, might find some support. He is famous for the establishing that animals tend to become more specialized over time, stated as *Rosa's Rule*. Leon Croizat, inspired by hologenesis, established his own theory called *panbiogeography*, which traced "tracks" of animals across the continents and oceans, *tracks* referring to straight lines connecting findings of a particular animal taxons on a map. He considered evolution to involved dynamics of time, space, and form, with animal forms becoming more specialized as they moved through time and space. The tracks suggest connections between animals of different continents, seemingly in support of a growing Earth. The multiregional hypothesis of Milford Wolpoff, Alan Thorne, and Xinzhi Wu, and perhaps even some of the physical anthropological work of Carleton S. Coon, might also find some revived support from syntropian thermodynamics.

[156] This has been achieved philosophically already, but must be accepted by a society that has been indoctrinated with the new religion of materialism, a project still in the works

which was extending science beyond mechanical causation was censored and fiercely suppressed."[157, 158] The existing model was established (during the decline of Mutualism) upon premises of the Nazi scientist Heisenberg. Heisenberg gives us the "uncertainty principle." But Paul Dirac's equations had previously included negative energy,[159] which had implied retrocausality, or syntropy.

The Stars and Planets

People have probably practiced astronomy since before the existence of *Homo sapiens*, modern humans, our ancestors having long used the stars to navigate their way across terrestrial and nautical space. Indeed, stellar objects are to be found among the oldest myths of humanity and are spattered across many of the earliest artifacts of archaeology. Early *astronomy*, the study of the stars, would be mixed with metaphysical beliefs, giving way to astrophysical systems of correlation, such as are found widely in *astrology*, the belief that the stars affect the way things are on Earth according to a fixed and cyclical system. Gods and stars or planets, such as Jupiter, Mars, and Venus, would bear the same names. Modern astronomy would come to reject astrology, while embracing still the material-physical observations of the stars. Whereas astrology placed the Earth at the center of the Universe, modern astronomers such as Nicholas Copernicus, Giordano Bruno, Galileo Galilei, Johannes Kepler, and Isaac Newton moved toward the view that the Earth, instead, orbited the Sun. They had followed after Nicholas of Cusa's suggestion that the Universe had no circumference and that its center was all-pervasive. This had begun the modern journey toward a natural conceptualization of the Cosmos established upon scientific observation and rational discourse. Bruno's ideas would ultimately be developed into the Big Bang theory.

The most immediate moment after the Big Bang, suggest mainstream physics, saw its size at a *Planck Length*, the smallest size, named after Max Planck. At this moment the Universe can be said to have been very dense and hot. One could say that it was *Absolute Hot*, the hottest one can get on the Kelvin[160] or any other scale. As the Universe continued from there, it expanded and cooled in a process of entropy. Brian Greene, in *The Fabric of the Cosmos*, describes it this way:

> When things get very hot or very cold, they sometimes change. And sometimes that change is so pronounced that you can't even recognize the things with which you began. Because of the torrid conditions after the bang, and the subsequent rapid drop in temperature as space expanded and cooled, understanding the effects of temperature change is crucial to grappling with the early history of the universe.[161]

As the Universe spread out from the entropy, the diverging tendency of the Big Bang, and cooled and expanded, it lead to major *phase transitions* and cosmological *epochs*. These phase transitions and their epochs are largely defined by their fundamental forces. These forces are gravity, electromagnetism, and the strong and weak nuclear forces. At one time, suggest many physicists, these forces were united under a single principle, before diverging from one another in the process of entropy. As Brian Greene says, "there might actually be a single fundamental force of nature that, through a series of cosmological phase transitions, has crystallized into the four seemingly different forces of

---

[157] Di Corpo[7] and Vannini

[158] Interestingly enough, this coincides also with the time period just before Mutualism had really started to decline (as will be discussed later in the book). Science and organized labor would not be the same after the World Wars, Spanish Flu, Great Depression, New Deal, the Civil Rights movement, and the rise of globalism and the New Left. Science and Mutualism seem to have largely declined together.

[159] See Hotson

[160] Named after "Lord" Kelvin, its inventor

[161] Greene[1], 252

which we are currently aware."[162] He says, "[t]he changes from solid to liquid and liquid to gas are known as *phase transitions*. Most substances go through a similar sequence of changes if their temperatures are varied through a wide enough range."[163] Also,

> During much of this decrease in temperature, not much has happened. But there is reason to believe that when the universe passed through certain critical temperatures [...] it underwent radical change and experienced a drastic reduction in symmetry. Many physicists believe that we are now living in a "condensed" or "frozen" phase of the universe, one that is profoundly different from earlier epochs. The cosmological phase transitions did not literally involve a gas condensing into a liquid, or a liquid freezing into a solid, although there are many qualitative similarities with these more familiar examples. Rather, the "substance" that condensed or froze when the universe cooled through particular temperatures is a field[164]

Green attributes this field to the Higgs field, later described as having some relation to the older, previously rejected concept of the *aether*[165] and then to quantum field theory. By views such as Greene's, the Universe is a field that reacts to temperature as entropy ensues, giving way to phase transitions that take the form of cosmological epochs. These epochs lead to new configurations and new paradigms of matter and energy, such that laws that were once united become divided, and new forms and relations of matter show themselves.

Cooling, along with physical and chemical processes within the Universe, seems to have led to the formation of proto-galaxies, in a process called *recombination*. From molecular clouds such as *nebulae*— gas clouds from within the recombined proto-galaxy— formed stars in a process called *collapse*, wherein— according to the nebular hypothesis of Emanuel Swedenborg, Immanuel Kant, and Pierre Laplace, combined with theories of accretion and other dynamics— the mutual gravity of the gas clouds combines to outperform their pressure, leading them to condense. John D. Fix, in *Astronomy: Journey to the Cosmic Frontier*, says that

> Stars form inside relatively dense concentrations of interstellar gas and dust known as molecular clouds. These regions are referred to as "molecular" because they are cool and dense enough that most of the gas that they contain consists of molecules rather than atoms or ions.[166]

Arthur Eddington was a supporter of this view. Competing theories exist, however, including those coming from the Electric Universe and Plasma Universe models, often rooted in the work of people such as Velikovsky, Alfven, Kristian Birkeland, Charles E.R. Bruce, Ralph E. Juergens, and Anthony Peratt, among others. Alternatively, electromagnetism and plasmadynamics have been pointed to as explanations for the behavior of molecular clouds or nebulae, the formation of stars and planets, galactic rotation, among other things. Proponents of electromagnetic or plasmatic cosmologies point to the filamentation involved in molecular clouds and nebulae, for instance, as well as to geological features such as arches, layering, and canyons shaped like lightning or fractals. Proponents of the view suggest at times that an electromagnetic Universe has no need for concepts such as *dark matter* and *dark energy*—mysterious concepts involving abnormal substances, theorized by mainstream astrophysicists—, suggesting that plasmatic filamentation in molecular clouds reaches out in

[162] Greene[1], 266

[166] Fix, 414

electromagnetic fields to collect more matter from what is commonly viewed as empty space. For instance, Hannes Alfven, in "Cosmology in the Plasma Universe," suggests that

> Space is filled with a network of currents which transfer energy and momentum over large or very large distances. The currents often pinch to filamentary or surface currents. The latter are likely to give space, as also interstellar and intergalactic space, a cellular structure.[167]

Plasma thinkers, such as Alfven, generally deny Big Bang cosmologies, suggesting, instead, that the Universe has always existed and always will exist. Alfven says, for instance (as popularly quoted) that there "is no rational reason to doubt that the universe has existed indefinitely, for an infinite time. It is only myth that attempts to say how the universe came to be." They hold that plasma is the dominant organizing force in the Universe. Some of the plasma or electromagnetic cosmologists, such as Immanuel Velikovsky and Anthony Peratt, step outside of the disciplines of physical science and into fields of social science, like anthropology of myth and religion, to support their claims, pointing to primitive or ancient art that depicts electromagnetic or plasmatic features, as if they had occurred in the sky during their time. Whether remaining in the physical sciences or branching out, the plasma or electromagnetic cosmologists have been essentially pushed out of the conversation. Velikovsky stood as an example of how interdisciplinary science was pushed out of the conversation during the "Velikovsky affair," in which Velikovsky was denied the ability to face his critics using the public forums. For this repression he compared himself to Giordano Bruno. Similarly, Alfven had famously said, in "Memoirs of a Dissident Scientist," that, when he described plasma phenomena,

> most referees do not understand what I say and turn down my papers. With the referee system which rules US science today, this means that my papers are rarely accepted by the leading US journals.[168]

This is an all too common treatment of intellectuals who dare to think outside of the box. It seems this became particularly troublesome during and after the World Wars, *the postmodern era*.[169] At the same time, Thermoelectric Peltier cooling suggests that electricity may result from or have an intricate relationship with hot and cold, that may be able to be reduced to thermodynamics anway, which would nullify the electric foundation of the Universe.

The formation of stars turns a proto-galaxy into a galaxy. *Galaxies*, nebulous clusters of stars, are understood to have a center of orbit, often spiraled or elliptical, around a very massive body in the galactic center, called a *black hole* (or else a nuclear star cluster), the dense gravitational remnant of a *supernova*, or astral explosion. Our spiral galaxy is the *Milky Way* and it orbits our supermassive black hole, *Sagittarius A*.[170] An orbit around the galaxy is called a *Galactic Year*. Because of the entropy of the Big Bang, all of the proto-galaxies and galaxies in space are moving further apart from one another. This has often been described as raisins in a loaf of bread spreading apart as it rises in the oven. Black holes— as is said to exist at the center of our galaxy— were first proposed by John Michell, a natural philosopher and astronomer. They are theorized to be a place from which light cannot escape, called "*dark stars*" by Michell, who proposed them based on the observation that light escaping from a star must fight gravity, such that, in some cases, the star might have gravity strong enough that it requires a

---

[167] Alfven[1]
[168] Alfven[2]
[169] Around the time that Mutualism was being dismantled
[170] Proper science allows room for competing models to be tested and contrasted against one another. While I think something like a Big Bang is likely correct, many important insights have come from those with a dedication otherwise.

speed faster than that of light to escape, meaning that light cannot escape the gravity of the star. On the other side of that black hole, suggested Igor Novikov— basing his idea on Einstein and Rosen's concept of a *wormhole*—, was a *white hole*, wherefrom everything that goes into the black hole comes out. Some in the plasma cosmology crowd, having begun with Alfven perhaps, remain suspiscious of the existence of black holes (and neutron stars) at all.[171]

Star systems, found within galaxies, contain one or more stars, often orbited by planetary sytems, planetoids, asteroids, or other bodies. A star that maintains an internal equilibrium, such that the pressure balances the gravity from collapsing further, causing an event such as a *supernova*—a giant explosion that could theoretically leave behind a black hole—, and which produces heat in its core through thermonuclear processes, is called a *main-sequence star*. Our *Solar system* is a star system that revolves around the Sun. Our Sun is a main-sequence star, the center of our solar system, and all stars spend some time as main-sequence stars. As John D. Fix tells us,

> The main sequence phase in the evolution of a star is the period of time when it is consuming hydrogen in its core. It is a period of stability during which both the structure and appearance of the star change only gradually.[172]

The Solar system contains the planets, such as Mercury, Venus, Earth, Mars, Saturn, Jupiter, Uranus, Neptune, and, if you count it, Pluto. There are other objects considered, like Pluto today, to be planetoids, as well as an asteroid belt, among other objects and gases. And, of course, many of the planets have their own moons that orbit them. Planets and perhaps moons are created in a similar manner to stars, in a process of *accretion*, although they may fragment from collisions, which are used as an explanation for the formation of moons. However, the story may be more complicated, as our star has been considered in relation to a possible binary partner, to which it is entangled from without the local solar system, HD 186302. Whatever the case, each time around the Sun is, obviously, a year. As Dinah L. Moche puts it,

> The *solar nebular model* says that the solar system formed out of an Eastward rotating interstellar cloud [...] The nebula contracted into the proto-Sun surrounded by a spinning disc where the planets formed as dust and gas accreted. The new Sun blew away most residual dust and gas.
>

---

[171] Perhaps the singularity was something like a white hole—the opposite of a black hole, first described by Igor Novikov— and the Universe was what was expelled from it in the Big Bang. A Big Crunch—as proposed by John Wheeler, who gave black holes their name— had sucked in a prior Universe, if that is the case. But that prior Universe may be our present Universe. Especially in the case we live in the "best of all possible worlds" described by Spinoza and Leibniz. In effect, that Big Crunch event may be the Big Bounce of a "strange loop," wherein biological-syntropic processes— going on right now— culminate in a Big Crunch singularity; and physical-entropic processes— also presently occurring— come from a Big Bang singularity. These Big Crunch and Big Bang singularities, in such a case, are together one and the same Big Bounce singularity, which gives rise to the past and future simultaneously, and thereby the eternal symmetry of time. Mortal experience, then, is of the clash of these forces, perhaps functioning, in a way, like a holograph on one level, and a cartoon flipbook or strip-wheel on another; a multidimensional cartoon strip of a holograph, if you will. Each panel follows the rules of the holograph, providing a dynamic reality from the clashing of forces, but the book, containing all of the possible combinations and orders of combinations, is complete and finalized. Another analogy, though perhaps even more imperfect, is that of a kaleidoscope, the contents of which are permanently fixed, but which nonetheless provides portions for viewing that, upon reflection and the application of time by way of twisting the device, appear to be occurrences or events.

[172] Fix, 437

> All of the planets *revolve*, or travel around, the Sun in the same direction from West to East, or counterclockwise as seen from above. This movement is called *direct motion*. The planets rotate as they revolve. […]
>
> The mean plane of Earth's orbit around the Sun is called the *ecliptic*. The orbits of all of the planets are in nearly the same plane. Like the lanes on a running track.[173]

Each day, of course, results from the rotation of the Earth exposing one half to the Sun at a time. And months come from the waxing and waning cycles of the Moon, from No Moon to Full Moon. As Dinah L. Moche says,

> Earth's rotation provides a basis for keeping time using astronomical observations. The solar day of everyday affairs measures the time interval of Earth's rotation using the Sun for reference. The sidereal day measures the time interval of Earth's rotation using the stars for reference.[174]

She says,

> The Moon's appearance changes regularly every month. Half of the Moon is always lighted by the Sun, but the bright shape we see from Earth, called its phase, changes as the Moon travels around our planet. The recurring cycle of apparent shapes is called the phases of the Moon.[175]

The Moon, itself, has been theorized to have origins from a cataclysmic collision between Earth and a planet called *Theia*, which is suggested to have also given Earth its water, remaining in part as the Moon.

As the Earth orbits the Sun (which orbits Sagittarius A), and due to the Earth's rotation being titled, it undergoes seasonal changes, including Spring, Summer, Fall (or Autumn), and Winter. These result from the tilt of the rotation of the Earth in relation to its orbit around the Sun; that is, the Earth is tilted (perhaps from a collision event) and rotates around its central axis, and because of its tilt its Northern and Southern hemispheres—the "top" and "bottom" of the planet—take turns being closer to the Sun. This occurs throughout the span of a year, the time it takes for the Earth to go around the Sun. But the tilt of the Earth, met by a wobble from a buldge in the Earth created by the Sun and the Moon (and perhaps from growing), also gives rise to the Great Year, perhaps first described on record by Plato or to be inferred from astrological systems in general. The *Great Year* is the end of the cycle called the *precession of the equinoxes,* or *axial precession*. This is the change in the Earth's rotational axis (due to a wobble), whereby periods when the days and nights of the year are equal in length (called *equinoxes*), and the longest and shortest days (called *solstices*), occur in different locations of the *Zodiac* (constellations marking important ages), or along the *ecliptic* (the apparent path of the Sun around the Earth, as seen from Earth). As the path of the Sun's light on the Earth, or the position of the equinoxes in the Zodiac, changes—doing so in a sine-wave-like pattern—, precession is understood to be occurring.[176] As Jan Irvin and Andrew Rutajit tell us, in *Astrotheology and Shamanism*,

> Not only do we spin upon [the Earth's] axis, but due to the gravitational pull of the sun, moon, and other planets, we also wobble on this axis. One complete wobble has

[173] Moche, 194
[174] Moche, 24
[175] Moche, 196
[176] The various ages of precession are often associated with periods of mixed warmth or cold and dryness or wetness, such that one age might be hot and wet while another is hot and dry, still another is cold and wet, and another cold and dry.

> been called a 'Great Year,' 'Stellar Year,' and 'The Precession of the Equinoxes.' The word precession is defined as a slow gyration of the earth's axis around the pole of the ecliptic, caused mainly by the gravitational pull of the sun, moon, and other planets on the earth's equatorial bulge. As the earth wobbles, the axis makes a circle through the heavens.[177]

The equatorial line is a *tropical* region, one where it is very hot, due to the Sun being directly overhead, and often quite humid, with minimal seasonal disturbances, being typified by rainforest and savannah. To each side of this is a *subtropical* band, which might host arid dessert, drought-prone savannahs, or mixed deciduous and coniferous forests, and which experiences short freezes during winter. This is followed by a *temperate* zone where seasonal freezes are a staple feature, and where there are often mixed forests and grasslands,[178] and then an *arctic* region as one approaches the North and South Poles that is characterized by sparse coniferous forest and especially tundra, where freezes are expected for a great deal of the year. Interesting things happen at the equator. It is a known fact, for instance, that a so-called "fictitious force" known as the *Coriolis force* can readily be witnessed at the equator, where water drains clockwise when on the the Southern Hemisphere side and counterclockwise on the Northern side. Interesting things regarding *geomagnetism*, or the magnetism of the Earth, also happen at the magnetic North and South Poles, as described by Bernard Brunhes, who suggested that the magnetic poles reverse. Proponents of the True Polar Wander Theory suggest that not only the equator, but the poles may shift physical position from time to time. This is distinct from the idea of *geomagnetic reversal*, which suggests that the magnetic poles shift, while the physical North and South axes remain in place. Charles Etienne Brasseur de Bourbourg had interpreted ancient Mesoamerican artifacts as pointing to such a cataclysm. Hugh Auchincloss Brown argued based on electrical engineering that that such a flip was caused by accumulations of ice. Meanwhile, and interestingly, Robert Gentry, a Creationist, supports his views upon the existence of radiohalos in disparate granite, suggesting that this implies that the Earth was created 6,000 years ago. If not Creation itself, perhaps this has implications for sort of solar activity.

Time throughout the Universe[179] seems to take the fundamental form of spirals, as even elipses must be when found in motion. From galaxies to the orbit of the Earth around the Sun and the Moon around the Earth, all taking place within a greater trajectory from the Big Bang, spirals show themselves to be the rule rather than the exception. Consider that time has been thought to be cyclical or circular by most of the ancients, while modern views on time tend to be linear, seeing the future as a vast and undefined openness into which we are perpetually heading, never repeating the past. A spiral view combines the two, putting the cycle into linear motion, much as occurs in Nature. This is not unlikely to have resulted from a fundamental interplay of entropic and syntropic tendencies, from which the clash of these is not unreasonable to expect a spiral to have arisen, as spirals often result from the interference or clash of two opposing forces.

The Earth

Geology, the study of the Earth, was explored by many ancient thinkers, such as Aristotle and Theophrastus, and then by philosophers such as Avicenna. It was later developed by a whole list of

[177] Irvin and Rutajit, 34
[178] Temperate climates have the most fluctuation of temperature, and so oscilate between hot and cold, providing more generality to the behaviors of the non-migrating species there, unlike around the poles and the equator.
[179] Psychological time

people.[180] Perhaps the origins of modern geology, however, have their home especially with the conflicts of the *Plutonists*, the people of volcanoes, and the *Neptunists*, the people of the water. Anton Moro, for instance, who had studied volcanic islands, argued that volcanoes formed the Earth through a long and gradual process. This gradualist, proto-uniformitarian view, would be called *Plutonism*. In reaction to this, Abraham Gottlob Werner pointed to the existence of basalt as distinct from volcanic rock, and suggested that the sea had been responsible for shaping the land. This catastrophist position would be called *Neptunism*.[181] James Hutton, a Plutonist opposed to Werner's Neptunism, is often credited as the originator of modern geology. He had believed that geological history can be referred from evidence within present-day rocks, which he believed to be evidence that the Earth was not young. Hutton believed the Earth to be alive. Werner's Neptunism was a religious outlook on geology, while Hutton's was based on natural history. Hutton believed that the continents went through periods of submersion beneath the waters, becoming dry land again.

Hutton would be responded to by Georges Cuvier, a paleontologist who believed, following the mythology, fossil evidence, and geologic knowledge of the Native Americans with whom he was in contact, as well as after his own investigations, that the Earth underwent a series of creations and extinctions that ended one set of *species*, or types of organisms, and started up others anew, completely independently from one another. Cuvier's Neptunism would be known as *catastrophism*, because of the belief that the world was shaped by catastrophic floods. This view would be challenged by Charles Lyell, a Plutonist who had argued that the Earth had been formed through the same processes that are in operation today, a position called *uniformitarianism*. Lyell believed that shifting continents could change the climate, such as temperature and moisture, but that these changes occurred only by way of forces currently operating. He used examples such as volcanoes, which he believed had been built up gradually, glacial action on rocks. He believed species would go extinct in conflicts between hybrids, giving way to new forms. The disputes about geology are ongoing. Institutionally-speaking, Cuvier has had his ideas relegated to the distant past, where they are used to explain deep time, while Lyell's views have been more generally accepted. Hutton's view, usually thrown in with uniformitarianism after Lyell's work, but which I will refer to as *sequentialism*, was that there were sequences that were at times met with *unconformities*, divisions between the sequences. Hutton had suggested that it was impossible to place a particular date on the *stratigraphy*, the various layers, of the Earth, but that it was nonetheless possible to know the sequence of events that had occurred. Strangely though, Hutton would be followed by the polarizing forces of Cuvier and Lyell, used to argue still today for specific dates, often diverging toward a Young or Old Earth view of geology. Cuvier focused on Hutton's unconformities

[180] Such as William Whiston, Nicolas Steno, Abraham Gottlob Werner, James Hutton, Georges Cuvier, Charles Lyell, William Buckland, Louis Agassiz, Georges-Louis Leclerc, Immanuel Kant, Jean-Andre Deluc, Horace-Benedict de Saussure, William Smith, Alexandre Brogniart, and Charles Darwin.

[181] These views are traced to even older, theological ones. Isaac La Peyrere had been an anticipant of the concept of *polygenism*, the idea that there were multiple sources of living things and people. He used his theory to explain the need for racism in the New World and to explain the source of Cain's wife, arguing thereby that the Earth was much older than the chronology of *The Bible* and that Cain's wife was sourced from pre-Adamites. Thomas Burnet, in turn, had argued that the Earth had been hollow, and that Noah's Flood had occurred through a rapid outburst from its depths, as known by the amount of water presently covering it not being able to account for its having had it upon its surface. Athanasius Kircher believed volcanoes to arise from a fire in the middle of the Earth that connected all of their chambers. William Whiston, the most material of them, had proposed that the Earth had been a comet that had passed through the tail of another comet, thereby deriving its water for the Flood, and that the creation account in *The Bible* included water prior to God's first act listed, such that the Earth already existed. Like Edmond Halley, he believed comets made a periodic appearance.

James Dwight Dana would later produce studies on volcanism, Mount Shasta, and mineralogy.

while Lyell focused on his sequences. This same sort of anti-dialectical "divide and conquer" strategy would be used later on in other fields of inquiry as well.[182]

Abraham Ortelius and Antonio Snider Pellegrini had noticed that Africa and South America fit together in terms of geography, and that they had likely drifted apart at some time in the ancient past. Roberto Mantovani held that a single continent had covered the surface of a much smaller Earth but that had been broken apart by way of volcanism. The idea that the continents of the Earth shift around or migrate is called *continental drift*. Early thinkers of continental drift believed the drift to have been caused by Noah's Flood. It would be developed further by Alfred Wegener, who named his modified version of Mantovani's supercontinent *Pangea*. Mantovani's view that the Earth was expanding and that the continent had covered its whole surface, however, was rejected by Wegener, who claimed institutional support. This better suited the uniformitarian position that Mantovani was disrupting. Wegener's position became the rule. The continental drift idea of Wegener had nonetheless been preceded by those of the expanding Earther Robert Mantovani, the politically-incorrect originator of the idea. Wegener, who was anticipated by Mantovani in his continental drift view, was aware of Mantovani but curiously did not mention his expanding Earth view. It seems there is a trend here, associated with a series of events like those surrounding Einstein and Mach or De Pretto, Heisenberg and Dirac.[183] Wegener would be followed by George Plafker's research on faultlines and subduction zones and by John Tuzo Wilson's claims that Hawaii resulted from a plate shifting over a hot spot. This view, the idea that the continents, or pieces of them, themselves rest atop *tectonic plates*— large sections of crust floating on the Earth— that move on top of the mantle as part of the rock cycle, causing the continents to move, would be called *plate tectonics*. Dinah L. Moche tells us that

> According to the theory of *plate tectonics*, also called the *continental drift theory*, continents and ocean floor are embedded in plates, or rock slabs, several thousand miles across. The plates move slowly on the slightly yielding mantle beneath. Earth's crust is reshaped at plate boundaries. Where the plates move apart, the continents separate slowly [...]
>
> Movement of the plates is also responsible for mountain building, earthquakes, and volcanic activity. These events occur at boundaries between the moving plates where they press on each other forcibly.
>
> [...]

---

[182] Particularly noticeable considering the attachments of the author and the content of this work is what would later occur with Mutualism or anarchism, which would slowly be divided according to individualistic and collectivistic currents, eventually diverging so far as not to be noticeably anarchist at all, except by way of rhetoric, in such forms as "anarcho"-capitalism and national "anarchism" on the Right and "anarcho"-communism and explicitly non-anarchist communitarianism[182] on the Left. This divergence from a more pure anarchism, Mutualism, took place through influences from outside of Mutualism, such as Marxism and Austrian economics, which championed one aspect of Mutualism to the defeat of another, Austrians maintaining the individualist side, now more sensibilist than oriented in Reason, and Marxists having taken to the socialist side. Anything in between is simply ignored, canceled, deplatformed, censored, or rejected before it can become a part of the public conversation. Such is an effort of *paradigmatic control*, control of the boundaries of what is allowed to even be considered. Much as names such as Cuvier and Lyell are acceptable canon in universities while Hutton is glossed over, Marx and Hayek are excuses to gloss over the contributions of Proudhon, as discussed later on.

[183] And others not explored here, such as Alexander Graham Bell and Antonio Meucci or Elisha Gray, or, perhaps more readily recognized, Thomas Edison and Nikola Tesla. The source of this trend will become more apparent.

> Our planet has a *magnetic field*, or region of magnetic forces, that affects compass needles.[184]

The Earth is composed of interstellar rocks, and some metals formed from within the Sun, and has been formed, at least in part, through mechanical pressures, fundamental forces, and thermodynamic processes. Its material goes through a process called the *rock cycle*. According to George Plafker's concept of *subduction*, rock from the Earth is pulled back down toward the core to be remelted and recycled up to the surface again, going from melting magma to solid crust as they cool. *Large low-shear-velocity provinces*, also known as *superswells* or *superplumes*, however, refer to assymetric masses that have been detected by seismic tomography in parts of the lower mantle surrounding the core, particularly under Africa and the Pacific, and may represent new (or else subducted) material. William Gilbert and Andre-Marie Ampere suggested that the Earth is a magnet, and Joseph Lamor said that it had a dynamo at the core that was generating a field by spinning, being followed in this by Walter Elsasser who placed the culprit instead at the surface.

The various geographic features, bodies of water, and landmasses have led geologists to question their origins. How did the mountains develop? The oceans? Continental drift was proposed as a solution to the otherwise popular idea that the Earth experienced periods of contraction, as was posed by Edward Suess, James Dwight Dana, and John Joly, among others. Eduard Suess believed the Earth was contracting. He had imagined a supercontinent called *Gondwanaland* from which the larger *Pangea* developed from continued accretion of the continents. Pangea theory proven by fossil evidence, such as the presence of the animals *Cynognathus*, *Mesosaurus*, and *Lystrosaurus* across the various continents as they were conjoined, as well as the presence of extinct plants such as *Glossopteris*. Others, such as Leopold Kober and Hans Stille would follow him in this idea. While the plate tectonicists took favorably to the idea that, for instance, India had crashed into Asia, causing the formation of the Himalayas; those who believed that the Earth underwent periods of contraction understood mountains to result from crumpling, resistance, bending of the crust, or etc. Expanding Earth theorists such as John Joly and Arthur Holmes also considered that an expanding Earth might experience cycles of contraction. Periodic heating of the Earth would cause growth, cracking of the Earth's crust, and contraction from the cold would cause crumpling and buckling, leading to various features such as canyons and mountains. John Joly suggested that the Earth not only contracted, but also underwent periods of expansion.

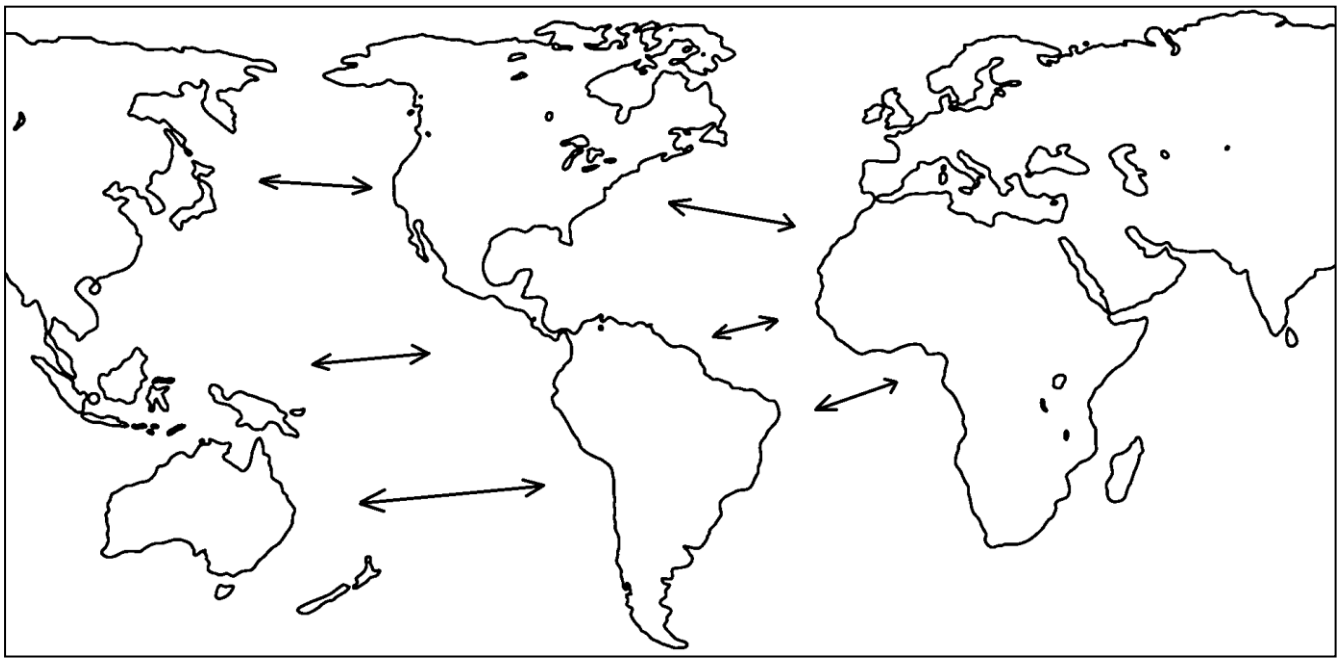
John Joly was an advocate of both an expanding and contracting Earth, and held in *A Surface-History of the Earth*, that the continents are composed primarily of a granite crust while the subsurface, including the ocean floors, are composed of basalt that shifts from a more solid to a more liquid state, and from this composition back. As such, he believed that water floated on top of the basalt the way that oil floats on water and that the granite floating on the basalt does so only by displacement of the basalt, such that when the basalt is more viscous the continents sink, and when it is more solid they become more buoyant. This is called *isostasy*. These sorts of theories involved *thermal cycles* in which radioactive decay contributed to the heat produced in the interior of the Earth. Joly stresses that all rocks are radioactive and, as such, a source of heat which is accumulating in the substratum of the Earth. He says that

> the structure of the Earth's surface revealed continents floating in a vast and universal layer of basaltic composition, both continental rocks and the basaltic magma being feebly radioactive. Where the substratum is uncovered the oceans rest upon its surface. We found that at the present time the substratum is in the solid

[184] Moche, 229

> state: and, as it cannot appreciably lose heat by conductivity through the continents [...] the radioactive heat continually evolved throughout its mass must accumulate in its entirety.[185]

Joly, while favoring an Expanding Earth, did not pose that the Earth actually gained in mass. Rather, he held that the Earth cycled in expansion and contraction from the buildup and release of heat produced by radiation in the rocks.



Others, such as Ivan Yarkovsky, Ott Christoph Hilgenberg, and Nikola Tesla focused their theories instead on the absorption of the aether by the Earth. Neal Adams has suggested that the Earth might have nuclear processes occurring in its core, but the mainstream view is that the heat within the core of the Earth is mainly a remnant from its formation and is not from an ongoing process of growth. According to Neal, whose version of geology is called the *Growing Earth*, the Earth is expanding from its core, generating material through a process called *pair production* that is the opposite of *annihilation* (wherein particle-antiparticle pairs cancel one another out, creating *photons* or light).[186, 187] According to this view, nuclear fusion processes from within the Earth, fueled by energy from the Sun accumulated at the poles of the Earth by way of the magnetic field, generate new material at the core, causing the Earth to expand over time and thereby causing the continents to drift apart from each other on all sides, much in the same way that the expansion of the Universe causes star systems to drift apart. There is some evidence for both the tectonic view and the Expanding Earth view, put together into a view called *Expanding Earth tectonics*, put forward by James Maxlow.

The Expanding Earth view is commonly rejected by the advocates of *uniformitarianism*, the view that the forces acting on the geologic processes of the Earth are constant and uniform, such that what can be

---

[185] Joly, 89

[186] Neal Adams has his suggestion that the Earth converts photons from the Sun during pair-production. Pascual Jordan had proposed that all planets expand, following after Paul Dirac's idea that gravitation changed. J. Marvin Herndon proposed in his *Whole-Earth Decompression Dynamics* that energy releasing from decompression after having been formed within a *gas giant*, like Jupiter, causes it to expand.

[187] It is worth mentioning that the Feynman-Stueckelberg and other such interpretations suggest that anti-matter travels from the future to cause annihilation

understood about the Earth in our present time should apply at all times in the Earth's history. Uniformitarians suggest that if the Earth is growing it should be picked up by instruments of today or otherwise be readily noticeable, but this assumes that the expansion of the Earth is constant and does not go through "phase transitions" of its own. If Earth does expand it is through syntropic processes, which come from an invisible source: the future. As such, it will appear "random" or "stochastic." Thus, we cannot know by way of induction of present phenomena, we must look at the record, and the record clearly indicates spreading at the sea's floor. This was shown by people such as Robert S. Dietz and Harry H. Hess after Bruce C. Heezen pointed out the oceanic ridges where new crust is being produced. *Subduction*, zones of crust being taken under in oceanic trenches, as is put forward by George Plafker and built upon by plate tectonicists, does have some examples in its favor, but is much less evident overall than is the seafloor spreading.

Uniformitarianism is in contrast to *catastrophism*,[188] the older view that the Earth has undergone a series of major catastrophes that has shaped the course of its history, as was championed by Georges Cuvier and as embraced by many religious people, including "Young Earth Creationists." Modern geology originated in the catastrophist view, and was originally seen as evidence of the Biblical account of Noah's Flood, or the Deluge, but this view was later seen as unscientific. Nonetheless, and especially when anthropological and archaeological evidence of widespread flood myths bridge across disparate cultures, it seems difficult to reject the possibility that major catastrophes do punctuate an otherwise undisturbed cycle of regular change. Most of these have been attributed to various phenomena such as asteroids, sunspots or solar flares, volcanic eruptions, and so on. Many of these may be described in the various mythologies of primitive and ancient peoples. And oral myths have found some scientific verification, as in the case of the Heiltsuk Nation, whose oral history from the Ice Ages was proven in court upon order of archaeological investigation by Alisha Gauvreau into the claim that their people had inhabited a place that had been resistant to freezing. This sort of evidence supporting mythology is simply too difficult to ignore.

The conflict between catastrophism and uniformitarianism may be something of a false dichotomy. Cosmological uniformitarianism, for instance, arguably allows for such things as phase transitions, wherein cosmological epochs occur from the unwrapping of the fundamental laws and their application to matter in a largely entropic fashion. This results from the cooling of the Universe. If uniformitarianism in cosmology allows for cosmological epochs that change the apparent symmetry of its operations, uniformitarianism in geology would seem to allow some room to admit for some catastrophe as the Great Year precedes, sunspots and solar flares occur, meteors and asteroids strike, and etc. Dynamic catastrophism seems to be an appropriate element of uniformitarianism, properly considered. If Neal Adams is correct, and mass is generated at the center of the Earth by way of pair-production, causing it to expand, then electromagnetic and quantum dynamics are at play, suggesting uncertain and probabilistic causation. But this would be due to the uniform laws of physics, much as a quantum fluctuation is.[189] Perhaps a case can be made that growth spurts in the Earth are not entirely enough to shake the uniformitarian position in the first place. Interestingly enough, Laszlo Egyed, who described the accepted phase transitions of the Earth that led to changes in the gravitational constant, was also a proponent of the view that it expands. Charles Darwin, a proponent of uniformitarianism, had also been an early proponent of an expanding Earth.

---

[188] This distinction was made by William Whewell

[189] Thinkers like Brian Greene describe the Universe coming into being by way of quantum fluctuations, and entertain interactions between *membranes* that exist in higher dimensions. Amit Goswami poses that the quantum field is pure possibility, and that from it anything can be derived.

The Expanding Earth seems to straddle a middle ground between uniformitarianism and catastrophism, and, when informed of the syntropy view, would become more powerful an explanation than either of them. The undisturbed periods of the Earth's development can be explained easily by the methods of uniformitarianism, while catastophism need not limit itself to astronomical causes alone, and can look to syntropy as the basis for catastrophe coming from within the Earth. Indeed, according to the pair production explanation of Growing Earth theory, it does exactly this. Because syntropy, which is ultimately the foundation of the Earth's growth, is not a physically-determined process, meaning that it cannot be effected from the past, its appearances will necessarily seem to occur irregularly. These kinds of irregularities in the growing pains of Earth could help to explain what Stephen Jay Gould had pointed out to be gaps in the fossil record that he explained as resulting from what he called "*punctuated equilibrium*," wherein species and morphologies disappear and new ones arise in their place in a process of *cladogenesis* or *morphogenesis*.[190]

Neal Adams suggests that there is some connection between the gigantism of the dinosaurs and the previously smaller size of the Earth. On a smaller Earth with less gravity from less mass, he reasons, species can grow much larger. Of course, the dinosaurs also benefitted from a much warmer climate and so participated in something of a worldwide climax system, too. But if Neal is correct about the effects of the Earth's size on the planet, and if John Joly and Arthur Holmes are correct about the Earth having also experienced periods of contraction— perhaps similar to James Dwight Dana's concept of *geophysical global cooling*—, then a smaller Earth (as well as being pocketed as if on an island in glacial valleys) might tend to produce gigantism.[191] The Earth's cycle of heat likely includes not only exposure to the Sun's heat from outside—*external forcing*—, but also the creation of heat from within the Earth in the process of pair-production, a *stochastic* or "random" process that we can never fully predict, going beyond that expected by Joly.

One concept coinciding with the idea of a contracting Earth is called the *geosyncline* theory, such as that of James Hall and James Dwight Dana and then of Leopold Kober and Han Stille, the latter of whom were believers in a shrinking or contracting Earth. This is the view that *synclines*, which are low points in stratigraphy that tend to collect sedimentation caused by erosion and runoff, become filled with that sedimentation and, when met with a contraction of the Earth, perhaps between riffs or even continents, this sediment compresses and raises from being squeezed out or perhaps even buckling upward, forming mountains. In this way, maritime fossils can be found on mountaintops. This explanation need not only function with a contracting Earth, however, as the swelling of continents might also cause compression in ravines, rifts, canyons, and between one another.

The periods of drastic cooling of the Earth are known as *ice ages*, or *thermal minimums*, while the intermittent and smaller periods of warmth are called *thermal maximums*. Ice ages, of which Earth has apparently had four, have *epicycles*, or cycles within the larger cycle, called *glacials* and *interglacials*, representing specifically cold and slightly warmer periods. Buckminster Fuller, in *Critical Path*, describes the occurrence of an ice age, saying that

---

[190] Punctuated equilibrium is based on a much older view that comes from the origins of paleontology and in the thought of the founding thinker and scientist, Georges Cuvier. Cuvier opposed the evolutionary thinking of people such as Jean-Baptiste Lamarck and Etienne Geoffrey Saint-Hilaire, suggesting that the fossil record indicates no sort of steady transition between species. Instead, Cuvier suggested that the fossil record shows drastic transitions wherein one set of species stops and another shows up. Early paleontologists and geologists taking after Cuvier would often compare the biological epochs with Days of Creation from *the Bible*.

[191] But only from lack of growth in the Earth, not from contraction, because contraction does not involve a change in mass

> As an ice age develops, more and more of the Earth's water is frozen, which greatly lowers the ocean level and reveals previously hidden, interconnecting land masses. At the time of the last ice age's occurrence the sea-hidden, interisland connections revealed themselves as continental isthamuses and peninsulas. The great islands of Java, Sumatra, Borneo, the Philippines, Sulawesi, and Bali became integral parts of the Malay Peninsula. New Guinea was part of continental Australia. Alaska and Siberia were connected.[192]

Indeed, a smaller Earth, correlating with cold temperatures, could also have contributed to this situation, wherein the *Sunda*, or Indo-Malaysia, *Sahul*, or Austro-New Guinea, and the Bering connections appear. A smaller Earth would condense these islands and peninsulas, making them into now-"sunken" and divided land masses. As the Earth cools and shrinks, populations that have sought refuge from the heat expand with the cooling temperatures from the North and from Tibet.[193] Mammals are known to have evolved around the North Pole, and to have spread as the planet cooled toward the equator, and as the dinosaurs were disappearing. As the Earth warms up, however, and grows in size, the expansion occurs from the equator, causing much mixing of populations, though less displacement.

Larry Vardiman, following the catastrophists, has suggested that the Ice Age was caused by Noah's Flood, saying that the whole Earth had not gone into an Ice Age, but that the Flood had allowed for enough water to snow heavily in the cold regions, which stored the water from the Flood in the glaciers, and that warm areas on the planet are actually necessary for the occurrence of an Ice Age.[194] Across the planet, human cultures have told of stories of great floods, seemingly from nowhere. While changes in the Earth's temperature and size likely account for some of this, another possibility is that the Earth cycles water in a way not entirely unlike magma, and that mass flooding may have sprung from the depths of the Earth, perhaps a number of times. One mechanism by which this may occur may be through *ringwoodite,*[195] a material found in the Earth's mantle. This element presently contains more water in it than the oceans do, in the mantle transition zone, as described by Schmandt, *et al.* in "Dehydration melting at the top of the lower mantle,"[196] and by Becky Oskin, in "Earth's Mantle Holds an Ocean's Worth of Water."[197] It is suspected that there is a water cycle that is very much like the rock cycle, wherein water cycles deep into the Earth's mantle, where it is compressed into ringwoodite, before coming back up. This material could have released water, pushing it up between the plates of the Earth, causing the Great Flood of myth and legend. Walter Brown, in "The Hebrew of Israel"'s "The Hydroplate Theory & The Ice Age," has posed what is called the *Hydroplate Theory*, the idea that seawater had burst from out of the Earth at the oceanic trenches, pushing the continents— which had all been together on all sides, with only inland seas existing, as on a supercontinent— apart, causing crumpling and buckling and the various features of the land seen today, while also ejecting matter into space, which come back down to us in the form of meteorites, sometimes containing water and bacteria in them. This event, he suggests, created coal deposits on the land, washing away canyon material, and being responsible for sea fossils on high mountains and various other fossils. The plates of the Earth, he suggests, resulted from cracking in the granite crust from this event. The Tibetan Plateau, it is suggested, is something of a hydraulic bubble itself, having apparently been shown to contain saltwater

beneath it.[198] Of course, many scientists today dismiss the idea of a worldwide flood during the time of humans at all. Joly, however, says that the Earth shows

> a record of periodic flooding of the continents, followed after long periods of time by retreat of the transgressional seas, and then by a great epoch of mountain-building and volcanism; succeeded finally by quiescence and such conditions as now prevail, wherein the land is above sea-level and the only surface activities are those of rain and rivers, frost and thaw. Thus a cycle is completed but only to be merged into a succeeding cycle in which the seas once more gradually steal in over the lower continental levels.[199]

Joly suggests that the Earth takes "some scores of millions of years," "about thirty-three million,"[200] for "these great cyclical events" to occur. Of course, many religionists and catastrophists disagree with this sort of "Old Earth" thinking, believing the Earth to be much younger and its development much more rapid. This sort of thinking often comes from inspiration derived from the reading of traditional mythologies, such as that of *The Bible* but also from cultures around the world, including Native American tales of the Earth having been established upon the back of a turtle, many of which tell of having experienced a number of cycles already, with each one referred to as a *creation of a new world*. Chan Thomas, for instance, in his *The Adam and Eve Story: The History of Cataclysms*, promotes the idea that a cataclysm occurs every 6,000 years. This is suggestive of an occurrence every quarter of the Great Year. These myths either have something important to share with us or they have learned how to hijack Nature for purposes of moving the spirit of mankind by a priestly class. But religionists are not alone in rejecting extremely old ages of the Earth. While, eventually Arthur Holmes' radioactive dating method would supercede Joly's prior estimates of radioactive decay and ocean salinity in the academy, Joly had remained skeptical of the late datings that radioactive methods produced. Harold Jeffreys and Charles Schucert remained opponents to the exceedingly long dates offered as well, demonstrating a resistance based on grounds of Scottish and American common sense echoing the original by Hutton.

Many would find their valleys flooded after the Earth warmed from the Ice Age, spilling waters from the melting claciers and the ice caps of the mountains into the valleys below, and freeing water for rains, submerging everyone and everything in their way. Other effects of the melting of the glaciers, perhaps similar to the flood that had caused them, included the sinking of islands and coastal areas after water was released from the thawing poles, wherein many fishing people or early maritime peoples, from whom later martime peoples would come, were greatly devastated.[201] This would be captured in many myths or legends from the time, across various parts of the world, perhaps being responsible for Noah's Flood rather than a prior, more disastrous event occurring before the Ice Age or even before the time of humanity, though perhaps happening as described by Walter Brown.

The Earth has clearly gone through a long series of changes since its inception. The earliest phases of the planet's natural history, in the mainstream models, are referred to as *Precambrian eons*. These include the *Hadeon Eon*, that which began at the planet's formation, the *Archaeon Eon*, which was a primarily water-covered world wherein life likely first started to develop, such as prokaryotes, eventually forming into stromatolites, or bacterial mats. The *Proterozoic Eon*, the last in the Precambrian Eons, would see the appearance of oxygen and eukaryotes. Itself being broken up into the

[200] Joly, 92

[201] There are many myths about this, including those surrounding the floods of Noah and Gilgamesh, or the islands of Atlantis, Mu, or even some renditions of Lemuria (which was originally proposed to have existed before the time of humans, to explain the spread of lemurs across continents)

Paleoproterozoic, Mesoproterozoic, and Neoproterozoic eras, the last of these, which had a period called the *Ediacaran*, produced some soft-bodied multicellular creatures or highly complex cell colonies. The *Cambrian Eons* would be composed entirely of the *Phanerozoic*, at least for now, as it is our current eon. These would be further broken up into various eras, periods, and epochs, all according to their stratigraphy. Arguments for these Precambrian eons often rely on conceptions of plate tectonics and the rock cycle, which are rejected by some fringe geologists.

The Earth is spoken of as having different spheres of function, which can be spoken of in terms of *geosphere*, *biosphere*, *zoosphere*, *noosphere*, *atmosphere*, and *magnetosphere*, themselves able to be broken up into various more specific spheres of operation. The surface of the Earth throughout its many pulsations— owing to added material such as by way of pair-production, rock and water cycles, plate dynamics, and warm and cold periods— has given way to a complex geographical arrangement, with six landmass continents: Africa, Eurasia, North and South America, Australia, and Antarctica. Between these are found the various features, such as oceans, seas, gulfs, bays, and straits, principally the Pacific, Atlantic, Indian, Southern, and Arctic Oceans and their derivatives, such as the North, Baltic, Mediteranean, Black, and Red Seas, or the Persian Gulf and Gulf of Omen. Water is also found on the land in swamps, creeks, rivers, lakes, and inland "seas," such as the Dead Sea and the Caspian Sea, or the Rhine, Volga, Danube, Nile, Tigris-Euphrates, Indus, Yangtze, or Yellow Rivers. Sometimes these rivers or other bodies of water may be associated with drainage basins, such as the various river valley basins or the Tarim Basin. Other times, land in the form of islands will be surrounded by vast waters. There are deserts such as the Sahara, Arabian, and the Gobi, and vast steppelands and plateaus such as those of Siberia, Mongolia, and Tibet or Arabia, Iran, and India. Large mountain ranges and hill zones are also prevalent, such as those of the Alps, Caucasus, Zagros, Ural, Altai, and Himalayas. Scrublands, grasslands, savannahs, forests, and jungles spring from the various soils of the planet.

On a smaller planet, the Balkans Peninsula may have been near to or connected to West Africa, the whole of Eurasia possibly having since been pulled Eastward and yanked the plate of the Arabian Peninsula away from Northeastern Africa in the Red Sea rift, which is made apparent by the Southernmost corner of Arabia fitting neatly (when seen with an elevation or physical map) into the top of the Great Rift Valley or East African Rift. India, at its origin, and if it is the case that Eurasia was pulled Eastward, may have had its West side butted up against the East of Arabia and *Sunda*—which is really just Malaysia and the islands of maritime Southeast Asia combined— would have also been butted up to the Eastern shores of India, perhaps separated from Africa by Peru and Equador in South America, which may have kissed the Horn of Africa. To the East of Sunda would have been the Northwestern coast of South America, while North America would border the Eastern coast of Asia up to the Bering Strait of Alaska and Yakutsk, or *Beringia*, which, like Sunda, did not have extra land mass, but instead was merely connected by way of compression. Howevever, there is good reason to think that India was instead butted up against East Africa. On the Eastern shores of South America, Brazil would fit under West Africa into Central and wrap its tip around South Africa, where it would meet Antarctica and, by way of Madagascar, the bottom tip of Australia. Antarctica may itself be the famed *Lemuria*, a proposed lost homeland of *primates*—animals such as tarsiers, lemurs, monkeys, apes, and humans— proposed by Philip Sclater and Ernst Haeckel, that stretched between Madagascar and maritime Southeast Asia. Central America would be joined by the Carribean Islands before wrapping up in the Gulf of Mexico and perhaps along the Northwest of South America some, though it was likely also have been in contact with the Iberian Peninsula, or Spain, from Europe, which was attached to West Africa as Iberomaurusia. *Doggerland*, which again, like Sunda, was not extra land so much as compressed plates, in this case connecting Britain with the mainland and Jutland, found itself pressed against the coast of Eastern North America. Greenland and the Islands of the Arctic would combine with the main body of

North America being met on its Eastern side perhaps by Scandinavia and by Siberia. Of course, it is possible that Eurasia was not pulled Eastward and that its current position is relatively true to its old one, in which case Iberia, Italy, the Balkans, and Anatolia would not be shifted as far Westward in this scenario, though would nonetheless still be connected to Africa, not changing the story drastically. Michael Bradley holds that the Red Sea and the Persian Gulf were originally just rivers that changed around the time of the Younger Dryas or so.[202]

Whether or not the planet Earth is a living entity is also a consideration within geology, although an uncommon one. Since primitive times, people have considered the Earth to be a living being with great importance, often personified as *Mother Earth* or the *Earth Goddess*. This idea would be repopularized in modern geology by way of people such as James Lovelock and Lynn Marguilis. James Lovelock's Gaia hypothesis says that the Earth maintains a homoeostasis, similar to a living organism. In response to criticism, and in order to demonstrate the idea, Lovelock created a computer simulation called *Daisyworld*, wherein daisy phenotypes responded to the amount of solar radiation they were exposed to, with black ones proliferating when temperatures were low (in order to better absorb) and white ones when they were high (in order to reflect), with the effects of this regulating the overall stability of the climate. Unfortunately, Lovelock would later become a climate fearmongerer, counter to this concept. They had been anticipated to some extent by thinkers such as James Hutton, Alexander von Humbolt, Vladimir Vernadsky (who understood *life* to be the geological force that shapes the planet), and Aldo Leopold (author of "The Land Ethic"). The pantheist John Toland, in his *Pantheisticon*, states an even earlier view of a living Earth, when he says that

> In Stones and Metals we may behold sundry Shapes of Veins, such as the Shoots, as it were of Branches and Roots, spread far and wide, which they have in their Mines and Quarries; from whence, (to appropriate to myself the Words of a certain Philosopher) a friendly Ailment gently filtrates, first through Passages more lax, afterwards gradually through more narrow ones, to refine and make pure the Nutriment and finally, an Exhalation passes through thin and hidden Pores.
>
> [...]
>
> As growing Trees and Trees hewed down differ, so Stones in Quarries, and Stones hewed out of them: Those are alive, and these are dead; those in their native Beds are full of Sap, these torn asunder are destitute of Moisture, and at length are reduced to Dust. In a Word, every Thing in the Earth is organic, and there is no equivocal Generation, or without its own Seed, of any Thing in Nature. Wherefore it is not without Reason, that the Earth should receive the Appellation of Mother.[203]

If the *Law of Biogenesis*, that life only comes from life, put forward by Louis Pasteur, is correct, and if life has its place of origin in the Earth, perhaps in *black smokers*— or volcanic oceanic vents wherein the most primitive forms of life have been found— or even through the proposed *RNA world*— wherein life starts from RNA—, then the necessary conclusion must be that Earth is, in some sense, alive itself. And, if this logic continues, the Universe, too.[204] John Toland was not alone in recognizing biological

---

[202] See Bradley[1]

[203] Toland[1], 33

[204] Nonetheless, because the source of life for the organism, classically understood, is not in the past, but in the future, as per syntropy, and because humans can not change the past, humans will never have agency to give original life, only to pass it along. This is why the Law of Biogenesis persists and cannot be challenged. While the Miller-Urey experiment and those that followed can succeed in growing proteins, these proteins are sourced in amino acids that have not been spontaneously generated in a laboratory. The clay called *montmorillonite* produces lipid- or fat-like structures that have RNA in them, but RNA and even complex proteins do not count for biological life classically considered (having a complex of characteristics such as metabolism, fecundity, response

characteristics in geology. Long before, Aristotle held to *Petrifaction Theory*, the idea that many rocks are the remains of living things that had turned to stone. Much closer to our own time, Otto Hahn argued that many meteorites and rocks had organic origins similar to coral, and Randolph Kirkpatrick put forward the argument that basically the entire crust of the Earth had biotic origins. Kirkpatrick, in his *The Nummulosphere: An Account of the Organic Origin of So-Called Igneous Rocks and Abyssal Red Clays*, argued the most extreme Petrifaction Theory, to an unconvinced audience, that the crust is composed of mineralized organic remains, the most primitive of which he believed to be the *nummulites*, which are *benthic*, or "sea-floor sitting" (as opposed to *planktonic*, or "floating") *foraminifera*, protists (eukaryotes) that form shells. However, today, it is known that there are other extremophiles that live in the black smokers, where the *foraminifera* cannot survive. Recently, thanks to the team aboard the RV Atlantis vessel, it has been discovered that there are structures distinct from the black smokers at the sea floor trenches, such as the Lost City Hydrothermal Field, which is not as hot as the volcanic black smokers, but has other processes that may be conducive to early life-formation. These, instead, function on chemical reactions between the sea water and mantle rocks, leading to *serpentization*, a process that produces methane and hydrogen, and, as such, is considered to contribute to the development of simple organisms important to studies on the origin of life, particularly microbial mats that have been found there. This simple system has garnered interest also from astrobiologists looking for extraterrestrial life on other planets.

Astronomy and geology may seem boring and unnecessary outside of a given field of expertise, but the uses of them can be highly political. In the ancient times, priest-kings, declaring themselves connected in various ways to the Sun as a deity on Earth, would impress their people by predicting natural phenomena such as eclipses, attributing them to their own power, making the liar seem larger than life. Using their knowledge of natural forces, priestly chieftains and kings would plan strategic efforts of warfare, as can be inferred from passages in *The Bible*, as from the plagues of Moses.[205] The Zodiac and astrotheology became a chief means of tracking the changes in the climate and culture, and of logging historical data, becoming something of a culture-wide *mind palace*, a memory device as is used in the "Art of Memory." So why might the Expanding Earth theory be something that should go unconsidered by the public, even distracted from (by medievalist premodern nonsense about a Flat Earth or postmodern nonsense about a Hollow Earth, and thereby establishing associations in the public mind[206] of those who question the absoluteness of plate tectonics with lunatics who deny science)? I don't believe this to be an accidental occurrence. Geology faced repression around the same time that cosmology and the other sciences did,[207] around the time of the World Wars and that which followed.

---

to stimuli, cellular structure, etc.). Of course, so far as we consider the Universe itself alive, some element of animism is likely to creep into the picture, such that: of course they are alive! But scientists have been unable to take this basic animating force that persists in everything on some level and develop it into an organism, no matter how hard they try. This requires something that scientists, like all of us bound to a psychological arrow of time, have no agency in, retrocausality.

[205] Thales, the Greek philosopher, is said to have bought up all of the olive presses one year, and to have made a killing in the market when he predicted correctly that it would be a particularly bountiful harvest

Life on Earth

Life seems to have appeared first in the form of a single-celled organism. The manner in which this occurred is up to much debate, and many proposals have been made as a solution to the problem. These range from belief in an intelligent designer who imbued life into the Universe, to *abiogenesis*—which poses that life occurred by accident or chance or by some duplicable process here on Earth—, and on to *panspermia*, the idea that life on Earth came from elsewhere in the solar system or even galaxy. It appears to me that none of these meet the criteria of *Occam's razor*, which suggests that the simplest explanation that takes into account the data is the most likely to be true.

Whatever the case may be, mainstream scientists tend to envision the context in which life originated to have been quite different, very harsh, such that, as Morton Jenkins says, in *Teach Yourself Evolution*, "it is assumed that the first atmosphere was a mixture of ammonia, water and methane,"[208] following the thought of Alexander Ivanovich Oparin.[209] By this view, most commonly accepted in the mainstream of science,

> The Earth, the third planet from the Sun in our solar system, was a lifeless sphere of matter covered with a thin layer of swirling gases. At first its surface was molten and volcanic but in time it began to cool and solidify. No life was there to be startled by the piercing creeks and rumbles of the groaning, contracting and expanding rocks. Dense murky clouds reflected the fiery volcanic eruptions and thunderous lightning storms pierced the sky continuously for millions of years. Condensed water vapor filled the oceans. It would seem most inhospitable as the birthplace of life.[210]

This sort of thinking, Jenkins points out, led Harold Clayton Urey and Stanley Lloyd Miller to perform their Miller-Urey experiment, which was ultimately unsuccessful in recreating life. The problem that was to be resolved was how ammonia, water, and methane, combined with lightning, sunlight, heat from both the Sun and the rapidly cooling Earth, kinetic energy, and time could result in the creation of living things. The experiment involved a duplication of some of these conditions and apparently resulted in the production of two amino acids, glycine and alanine. Jenkins says that

> Miller's experiment was only the beginning. Other scientists repeated it and obtained similar results. By 1968, every known amino acid had been formed in such expiriments—but, of course, these were a long way away from anything resembling life.[211]

Famous expiriments such as the Miller-Urey have tried to demonstrate that life can come from non-life, and have been used to argue for concepts such as the *RNA world*—that life began with RNA, as might be found in montmorillonite clay—, but with no ultimate success, as they have always required living material for their findings to have taken place. Jenkins points out a number of other efforts to improve upon the Miller-Urey experiment, showing that more compounds, including the beginnings of nucleic acids—nucleotids—, could be created. He, however, feels the need to close out his chapter with discussion of Jeffrey Bada and Luanne Baker's discovery of *Buckyballs*, carbon molecules that are claimed to be sourced from outside of the solar system. Buckyballs would be used as a basis for arguments from panspermia. It seems clear from another of Jenkins's comments that Buckyballs would

[208] Jenkins, 34
[209] Note the name *Ivanov*ich, as this name might suggest connections to elite families
[210] Jenkins, 34
[211] Jenkins, 37

become a necessary escape route for substance-materialists,[212] because they have been unable to explain the biochemical causes of life, including ATP, the "currency of the cell." He says,

> The external supply of energy to the chemical mixtures of early Earth could be explained in physical terms, but the internal energy required for activities in living things must be supplied chemically.
>
> There are certain chemicals in living organisms which, when broken, will release energy. The energy then becomes available for living processes. Without such chemical energy, life as we know it would be impossible no matter how many proteins or nucleic acids existed. The best-known energy-rich compound is one called *adenosine triphosphate* or *ATP*.[213]

ATP, discovered by Karl Lohmann and others, is found in all organisms, and is used for intracellular transference of energy. Plants, for instance, create ATP in the light-dependent process of photosynthesis. The big question for substance-materialists seems to be what gives impetus to, or performs, the "breaking" function in the ATP. The source of this function has been traced through to what chemists used to call *affinity*, the "force" causing chemical reactions. Today, this is known as Josiah Willard Gibbs' *free energy* or as *thermodynamic free energy*. It is "free" energy because it appears independent of physical causation, being able to "fire off" without external pressures. Indeed, it was this "free energy" that led Erwin Schrodinger to write his book *What is Life?* and to develop the concept of *negative entropy* or *negentropy*, a concept related closely to, and sometimes considered to be the same as, syntropy, and which Leon Brillouin associated with information (which decreased uncertainty), though at an entropic expense. The energy appears to be "free" because its causal source is in the future and not the past. This is similar to how people appear to have a "free" will, while they are really determined to act by their goals.

Louis Pasteur, father of pasteurization, demonstrated quite well that life cannot come from non-life, at least not in any duplicable process (and depending on the working definition for *life*). Pasteur's *Law of Biogenesis*—that life only comes from life— stands strong and unchallenged by the Miller-Urey expiriments. No one has been able to show this law is inoperative under any conditions. Humanity cannot create life from inorganic material. It simply cannot be done. Pasteur's process, known today as *pasteurization*, is still practiced in the food industry, and the *Law of Biogenesis*—that life only comes from life— still remains rather unchallenged. If we want to create life today, we must do so through breeding or cloning.

Panspermia, like the more ridiculous *ancient astronaut theory*— which poses that life or human evolution is owed to space aliens—, has the problem of simply creating more distance between ourselves and the answer, by posing that life didn't originate on Earth, but elsewhere. Much as with the question of where a transcendent, supernatural God came from, we are left to ask where the aliens came from. Nonetheless, it is not impossible, and not as implausible as the completely unnecessary ancient astronaut nonsense, perhaps even having contributed to some Earthly admixture. But is it a necessary explanation, or does syntropy provide an easier answer that doesn't simply move the goalposts?

---

[212] As opposed to attribute-materialists, of which the author is of the persuasion, which holds that matter is an attribute of an underlying Substance. Substance-materialists are of the belief that matter is all that exists, while attribute-materialists hold that matter exists, but that mind exists also and, in a relative way, distinctly.
[213] Jenkins, 40

Intelligent design, such as that promoted by Stephen Meyer,[214] poses that the complexity of life is such that it required an intelligent force to design it and put it together. While maintaining some compelling arguments, intelligent design theorists are quick to imply that the intelligent force is coming from outside of the Universe. This tends to have a religious or theological feel to it that comes up to the same problems as panspermia and ancient astronoaut ideas. If that answers where life came from, where did the equivalent in God come from? Perhaps this can be answered with God's eternal existence, but how does this supernatural force, which is separate from nature, interact with it, without doing so within nature? Everything that is natural is causally tied through cause and effect, so if God can affect things, what makes God unnatural or supernatural? This is known as the *mind-body problem* and was resolved by the pantheist Baruch Spinoza, who suggested that God *is* Nature, and that the natural world of matter and physics was united through a singular Substance (God/Nature), that not only the physical and bodily world is natural, but so too the psychical and mental or spiritual world. In this way, the intelligent designer is brought back into the fold of Nature, being Nature itself. This is often called *neutral monism* or *dialectical monism*, though other related terms and renditions of dualistic or semi-dualistic monism[215] also exist.

All things considered, it is most likely that life (or at least RNA)—as suggested by Gunter Wachtershauser and others— first appeared on the Earth in hydrothermal vents on the ocean's floor, called *black* or *white smokers*, by processes we will never fully understand in the way of a hard or physical science. These vents are found near locations where the seafloor is spreading, where Growing Earthers suggest that new rock is created and where there is overall consensus that some sort of discharge of material is coming from, however fresh or cycled it may be. Interestingly, this is also a formation point of serpentine rock, which will be mentioned later and is found at the vents. So long as the Earth is understood as having some elementary quality of life within it the law of biogenesis is not infringed by this view, which also need not assume life on Earth as having come from where it has not been found to be indigenous. These kinds of ideas have led thinkers such as Thomas Gold to propose *abiotic*, or non-living, origins for petroleum, posing that its origins come from within the planet.

The *shadow biosphere* is the concept that life may have had multiple origins, even on planet Earth alone, and that lifeforms from different sources may ultimately coexist in a parallel format. It has been promoted by people such as Paul Davies. Carol E. Cleland, for instance, in "Epistemological issues in the study of microbial life: alternative terran biospheres?" writes that if "the emergence of life is, like other natural phenomena, highly probable given the right chemical and physical conditions then it seems likely that the early Earth hosted multiple origins of life, some of which produced chemical variations on life as we know it."[216] The author points out that this basic premise has often been accepted, but that nonetheless it is asserted, without due evidence, that the organisms of different origins died off, which the author contends may not be the case. In fact, we may be a composite of these organisms, which have since merged.

However life first appeared in its form as a single-celled creature— from amino and nucleic acids and so on—, it had to reproduce itself. This occurred first *asexually*, by way of self-duplication, and then involved *horizontal* or *lateral gene-transfers*, the passing of genes from one organism to another, to provide adaptive variety. After sharing genes by way of horizontal gene transfers, and in eukaryotes[217],

[214] And perhaps best anticipated in Greek and Christian philosophy, Newtonian and Cartesian thought, but especially in William Paley's watchmaker analogy
[215] *Monism* is the view that "All is One"
[216] Cleland
[217] Single-celled organisms distinct from *prokaryotes* (organisms that lack cell nuclei, like bacteria), like protozoa

sexual reproduction[218] and the forming of multicellular organisms gave way to *ediacaran biota*— generally non-locomotive organisms of an early period— and then plants and animals after that. At first this involved hermaphroditism[219] before tending to *sexual dimorphism*, different forms for males and females, as can be found in both plants and animals.

Sexual reproduction is something of a biological investment. In a certain sense, it is very costly, because it often involves expensive displays and advertent signaling such as colorful plumage, mating calls, or even status shows involving mortal combat, which, if not for the benefits of sexual reproduction, tend to cause deselection for the species through increased predation and conflict. It also involves the transfer of fluids, which can spread diseases. But sexual reproduction offers many benefits to a species stemming from its allowing for the exchange of favorable genes, and therefore adaptability, as well as variation, which greatly accelerates evolution and provides for resilience. Whereas asexual reproduction—aside from horizontal gene transfer— basically produces clones, sexual reproduction allows for a mixture of genes to be found within a given population of organisms, such that—combined with the skipping of genetic expression between generations—parents may be very different even from their offspring (as well as their own parents). Among certain higher orders of social mammals, such as Bonobo Chimpanzees, dolphins, and humans, sexuality is also a means of pair-bonding and even friendship or alliance-building.

Sexual reproduction, or *fecundity*, "replicability," is likely the most important behavioral driver for sexual organisms, perhaps second to staying alive (typically just long enough to replicate). It is by way of sex that one's genes, copies of oneself, are passed along, that *they* stay alive. Sexual species, were they not driven by sex, would cease to survive, because they would stop replicating themselves. Many organisms stay alive just long enough to reproduce sexually, as with the famed black widow spider or praying mantis. Organisms are often willing to risk their lives in order to have sex.

Evolution is the process by which organisms change from one form to another, and is responsible for the increasing complexity found in the fossil record and in biological taxonomy. The process of evolution is often understood to occur by way of natural selection. *Natural selection* is the "choice" made by environments about which creatures are not "fit" for survival into the future.[220] Those animals that fit well into their environment, and fill a niche for which they are well-suited, survive. Others do not. The mechanism of natural selection was described first *in detail* by Alfred Russel Wallace and by Charles Darwin, and was explored in great detail in Darwin's *On the Origin of Species*.[221]

Before Darwin and Wallace, however, evolution had been described as a "transmutation of species" guided teleologically by God, such as in *Vestiges of the Natural History of Creation* by Robert Chambers (or in the thought of thinkers like William Paley). Teleological concepts have occurred since the conception of biology by Aristotle, who described living things as being caused by finality. Chambers's book was known to Darwin and Wallace, and Wallace looked upon it, which had convinced him of the "transmutation of species," with favor. Hans Driesch would conceive of the concept of *entelechy*, meaning a self-contained purpose. Even today, teleological notions in biology persist, as in Colin Pittendrigh's concept of *teleonomy*, or in the work of Thomas Nagel.

---

[218] Whereby genes were transferred in a sexual manner. This can occur directly, as with sexual intercourse, or it can happen indirectly, even being facilitated by another, as with some plants, which have their pollen transported from stamen to pistil by insects such as bees

[219] One individual of both sexes

[220] It might be more appropriate to speak in terms of natural *de*selection, because the mechanism is "efficient causation" and so based in entropy, which can be a force for deselection but not for selection.

[221] Others, such as Herbert Spencer, had already made use of the idea that organisms evolve through the selection of traits

Jean-Baptiste Lamarck had another approach to evolution. Sometimes considered teleological, despite his materialism, Lamarck believed in a process of evolution whereby traits were acquired through use and inheritance. In his view, then, the length of the giraffe's neck had been inherited from creatures whom had previously struggled to browse for high foliage, but nonetheless tried and exercised their ability, resulting in longer necks, passed along to offspring. For Lamarck, evolution occurred through the exercise of will, and was not simply a physical process, but a process of the mind, or spirit. In Lamarckism, changes of mindset and will are passed down to the offspring.

Neither Lamarckian idealism nor Darwinist materialism is wholly correct or incorrect, but both are rather complementary forms of evolution that occur on different scales. That is, Darwinist natural selection occurs on the scale of the organism, while Lamarckian acquisition of traits occurs on the scale of family, culture, or society. Cultural and societal selection deal most with learned behavior, while other forms of selection tend to deal with forms and limits of physical being. As Patrick Nolan and Gerhard Lenski point out, in *Human Societies: An Introduction to Macrosociology*,

> both types of evolution are based on records of experience that are preserved and transmitted from generation to generation in the form of coded systems of information. In the case of biological evolution, the record of experience is preserved and transmitted by means of the genetic code. In sociocultural evolution, the record is preserved and transmitted by means of symbol-systems. Both the genetic 'alphabet' and symbol systems provide populations with the means of acquiring, storing, transmitting, and using enormous amounts of information on which their welfare and, ultimately, their survival depend. Thus, symbol systems are functional equivalents of the genetic alphabet.[222]

They say,

> In the cultural world, however, a kind of Lamarckian evolution does occur. Just about anything that a population learns and considers worth preserving can be incorporated into its cultural heritage.
>
> [...]
>
> Moreover, sociocultural evolution does not require that every society go through step-by-step sequential stages of development, as in biological evolution. Rather, a society may compress or even skip stages.[223]

Herbert Spencer's *Social Statics* built on both Chambers's and Lamarck's ideas, along with others' such as Erasmus Darwin, Charles's grandfather. Spencer anticipated the natural selection idea.[224] While, etymologically, *evolution* refers to an unfolding, and so in that sense might be likened to entropy, Darwin did not like the term because it implied a sense of progress that he did not adhere to in his work. *Evolution* might also be related to the concept of *development*. Despite Darwin's reservation about it, the term was popularized by his predecessor, Herbert Spencer. Progress and development, rather than entropy, imply syntropy. This being the case, *volution* more simply, not "unfolding" but "folding," may better describe the teleological force that Spencer called *evolution* in his following of the thought of Robert Chambers. Chambers, himself, was considering the natural history of animal life in

[222] Nolan and Lenski, 60
[223] Nolan and Lenski, 61
[224] William Charles Wells had made a statement of natural selection decades before Herbert Spencer had, using it to explain differences in skin colors among humans. Edward Blyth and Patrick Matthew would also make early statements regarding natural selection. James Hutton had made a less thorough implication to it as well. Spencer's was, however, more thorough and focused.

terms of recent considerations of cosmic evolution. What he and Spencer both failed to recognize, however, was that the thermodynamic processes of life run counter to those of relative non-life. Nonetheless, for now the term *evolution* will be used colloquially with the caveat that what is really being implied is *volution*.

Looking back at matters, it appears a familiar pattern reemerges. Robert Chambers had made a major impact with his *Vestiges of the Natural History of Creation*, causing much controversy and fueling much radicalism. Herbert Spencer's *Social Statics* was ever more fresh, and continued with the project of Chambers. Both were political radicals. Enter Charles Darwin, a friend of Lyell's, and Richard Owen, a follower of Cuvier's. Richard Owen was a religious Creationist who later tended tolerated a more Lamarckian sort of view, also tinged with what I might called *morbidism* or *abnormalism*, the idea that morbidities or abnormalities such as birth defects, virgin births, and developmental irregularities like early births or late development might contribute toward evolution. In some ways, Owen's ideas were similar to those who had continued to argue for a degenerative theory of the human race, such as those of Georges-Louis LeClerc de Buffon and Johann Blumenbach, who had argued that the human race was not progressing, but in fact degenerating over time, an idea that had also influenced Cuvier, himself an influence on Owen. In opposition to "Darwin's bulldog," Thomas Huxley, who had argued that the difference between an *Indo-Eurafricanoid*, or white European, and a *Capoid*, or South African, were similar to the difference in range between a Capoid and an Orangutan, Owen denied, to the other extreme and inconsistent with LeClerc and Blumenbach before him, that there was no difference at all between the brain capacities of the human races. Similar to the job done by Cuvier and Lyell on James Hutton, wherein Lyell came out on top, Darwin would come out over Owen to the neglect of Chambers and Spencer. Lamarck's views had been considered discredited, and Darwin's view won out with the establishment.

The *Modern synthesis*, eventually established by Ronald Fisher and others, combines Darwin's natural selection with the genetic model popularized by Gregor Mendel. More teleological[225] and Lamarckian views were more-or-less disincluded and swept under the rug. Lamarckian views do seem to line up with some notions in epigenetics, forces in sexual and social selection, and socio-cultural evolution, such that there has or had been revived interest in Lamarck in recent decades, however. According to the standard model, basic natural selection operates like this: An environmental *niche* opens up, meaning that there is an opening, such as a role, that can be filled by an organism. Species that fill such a niche adapt to the niche,[226] such that physical or behavioral changes— due to mutations or *genetic drift*, the sorting out of mutations— occur, allowing the organism or community of organisms a better chance of survival in the niche. Those organisms that survive and reproduce—those with favorable

[225] Darwin's view is teleological in outcome, though his mechanism is from efficient causation.

[226] Adaptations occur through a process of mutation and natural selection, wherein changes to genetics, called *mutations* (that likely arise from the quantum field by way of the hydrogen bridge) are put up to the "trial by fire"— or selection— of Nature. Those mutations that survive a given environment and help to successfully fill a niche tend to be passed along, while others are filtered out of existence by natural deselection. We can see such niches being filled when a major change, or disturbance, occurs in the environment and ecological succession takes place.

Similar to biological evolution, cultural evolution occurs through the cultural equivalent of natural selection, but instead of genes, uses memes. The concept of *meme* was presented in Richard Dawkins's *The Selfish Gene*. Memes are idea-packages, or concepts, that are passed around through culture, including those that become realized in material technology. Memes, like genes, are put to the test of natural selection, though within the framework, expectations, and pressures of human societies. Human societies make choices and create technologies which, in return, affect us. This occurs in what is called a *feedback loop*.

mutations— are understood to be naturally selected. For an instance of this in operation, Morton Jenkins tells us that

> The sudden appearance of tropical forests in North America showed a rapid warming of the climate, and this was followed by the spread of temperate woodland, dominated by conifers as the climate cooled. Animals, such as the dinosaurs, that had evolved to live under the stable conditions during the previous hundred million years, could not have tolerated changes like this and subsequently would have perished.
>
> With the extinction of the dinosaurs and other large dominant reptiles, the mammals and the birds spread and occupied the niches that had been vacated. Within a few million years the forests that had been browsed, seas that had been fished, and insects that had been preyed on by reptiles were being browsed, fished and hunted primarily by mammals and birds.[227]

Jenkins says,

> Just as Nature abhors a vacuum, evolution abhors an empty niche. Thus, many large flightless birds occupied the ecological niche vacated by the dinosaurs and other terrestrial predators when they suddenly became extinct. Birds of gigantic proportions roamed the continents.[228]

Biologists generally follow a gene-centered view of evolution, whereby genes are selected according to their ability to continue in the long term, as described by Richard Dawkins. Genetic selfishness, or genetic self-preference, does not always entail *narcissism*, the placing of oneself greatly above others, but has actually been used to explain the high orders of cooperation among social organisms. The *eusociality*, or mating-socialism, of the *Hymenoptera* (ants, bees, termites, etc.), for instance, can be explained through this view by means of a process called *kin selection*, the selection of kin which will breed on the group's behalf. Genetic selfishness suggests that organisms with similar genetics are more likely to cooperate, because selfishness does not lie on the level of the organism, but on the level of the genes; evolution does not attempt to preserve individuals, but genes, and, when culture exists, memes. Dawkins says, in a *New York Times* interview, "[i]t's not the selfish individual, and certainly not the selfish species." He then continues, "[m]y book could have just as easily been called 'The Altruistic Individual.'"[229] Clearly, if genetic selfishness can lead to superorganisms, such as highly ordered ant societies, altruism on the level of the organism is clearly not outside of the picture.

Clearly, altruism[230] is an expression of our genetic selfishness, but Dawkins is commonly pigeonholed as having a narcissistic view of reality, though he has challenged this view, as above, on multiple occasions. Herbert Spencer, the great sociologist and libertarian thinker, had been subject to similar accusations to Dawkins, but long before. After all, he is one of the fathers of "social Darwinism." He has been pigeonholed time and time again as a brilliant, but morally atrocious thinker. Joshua Crosby, in "History of Cultural Anthropology and Theory," for instance, has no difficulty putting it this way, suggesting that "if there is a villain in this story [of cultural anthropology] it would be Herbert Spencer,"[231] basically counterposing the entire field of cultural anthropology, the study of human

[229] Dawkins[1]
[230] Really, what is called *reciprocal altruism*, giving behaviors that are well-adapted and that generally benefit the species because the sharing may be reciprocated
[231] Crosby[1]

cultures, against the efforts of Herbert Spencer.[232] As Peter Richards points out, however, in "Herbert Spencer: Social Darwinist or Libertarian Prophet?"

> The most frequently quoted passage of Spencer's work, by Hofstadter and others wishing to smear Spencer's reputation, is "If they are sufficiently complete to live, they do live, and it is well they should live. If they are not sufficiently complete to live, they die, and it is best they should die." This does sound harsh, but what the Spencer-knockers fail to quote is the first sentence of the very next paragraph, which transforms its meaning: "Of course, in so far as the severity of this process is mitigated by the spontaneous sympathy of men for each other, it is proper that it should be mitigated."[233]

Mutual aid, empathy, sympathy, is clearly an evolutionary development of our own genetic selfishness, and has been selected in through a long process of evolution. Selfishness on a genetic level does not entail a lack of altruism on the level of the organism, but, in fact, implies the opposite teleological tendency; *reciprocal altruism*, giving in hopes of being given back to, in the long term, will be selected in.

According to the Modern synthesis, genetic inheritance is relayed by way of nucleic acids such as RNA and DNA, which contain the genetic structures. *RNA*, or ribonucleic acid, are macromolecules that are assembled into a chain, some of which are involved in the sequencing of proteins and in interactions with the DNA, especially translating the DNA in the synthesis of proteins, though other roles are certainly also performed. Along with DNA, it was originally discovered by Friedrich Miescher, who had examined pus under a microscope, finding nucleic acids in the nuclei of the cells. Like RNA, *DNA* refers to deoxyribonucleic acid, a polymer molecule that is associated with genetic information. Nucleic acids were explored further by many others.[234] James Watson and Francis Crick made the most famed impact, providing the basis for our present understanding of DNA. *Photo 51*, taken by Raymond Gosling, provided the suggestion that DNA was formed as a double helix. The photo appears electromagnetic or cymatic (sound patterning) in nature, but Frick had previously written a paper about the diffraction pattern of double helixes and Watson seemed to have spotted a match. This photo had been used by Watson and Crick without the prior knowledge of Rosalind Franklin, who had put the photo aside to examine another photo instead, having named two types of DNA between them, *A* and *B*. Some argue for foul play on behalf of Watson and Crick regarding the merits of Franklin, who was more interested in the photo of DNA-A. DNA-B, from now on just *DNA* as is used widely in popular culture, is understood to be responsible for the major genetic coding of the organism, being connected to the various traits that are expressed in the creature. It is composed of sex chromosomes and autosomes of the cell nucleus as well as circular mitochondrial DNA found in the *mitochondria*, the "powerhouse of the cell," providing ATP for chemical energy.

The sex chromosomes in humans include the X and Y forms, and come in a single pair, being either *heterogametic* or *homogametic* matches, meaning "different" or "same." Not all animals are sexed according to their X and Y chromosomes, however. Birds and some reptiles (such as boas and pythons), for instance, have a W and Z chromosome instead of a Y and X. In humans, X DNA is provided by the mother to each of her male and female offspring, and from the father to his daughters as well. The

[232] He paints a picture of Herbert Spencer, a Ricardian socialist, as a brutalistic capitalist that had no concern for others, while Spencer's actual philosophy of social evolution developed to explain how people become more morally-suited for living in a social environment

[233] Richards

[234] Such as Albrecht Kossel, Phoebus Levene, Nikolai Koltsov, Frederick Griffith, Jean Brachet, Severa Ochoa, William Asbury, Oswald Avery, Erwin Chargaff, and many others

pairing of X chromosomes from a mother and a father coincides with female offspring, such that XX is the sex chromosome pair for a biological female. The X chromosome that a human inherits from one's mother, as a result, can be entirely composed of her own mother's X chromosome, entirely from her father's, or, more likely, a mixture resulting from *recombination*, or blending, of the genes of the grandparents. Males are generally weak carriers of X DNA, and generally X DNA is lost within two generations. A biological male results when a Y chromosome is inherited from the father, producing an XY pairing. Y DNA is passed on *in toto* from the father to the son, as the Y chromosome is passed as a complete allele that is not generally subject to recombination. Humans share XY chromosome structures in common with some insects (fruit flies), reptiles (certain snakes), fish (like guppies), and even plants (such as *Ginkgo biloba*).[235] The sex chromosomes are associated with sexual differentiation between male and female and for the specific expressions of primary and secondary sex characteristics. Primary sex characteristics in humans include those regarding one's reproductive organs and fertility, while secondary sex characteristics pertain to body hair, musculature and robustness, skeletal formation, Adam's apples, breasts, voice, and etc. The secondary sex characteristics are generally expressed upon the arrival of puberty and the increase of estrogen or testosterone, whereas beforehand boys and girls are generally similar in the structures and forms of their bodies and faces and are more similar, though not the same, also in their behaviors. Upon maturity, women tend to become more feminine as a result of increased estrogen, coming out in the sound of their voice, the width of their hips, the pronouncement of their breasts and buttocks, and more. Men tend to become more masculine, gaining a depth to their voice, broadening of the shoulders and chest, increased bone and muscle mass, facial and body hair, etc.

The other DNA found in the cell nucleus are the 22 autosomes, which are unrelated to one's sex characteristics, instead providing the individual with their other traits. These come from both the mother and father in corresponding pairs, and can come from any one or mixture of the grandparents' DNA passed on from these individuals.

Outside of the cell nucleus, in the mitochondria, is the *mtDNA*, or "mitochondrial DNA," the only DNA outside of the nucleus. Males and females both inherit mtDNA from their mothers, but only females pass it along to their offspring, similar to how Y DNA is only passed by the father. As such, as Y DNA is a direct line of descent from grandfather to grandson, the mtDNA is a direct line of descent from grandmother to granddaughter. These can both be used to trace ethnic origins related to paternal and maternal lineages and are useful in tracing population migrations. However, they say nothing of the ethnic origins of one's paternal grandmother or maternal grandfather.

The standard model of evolution appears to function in some demonstrable areas of life. However, there is a dilemma when it comes to limiting inheritance to Mendelian traits or to entropic genetic mutations. There are many forms of non-Mendelian inheritance, such as *polygenic traits*, those traits that result emergently from the interaction of two or more genes or alleles. Typically, that is, a single gene will not be responsible for a given trait in a large animal. When a single gene is not responsible for a given trait, but instead an *allele*— or pairing between the *loci* or locations on a matching chromosome— is, this is called a trait of *polygenetic inheritance*. Polygenic traits in humans include skin color, eye color, hair color, height, weight, and more. There is also need for the explanation of the introduction of completely new and novel genetic material, unresultant from genetic entropy as is demanded by explanations from the standard model. Still, it is nonetheless the case that natural selection operates upon traits, whether they are polygenic or due to genetic drift.

[235] Unlike with humans, however, who receive a male from a heterogametic match, XY, males are produced in the ZW system when a homogametic match, ZZ, is established, while females result from heterogamy, ZW.

Complicating things further, *E DNA*, or "environmental DNA," refers to DNA that has been lost or shed by organisms into the environment, but which nonetheless remains available. This happens simply through the process of living, but it can also occur in mass at the time of death. This DNA accumulates in the environment and interacts with other organisms, at times influencing their own genome. Oils on human skin, for instance, are excreted and interact with environmental stimuli before being taken back in by the body, allowing for horizontal gene transfer to occur, as per the Hologenome Theory coming from thinkers such as Lynn Margulis and Richard Jefferson. Ingested or inserted genetic material, such as that eaten, inserted into a cell by a virus, or perhaps even entering the orifaces, may also be transferred. E DNA has also been associated often with biofilms, or communities of bacteria, perhaps providing new avenues for evolution to take place from the bottom, up. In a process called *transformation*,[236] *competent* cells, those which are capable of using large amounts of E DNA, readily take up E DNA, sometimes even killing incompetent cells so as to take their DNA from them. This generally occurs between similar or related organisms. Alternately, *conjugation* results from non-sexual "mating" of organisms, similar to accretion. *Transduction* is what happens when a virus inserts new genetic material into a cell.

Various forces of natural selection are understood to be in operation on the genes, including ecological, sexual, kin, social, and cultural selection. *Ecological selection* refers to forces acting from the natural environment, such as climate, geography, and life outside of one's own social or kin group. *Sexual selection* refers to the forces related to sexual reproduction, such as selection of mental, physical, and/or social attractiveness to mates. *Kin selection*, again, refers to forces provided by related individuals to the benefit of another's reproductive success that may be detrimental to one's own, as when reciprocal altruism may be extended between siblings (common in the order Hymenoptera, which includes ants, termites, bees, wasps, etc.). *Social selection* refers to pressures from society that may lead one to be favored or disfavored, such as by way of gossip that harms one's reputation. *Cultural selection* is in reference to pressures applied by cultural, rather than genetic, factors. Some of these factor into further theories of group selection or multi-level selection. No matter the form, though, selection is a process wherein ecological, sexual, familial, social, or cultural niches are opened and closed to organisms or communities of organisms, who adapt accordingly or perish.

The syntropic basis of life suggests that unfilled niches exist as fully-filled niches *materially* in the future present (when they are filled), but not in the immediate present (when they are not). The niche is an environmental or temporal demand to be filled and a corresponding will in an organism to do the filling. The attempt to fill it is motivated by instinct for, or the hope or expectation of, satisfaction. The motivation is made presently of ideas, not matter, but the result of the motivation materializes a future present.

An example of syntropy in evolution outside of polygenic traits is reticulate evolution. *Reticulate evolution* refers to evolutionary processes that are not described well on a classic taxonomic tree, belonging instead to a weblike network that may involve instances of both convergent and divergent evolution. The convergent aspects of this form of evolution have been traced to symbiosis and symbiogenesis, horizontal gene-transfer, and *hybridization*, the mixing of species, as relayed by books such as *Reticulate Evolution* by Nathalie Gontier and her cohorts.[237] *Symbiogenesis*[238] is the manner by which eukaryotes developed through *symbiosis*, long-term biological interactions, with prokaryotes. By

[236] *Transformation* has another meaning in biology, as well, as it refers to the pre-Darwinian views of evolution, such as those held by Jean Lamarck and Robert Chambers, often contrasted against mutation, and sometimes associated with early deism

[237] See Gontier

[238] As proposed by Andreas Schimper and Konstantin Mereschkowski

this view, different sorts of prokaryotes, including archaea and bacteria (in a "first merger"), merged into eukaryotes in a "second merger." Lynn Margulis, in *Symbiosis as a Source of Evolutionary Innovation: Speciation and Morphogenesis*, invented the concept of the *holobiont*, referring to a symbiotic community surrounding a host species. She believes that symbiosis is a major driver of evolution, and that organisms evolve largely by way of symbiotic combination, pointing to such things as cell organelles—such as mitochondria or chloroplasts— as having once been independent bacteria. Eukaryotes, for instance, are understood to have consumed bacteria through *phagocytosis*—eating them—, after which the bacteria started inhabiting the eukaryotes, thus enabling both mitochondria and chloroplasts as organelles. Many of the symbiotic mergers occur by way of *endosymbiosis*, a prior, often "obligate mutualistic" arrangement wherein organisms live within a host, such as with gut bacteria[239]. As the mergers of prokaryotes and eukaryotes occurred, these organisms were filling a niche. This niche corresponded with an environmental cline of some sort, but, as oriented in time, existed as a compelling future. This compelling future served as a *morphogenetic field*, a noumenal template for the organisms, bringing them together into a higher creature. Plants, suggest holders of this view, involved this new eukaryote with photosynthetic bacteria (prokaryotes) into a "third merger," while animals and fungi are derivatives of the eukaryotes before their merger with photosynthetic bacteria into plants. Were this process to continue, we might expect at some point a fourth merger between animals and fungi or plants.

By the process of evolution, simple single-celled organisms formed colonies that would develop into multicellular creatures. The *Cambrian Explosion*, or "Biological Big Bang," as described by William Buckland,[240] had brought about a wide array of animals. Before this, animals were singled-celled creatures, sometimes forming into colonies. The Cambrian Explosion saw the very rapid production of multicellular creatures from out of those colonies. These multicellular creatures themselves form groups, such as, among humans, families, bands, communities, and societies, some of them— like the ants— already having established what biologists call *superorganisms* in their hives, societies so organized that they act as an organism. Herbert Spencer, an early evolutionary sociologist, suggested that we humans also form societies that behave like organisms.[241] As an organism evolves, showed Spencer, it increases in its complexity, and forms specialized parts, like *organs*, by which the body maintains organization, distributing necessary nutriment throughout the parts. From multicellular, sexually reproducing eukaryotes developed more complex plants, animals, and fungi.

Speciation is the process by which organisms become separate species. Often, this takes place by way of mutation and isolation. When an organism *mutates*, typically by passing along offspring with novel changes to their genetics, it comes out differently from other organisms. If this mutation is not a hindrance in finding a mate and surviving, it is considered to be either a neutral or a positive mutation, and will tend to be passed around, contributing a novel new element to the species. However, if a species has been divided,[242] the isolation of the two populations may lead mutations to accumulate

---

[239] Sloths are an ecosystem of their own, being host to tons of insects, and may stand as an example of endosymbiosis, as the algae that has come to inhabit their fur might be considered an integral part of the sloth.

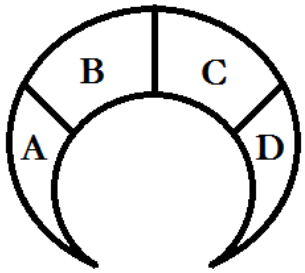
[240] Buckland is known for denying flood geology after first supporting it, favoring glaciation as an explanation for events typically ascribed to floods. Like Cuvier, he also denied that humans had co-existed with any extinct animals.

[241] Humans are constructed of many cells, which are interdependent beings who have united to construct our bodies. Just the same, humans have united on a larger scale to create society. What has made this possible? What is the binding force that has allowed humans to create an organism larger than ourselves, capable of responding to stimuli, and composed of specialized and interdependent units which, on their own, could not exist? It is our ability to socialize, which is due further to our freedom of will, and our ability to think, plan, and organize toward the accomplishment of future goals.

[242] Sympatrically or allopatrically, for instance

separately as well.[243] If the two populations become so different that they can no longer produce viable offspring together, they have *speciated*, formed into two separate species. At least, that is the mainstream definition of *species*. Josiah Nott and others, following Prichard and Morton, define *species* differently, as a set of communicable and identifiable traits that are passed on from generation to generation from a certain place of origin, separating one group from another. This is different from the demand that species cannot procreate between one another. According to this manner of thinking, *remote species* are those that cannot produce offspring, *allied species* can produce infertile offspring, and *proximate species* can produce fertile offspring. Nott believed that different species could procreate.

Speciation is something that is observable in Nature to some extent, especially by looking at what are called *ring species*. *Ring species* are species that form a kind of loop around an environmental *cline* of some kind, a zone of environmental and organismic interaction, such as around the base of a mountain, the shore of a lake, or etc. Such populations may at times start to adapt to particular niches around the cline, such that they start to deviate from one another. So long as gene-flow is maintained between the populations, however, they remain the same species, despite their divergence. It is just that some genes do not "stick" because they get deselected. However, there may be times, leading up to speciation, where genes may flow between one subpopulation to another, but may not be able to flow to other ones. For instance, in a ring species, a species will develop subspecies (A-D) along an environmental cline, such as alongside a river basin, around a mountain, etc. As the subspecies adapt differences, they become less likely to reproduce, sometimes making members within the same species unable to reproduce viable offspring with any likelihood. The thing that keeps them from speciation is subspecies between which may bridge them. For instance; in a species with subspecie populations A-D; A and D themselves may be unable to reproduce, but a bridge may be created if A can mate with B, B with C, and C with D, or in a number of other combinations. If this bridge is broken, however, speciation occurs. Ring species are very common throughout Nature.



John Christopher Willis proposed an alternative explanation to evolution called *age and area*, which suggests that the older a species is the larger the range of space that it will occupy. It is considered by many to be a form of *saltationism* or *macromutationism*, a theory of evolution that relies on the existence of large or composite mutations, and a form of *orthogenesis*, or goal-directed evolution. Willis had accumulated a mass of data to demonstrate his theory as being the case, and corresponded with zoologists to corroborate this data with animals, finding many supporters for a short span of time. Some cultural anthropologists have also controversially utilized a concept called the *age-area hypothesis* that suggests that cultural characteristics spread from their origin point such that older cultures will have more span of area, such that larger cultures can be considered to be older, seemingly derived from Willis. It is interesting to consider the age-area models relative to an alternative model of the Earth, too, the Growing Earth model, which might suggest that the appearance of new landforms may have something to do with the appearance of new species. Considered further, and in light of Lev Berg's idea of *nomogenesis*— that macromutationism and the internal and external conditions of species and environment suits species nearly perfectly to their environments in a linear development—, these new species could be nearly perfectly-suited to their new environments, the new landforms and climates. Both the macromutations and the change in land mass might have something to do with increased solar activity during a cosmic phase change-like event.

[243] Also, genetic drift may occur

While speciation is observable in nature and in the fossil record, there have nonetheless been those who have remained skeptical about the ability of observable kinds of speciation to explain major changes in evolution, particularly morphology. Religionists, for instance, will often argue that *microevolution*, or *gradualism*, is possible, that organisms adapt to their environments, even changing form as with a chronospecies by way of anagenesis,[244] but that *morphological* changes—those between different forms, such as between a horse and a donkey— are not possible by way of a gradual program of adaptation. They seem to have some support for these arguments by way of the fossil record, such as the *punctuated equilibrium* pointed out by Stephen Jay Gould, observed as the quick extinction of species followed by a rapid morphological replacement. Stephen Jay Gould was clear that this was just a paleontological fact, even if an explanation has not been found.

Where Darwinism is particularly strong is where it describes physical processes of selection. It describes quite well how genetic drift may occur, or how species become selected in and out by their environments. But even processes such as genetic drift, which operate strongly in microevolution or adaptation, and merely divide existing genes and entropic mutations thereof to suit specific environments, cannot be understood to be responsible for the addition of new genetic material, and seem unlikely candidates for being held responsible for *morphogenesis*, the origin of new morphologies.

Darwinism faces a particularly hard challenge when it comes to describing mutations and their directions, or other actions exemplified by free will, such as social and sexual selection (which will be discussed later), or forms of learned behavior. Genetic mutations are generally externally caused by exposure to ultraviolet light, chemicals, or radiation, or are internally caused by "mistakes" in the structure of the DNA, such as the way chromosomes are wrapped in *meiosis*. Though these causes can be named, mutation is still put into the category of "random," due to its unpredictability. This "randomness," however, poses great problems for scientific determinism, as randomness is not a positive claim of empirical evidence.[245] Ken Wilber remarks, in *A Brief History of Everything*, that

> The standard neo-Darwinian explanation of chance mutation and natural selection--very few theorists believe this anymore. Evolution clearly operates in part by Darwinian natural selection, but this process simply selects those transformations that have already occurred by mechanisms that absolutely nobody understands.[246]

Natural selection is not enough to provide a direction or answer to mutations on its own, though it certainly plays a role in screening genes once they are in place. The very nature of life's order goes against known laws of science, and relies completely on "chance" and "luck." Ken Wilber remarks on the nature of mutations and the role they must play in evolving functional wings, for instance:

---

[244] *Chronospecies* refers to a species that evolved sequentially without branching into a new species by way of accumulated mutations that make it sufficiently different from its ancestors to be classified as a new species. *Anagenesis* refers to the process by which chronospecies speciate without splitting. The opposite of anagenesis is *cladogenesis*, the genesis of new clades by way of divergence. *Cladosynthesis*, if I may coin the term, could refer to the fusion of clades by way of convergent evolution, polyphyly, and hybridization.

[245] Is randomness not instead an example of freedom, of will, in contradiction with determinism? Is it not the immeasurability and unpredictability of human and other organic behavior that has led us to classify the social and living sciences as "soft" and works of a spiritual nature as completely non-scientific? Mutations, then, are where Darwinism breaks down, and where evolution by natural selection goes "soft" or "spiritual." Again, this does not mean that the process of natural selection is invalid or unsound, as there is much evidence to support the idea of evolution by natural selection. However, evolution by natural selection relies on this notion of randomness in mutation, which greatly limits its empirical and deterministic claims, and demands use of complimentary forms of knowledge considered less scientific, perhaps more spiritual.

[246] Wilber[3], 20

> Take the standard notion that wings simply evolved from forelegs. It takes perhaps a hundred mutations to produce a functional wing from a leg—a half-wing will not do. A half-wing is no good as a leg and no good as a wing—you can't run and you can't fly. It has no adaptive value whatsoever. In other words, with a half-wing you are dinner. The wing will only work if these hundred mutations *happen all at once*, in one animal—and also these *same* mutations must occur *simultaneously* in another animal of the opposite sex, and then they have to somehow find each other, have dinner, a few drinks, mate, and have offspring with real functional wings.[247]

One explanation for the occurrence of macroevolution is the Creationist or Intelligent Design one, that intelligence from God creates things anew. Another is the catastrophist one, often coinciding with the religious view, that geological catastrophes are what disrupt the evolutionary stasis and reset things. Rupert Sheldrake has a neo-Lamarckian quantum explanation, that experiences inform one's morphology, which, as also explained by Amit Goswami, makes quantum leaps thereby. Goswami holds that Conrad Waddington had proposed *epigenetics*, changes to the phenotype or gene expression due to environmental stimuli—now widely accepted—, as a sort of morphogenetic field. Goswami says,

> The cells of each type of organism function differently because they make different proteins by activating different sets of genes. The source of the program that determines which genes to activate is called a *morphogenetic field*. Nonphysical and nonlocal, a morphogenetic field is the blueprint of form, an idea reintroduced into biology by Rupert Sheldrake.[248]

Goswami, building on Rupert Sheldrake's view of morphogenetic fields, points out that if mutations occur on a quantum level they are due to such quantum effects as wave-particle duality, meaning that the particles making up the DNA are not only existent in particle form, but also in wave form. A morphogenetic field, suggests Goswami, might also be thought of as a sort of quantum possibility wave or *superposition*-- being specifically in one location as a particle, but generally everywhere as a wave, at the same time--, from which a mortal form will be derived. Morphogenetic fields may be viewed as an organism's possibility waves rooted nonlocally and in the future, or as a range of genetic possibility. An organism has an allotted amount of general possibility, because its genetics are constructed from subatomic particle-waves, but only one of those possibilities is actualized into a physical position in our Universe. What we see as the physical being is actually multitudes of particles that are in superposition, with both a wave-existence and a physical position caused by the observer affect, or being viewed. Mutations are not excluded from this process! Goswami remarks,

> It is a fact that mutations [...] are quantum in nature. They are mere superpositions of possibilities before consciousness has collapsed them. Suppose the quantum superpositions of mutated genes wait in limbo until enough of them accumulate to give rise to a phenotype trait leading to new form. Not only the gene mutations are quantum processes, but also the making of form from genes (morphogenesis). Both evolution (of the mutated genes) and morphogenesis of the new trait wait in limbo as superpositions of many possibilities, from among which consciousness can see a pattern that is just right for mapping a meaning-blueprint contained in its vital body.
>
> Why should a form that occurred in the past be chosen? The answer is that forms are conditioned as part of the developmental history of Life.[249]

---

[247] Wilber[3], 20
[248] Goswami[1], 214
[249] Amit Goswami[1]

Life decides for itself (relative to classical determinism), to limited but growing degrees, the coordinates in which its waves will "collapse." If taken outside the realm of genetics, a field may also be applied to one's larger being. For instance, my possibility wave, or field, is composed of all of the possible scenarios that can physically occur. My possibility wave includes me sitting at my computer as I type this, getting up and grabbing some food, letting the dog out, amidst a number of other, very doable scenarios. Only one will happen physically in this Universe, though; that reality which I decide to realize, to collapse. Similarly, one's genetics are capable of a number of mutations, caused by the superposition of particles involved in the molecular structure, but only a fraction of mutations actually occur in this Universe. The same is true on levels above the individual.

According to Sheldrake's model of "morphic resonance," there is a nonlocal exchange of information between the organism and the morphogenetic field, which responds to the experiences of the organism by way of spontaneous morphological changes. Mutations are changes in relation to the morphogenetic attractors that affect patterns of growth. Sheldrake says that

> The fields organizing the activity of the nervous system are [...] inherited through morphic resonance, conveying a collective, instinctive memory. Each individual both draws upon and contributes to the collective memory of the species. This means that new patterns of behaviour can spread more rapidly than would otherwise be possible. For example, if rats of a particular breed learn a new trick in Harvard, then rats of that breed should be able to learn the same trick faster all over the world, say in Edinburgh and Melbourne.

He says, "[t]here is already evidence from laboratory experiments that this actually happens."[250] Goswami, a Hindu and a *monist idealist*— believer that all of existence is ultimately mental—, holds that one's mental states ultimately affect one's outcomes from the morphogenetic field, such that, as the old saying goes, "you get what you wish for." Goswami holds that quantum morphological leaps correspond to punctuations to the stasis of the fossil record, and explain them.

Still another view on macroevolution is that changes occur through those things that human societies find to be taboo, such as beastiality, incest, and the like. This latter view, a hypothesis which creepily seems to correspond to some evidence, is called *Stabilization Theory*, and its originator is Gene McCarthy. According to McCarthy's view, macroevolution is explainable by way of interspecific hybridization and repeated backcrossings. This view will be explored more a little later when hybridization is explored.

Eons and Epochs

Mary Anning was a working class fossil hunter and religious dissenter who ran a famed fossil shop. Often visited by other naturalists who would plagiarize her wisdom, she was nonetheless also visited by many of the famed geologists of the day, who would at times give her credit for her achievements and even attend workshops on *paleontology*, the study of life from the distant past. She discovered *Ichthyosaurus* and *Plesiosaurus*, marine reptiles, as well as *Pterosaurus*, a flying reptile the most famous example of which is the *Pteradactyl*. Her discoveries would be seen as proof of extinctions. William Conybeare had also discovered *Plesiosaurus* and Gideon Mantell discovered *Iguanodon*, a dinosaur with a large spiked thumb. William Buckland similarly discovered *Megalosaurus*. An Old Earth catastrophist who believed *The Bible* described a beginning after an already-existing creation, he had believed in Noah's Flood but rejected flood geology otherwise. He also discovered an ancient hyena cave. Richard Owen would go on to call the reptilian discoveries *dinosaurs*, meaning "terrible lizards."

[250] Sheldrake

But mammals such as *Megatherium*, the Giant Ground Sloth, were also being discovered, as analyzed by people such as Georges Cuvier. Around the same time as the conflict between Cuvier and Lyell, William Smith, a working class man, was embarking on his geological exploits, including the making of a nation-wide geologic map and establishing the *Principle of Faunal Succession*, that fossils of creatures of different time periods are not found in the same strata together. William Maclure, also known as a follower of the utopian socialist Robert Owen, was producing a geologic map in the United States as well. Long before Cuvier's and Lyell's conflict, and so also before William Smith, Nicholas Steno had pointed out that fossils such as sharks' teeth were not natural stones. His observations about geology and paleontology eventually led him to establish the *Law of Superposition*, that older strata of the Earth occupies a lower position, being underneath the newer layers. This established the concept of *stratigraphy*. He also contributed the *Principle of Lateral Continuity*, that sedimentation layers that are separated by such things as canyons, valleys, or other erosions can be assumed to have been originally connected. The combined insights from geology and paleontology were starting to provide a clear picture of the world wherein great changes were taking place, changes that would eventually be known as *eons* and *epochs*, categorized according to stratigraphy and fossil content. This began, perhaps, with Adam Sedgwick's identification of Cambrian and Devonian layers, Roderick Murchison's identification of the Silurian and Permian, and William Bonybeare's and William Phillips's discovery of the Carboniferous, for instance. Phillips would go on to define the major Cambrian eras, the Paleozoic, Mesozoic, and Cenozoic, as well as some of their periods. Others would continue to define the periods and epochs within the eras.

The Phanerozoic Eon would begin with the *Paleozoic Era*, which contained periods such as *Cambrian*, the first of the Phanerozoic, wherein complex life appeared, including *arthropods*, or "bugs,"[251] such as Trilobites. Most of life was in the sea, including, after some time, some fish and plants, some of which were likely land-dwelling. According to a standard account of evolution, the first animals were simple creatures such as sponges, sea anemones, corals, and jellies, and then worms, jawless fish, starfish, sea urchins, sea cucumbers, and other such beings as those. Lamprays and hagfish, and then placoderms— primitive fish— appear, before more modern fish arrive.

The *Ordovician Period* would see the appearance of jaw-bearing fish and the onslaught of land-dwelling plants. The *Silurian* and *Denonian* would see the increase in this onslaught with vascular plants and moss forests, and the development of bony and scaly fish, a proliferation of land-dwelling arthropods, and fugal expansion, eventually seeing the development of a fish-dominated ocean, full-blown forests of primitive and seed-bearing (*spermatophyte*) plants and gigantic mushroom-like fungi, with true insects. Fish give rise to the *tetrapods*, or four-limbed vertebrates,[252] and then *amphibians*, which we recognize today in the form of salamanders and frogs, requiring water in which to breed.

The *Carboniferous*, wherein coal is found in abundance, saw the appearance of early conifer plants and a proliferation of ferns, giant arthropods, the tetrapods develop into the amphibians,[253] and amniotes, among them *anapsids*, *diadectomorphids*, *synapsids* and *sauropsids*, or the forerunners of reptiles, mammals, and birds, develop from the amphibians.[254] Amniotes do not require water in which to breed.

---

[251] Related, perhaps, to those such as centipes, flies, and spiders

[252] Having a backbone

[253] Some of which did not have limbs, but were snake-like, suggesting perhaps a non-linear development or convergence of the clade from multiple sources

[254] Together, birds and reptiles are called *sauropsids*. *Sauropsids* diverged as "dinosaurs" from the *archosaurifroms*, commonly considered to be *diapsids*, today represented by crocodiles, which are considered about as closely related to birds as other reptiles. Birds, too, would come from the *diapsid* line of the *amniotes*, while mammals are claimed to have come from the *synapsids*.

We readily recognize amniotes today as turtles, geckos, iguanas, alligators, caymens, crocodiles, monitor lizards, and so on. Amniotes also include the birds and mammals.

The *Permian* would see the expansion and diversification of the synapsids and the sauropsids, and the appearance of *therapsids* and *cynodants*, developments closer toward the mammals. The famous *Dimetrodon*, the "dinosaur"[255] with a "sail" on its back,[256] lived during the Permian, which was also full of large amphibians such as *Eryops*. The *therapsids*, which include *Therocephalia*, meaning "mammal-like reptiles," had among them creatures such as the "calf-faced" *Moschops*, a large herbivore. Other therapsids included among them *Inostrancevia* and other *Gorgonospians*, large predators with saber-teeth. The Gorgonospians have been compared to both reptiles and to cats, and one might imagine something like a *monitor lizard*, a large reptile including today's Komodo dragons, crossed with a *saber-toothed tiger*, an extinct cat that had not yet evolved yet. Other therapsids include *Robertia*, a small reptile diverging toward rodent characteristics, *Lystroaursus*, a medium-sized herbivore with two front tusks, and *Lycosuchus*, similar in some respects to the Gorgonospians, but having legs that were placed more beneath the body, rather than relying on them jutting outward like a monitor lizard. *Cynodants*, meaning "dog-like teeth," were *therapsids* who had both herbivorous and carnivorous members among them, such as the sometimes herbivorous *Cynognathia* and the carnivorous *Probainognathia*.[257]

The *Mesozoic Era* is the one that is generally associated with the dinosaurs, and contained the Triassic, Jurassic, and Cretaceous. In their time as dinosaurs, *diapsids*, a form of sauropsid, were the dominant lifeform, though always in competition with other *sauropsids* and *synapsids*.

During the *Triassic Period* of the Mesozoic, diapsids called *Archosaurs* were dominant, among them the crocodiles and dinosaurs such as the small *Protosaurus*, *Plateosaurus* the possibly semi-aquatic biped, the incredibly long-necked and almost snake-like *Tanystropheus*, the monitor-lizard-like *Trilophosaurus*, and flying Pterosaurs. Therapsids of the time included the tusked Dicynodonts like *Lystrosaurus*, *Therocephalids* such as *Glanosuchus*, and *cynodants* such as *Cynognathus* and the "true dog-toothed" *Eucynodontia*.

The *Jurassic* would see the development of *Ornithischians*, which include famous dinosaurs like the tail-club wielding *Anklosaurus* and the prong-tailed *Stegosaurus*, as well as *Theropods*— or three-toed dinosaurs with hollow bones— including *Coelerosaurs* like *Allosaurus* and those preceding *Tyrannosaurus Rex*, and others. *Mammaliforms*, which would move toward the mammals, developed from out of the synapsids, most commonly claimed from the therapsids. These were early proto-mammals that included the rodent-like *Morganucondonta*, *Docodonta*, *Eutricondonta*, and others. True mammals would follow, including *Therians*, which include today's marsupial and placental mammals.[258] Among the mammals today are the rodents and bats, whales, dolphins, and porpoises, cats and dogs, bears and foxes, seals and sea otters, cattle, sheep, goats and deer, and primates, to list a

[255] Considered colloquially among the dinosaurs, but today classified separately

[256] Similar to *Platyhystrix*, an amphibian

[257] Among the *cynognathids*, for instance, would be the *Traversodontids*, which had adapted to herbivory. *Cynognathus*, on the other hand, was a predator. Some of the Probainognaths would later evolve toward herbivory as well, and some would also evolve to become *mammaliaforms*. These included proto-mammals such as *Morganucodonta*, *Docodonta*, and *Hadrocodium*, small rodent-like creatures considered close relatives to true mammals.

[258] The problem with this standard model of the mammals, however, is that it assumes a predatory background, while most small mammals are herbivorous or generalists. While *convergent evolution*, the evolution of similar traits arising separately from one another, certainly does occur, such that herbivory could have evolved on multiple occasions, another possibility is that some form of *hybridization*, or mixture, was taking place between animals, as will be explored later when we get closer to human evolution.

small sampling of the kingdom today. The animals that we know today came from much different ones of the past. The earliest mammals, evolving from the mammaliaforms, were possibly very small creatures, like today's shrews, mice, and rodents of various kinds, though the synapsids did get quite large before their extinction. Among the early mammals were creatures such as *Castorocauda*, a beaver-like creature and Jurassic mammaliaform, and *Tritylodon*. *Repenomamus*, and other *Gobiconodontiae*, were also small Jurassic and Cretaceous mammals. Mammals would evolve characteristics such as hair and mammary glands.

Geologic	Eon,	Era,	Period,	Epoch,	or Lithic Period

					Etc.

The *Cretaceous* saw a proliferation of mammals, sometimes rivaling the dinosaurs, though typically fairly small. Mammals eventually developed live birth, although some *monotremes*—early mammals—, such as the duckbilled platypus, still today lay eggs. *Eutherians* are commonly considered to be more closely related to placental animals than to marsupials and monotremes, while *metatherians* are the opposite. Both of these developed during the Cretaceous. *Tyranosaurus rex*, *Deinonychus*, *Velociraptor*, *Triceratops*, and many other large dinosaurs roamed the land. Ants and termites, and many other insects developed, and grasses and flowering plants started to appear.

The close of the Mesozoic would bring about the *Cenozoic Era,* the one of our own time, the "Age of Mammals." This included the Paleogene, Neogene, and Quarternary periods. The general trend throughout this Age was one of cooling and of increasing glaciation, with epicycles including warm periods or interglacials. There was also a tendency toward dryness, with some periods of wetness. Over time, a once tropical climate had retreated to the equator, replaced by temperate conifer and deciduous forests, grassy savannahs, and desert shrublands. Antarctica connected to South America and Australia during Cenozoic, and perhaps to Madagascar.It was in the latter stage of the Cenozoic that humans had made their home, but the Age of Mammals is presented here as a whole to provide some context for the kinds of climatic and ecological pressures that might have sculpted our species, the kinds of species that we came from, and how that might have occurred.

The *Paleogene* was the period of the Cenozoic in which mammals began to diversify and take over the planet. It was composed of the Paleocene, Eocene, and Oligocene. The *Paleocene* was an overall very hot and moist epoch, with a tropical climate except at the North and South poles, which were temperate. The last wave of the dinosaurs had been extinguished in the turn of the ages, with an asteroid being named as the cause by mainstream scientists. In the turn of the ensuing *trophic collapse*, a collapse of the food web system, and *punctuated equilibrium*, a disruption to the standard progression, many new mammals appeared with diverse morphologies and unique structures, with natural selection acting to refine them over time. Among these were the placental mammals, which do not lay eggs or carry their young in a pouch like marsupials or monotremes do. Fossils from some of the earliest of these discovered, or perhaps of their recent ancestors—such as *Protungulatum*—, come from the Northern hemisphere in Northern climates, where temperate forests were dominant. The largest mammal of the period may have been the size of a possum, a marsupial found in the Americas. The *Eocene* was kicked off by an event that raised the temperature dramatically. From here there was a generalized trend of cooling, interrupted by chaotic epicycles of hot and cold periods. Seasonality was reduced in comparison to today, and it continued to remain warm enough for palm trees to grow in Alaska and for *ectotherms*—cold-blooded creatures, like amphibians—to live in Antarctica, which maintained a temperate forest for some time. Forests covered most of the dry land on the planet, and grass is found in this period but is not widespread. Many mammal morphologies appear, including those associated with the early primates, such as *Plesiadapis* in North America and—perhaps by way of Greenland— Europe, and *Archicebus* in Asia, which tended to occupy the Northern Hemisphere. The *Oligocene* would see the first polar glaciations of the Cenozoic Age, but was nonetheless much warmer than it is today. Overall the climate could be said to have been subtropical, with cashew trees growing across North America. Grasslands continued to expand, but savannahs had not taken over. Conifer forests and flowering plants were spreading. Large mammals roamed and had learned to run in the grasslands. From the early mammals had come early treeshrews and other such creatures, and, from them, the wet-nosed primates, like the lemurs and *adapiforms* (a class of extinct primates); dry-nosed primates such as the tarsiers; then the simians. The *simians*, such as the later *eosimians*, establish themselves as a unique clade of primates in Southwestern Asia. The simians break off into the *Old World Monkeys*, such as the baboons, macaques, mandrills, guenons, and langurs, and *New World*

Monkeys (like marmosets, capuchins, spider monkeys, and howler monkeys). According to mainstream thinkers, this may have occurred in Northeast Africa, starting with *Victoriapithecus*. Importantly, the lines between primates alone is not always so simple, either. Monkey lemurs, including *Hadropithecus*, were considered at first, by Lorenz von Liburnau, to be apes, but then later to be lemurs. The *Sifakas*, a type of lemur, go by *Propithecus*, though *–pithecus* is typically reserved for apes and ape-like monkeys. Similar occasions exist for *Mesopropithecus* and *Paleopropithecus*, considered to be sloth lemurs. Other animals, of course, had also started to develop and diversify, such as the *Barylambda*, a large herbivore, the wolf-like *Synonyx* and dog-like *Hesperocyon*, *ungulates* or hoofed animals, including archaic varieties of horses, such as *Mesohippus*, and rhinos such as *Uintatherium*, *Megacerops*, *Arsinotherium*, *Paraceratherium*, among others, as well as creatures such as hyena-like *Hyaenadon*, *Daphoenus*, or "bear-dogs," and cat-like creatures like *Dinictis* and *Proailurus,* pig-like *Daeodon*, camel-like *Poebrotherium*, and so-on.

In *Encyclopedia of Animals: Mammals* by Edwin Gould and George McKay, the chapters are arranged in such a way that it appears that the most ancient relics of early mammalian development are presented first, that is, in chronological order of the evolution of the various clades of mammals, beginning with monotremes, going onto marsupials, then edentates (a now-rejected category[259]), and so on. Following just the maps presented at the beginning of each section, it appears that the migration of mammalian evolution might be shown, as beginning in Australia, moving into South America, and then into North America and on into Eurasia and Africa, beginning with insectivores. If this is indicative of the natural migration of mammals, which agrees some with Buckminster Fuller's interpretation, it appears that the development of tree shrews, which are important to our own evolutionary history, may have resulted from a reconvergence of the mammals of Oceania and those that had made their way back toward New Guinea from out of the Americas. *Flying Lemurs*, bat-like creatures considered to be related to ancestral primates, then appear to develop from out of the tree shrews in Indonesia, while soon after bats emerge across the world. This is then followed by worldwide primate evolution.[260]

One pressing issue— when it comes to primatology—, and one that would be greatly serviced by adherence to an Expanding Earth as a working hypothesis is the origin of the New World Monkeys. The most widely-accepted or institutionalized view, at the present, is that floating islands broke off of the coast of Africa, transporting monkeys to the New World by a journey across the ocean on their grassy tuft. This poses many difficulties, of course. Firstly, there are no known examples in real life of this occurring. Secondly, food sources pose a problem for monkeys on the open ocean. Thirdly, there are no Old World Monkeys in the New World, as might be expected if Old World Monkeys were the parents of the New there. Fourthly, there would need to be a sufficient number of them to maintain viable offspring with strong fecundity, capable of withstanding the pressures of their new environment that they have not been ecologically selected to withstand. The list goes on. An Expanding and perhaps Contracting Earth would make this story much more believable, because a smaller Earth means much less ocean to accidentally traverse, perhaps none. That said, it is not entirely impossible, and in fact requires fewer assumptions, that Old and New World Monkeys evolved separately and independently, as has been suggested by Carleton S. Coon[261] and others. In such a case, there is no need for a raft story. Philip Sclater and Ernst Haeckel had famously proposed that primates had a home in a now-lost continent called *Lemuria*, which was used to explain the absence of lemur fossils in mainland Africa

[259] Due to its being considered polyphyletic

[260] From here after, the chronological theme of the *Encyclopedia* seems to have been chronologically broken up or overlain, the original seeming to have focused on the development of the primate lineage, with the other sections having more to do with the development of carnivores, ungulates, rodents, and so on

[261] See Coon[1], 658

and Western Asia but their presence in both Madagascar and in India. The idea was that there had been a continent that had connected Madagascar and India, and that this was Lemuria. Haeckel suggested that humans, too, may have come from Lemuria. When looking at constructions of Pangea, it appears that Lemuria was in fact Antarctica, which bordered both Magagascar and India, as well as South America. Of course, Pangea is considered to have been much older than the primates by the *Stagnant Earth* view, that of the conventional plate tectonicists. But that view functions largely to explain the distance of the continents from one another on a larger globe, which may not at all be necessary.

The *Neogene* was the period in which the apes would appear, and included the Miocene and Pliocene. Some suggest that the Neogene continues into what is otherwise known as the *Quarternary Period*. The *Miocene*, continuing the general cooling of the Cenozoic Age, would see a series of early polar glaciations, with large glaciers on Greenland. The forests retreated and, with further expansion of grasslands, grazers were establishing themselves more fully on the grasslands. Apes diverged from the Old World Monkeys, first with the *Lesser Apes*, otherwise known as the *Gibbons*. According to the standard model, this occurred possibly in Southeast Asia beginning with a species named *Proconsul*. There is a further split into the *Greater Apes*—which now includes the Chimpanzees, Gorillas, and Orangutans— from the Old World Monkeys, possibly in a place like the Anatolian region— controlled presently by the state of Turkey— with *Gripopithecus*, or perhaps beginning with the European apes such as the Dryopithecines or Hispanopithecines. Humans are likely related to existing Great Apes in both Africa and Southeast Asia, including especially the Chimpanzees and Orangutans, but perhaps also other primates, as will be explored later. The Greater Apes produce the *Hominins,* which includes Chimpanzees, humans, and extinct Great Apes. *Graceopithecus* in Greece may represent something of a missing link between humans and Chimpanzees, perhaps an early divergence from the *Pan* genus. Other Hominins, such as *Sahelanthropus* and *Paranthropus*, also existed at this time. Most Hominins subsisted by means of foraging fruit, insects, and sometimes foliage. Their sexual dimorphism was generally pronounced—with males having large canines and being larger in size than females— and their mating patterns were polygynous, with males controlling a harem of females either as lone individuals or in multimale-bonded coalitions, similar to Chimpanzees. Hominin social habits likely continued group formations called *troops* that are established by way of fision-fusion, the shifting between groups of individuals in a wild expression of free association. The *Pliocene*, as typical of the Cenozoic, would also see an increase in cooling, and was dry enough that the Mediterranean lacked seawater. The retreat of the forests and the expansion of the grasslands would see the establishment of savannahs and ranges, wherein browsers and grazers coexisted in something like semi-forested prairies. Dryness also meant that shrublands and desseritification were also starting to become more prominent. Hominins already diverged from the other Hominids of the Great Apes, but, according to the standard model, it was likely in the savannahs of Northeast Africa that the Austrolapithecines-proper—such as *Australopithecus anarensis*, *afarensis*, *africanus*, *garhi*, etc.— would first establish themselves. These bipedal apes would find themselves alongside *Kenyanthropus* and *Ardipithecus*,[262] among many other varieties of extinct Hominin. These are all at times referred to as Australapithecines, but they may more appropriately be referred to as *Homininians*. Like other Hominins, the diet of the Australapithecines was probably frugivorous and insectivorous with tubers and minimal foliage, grains, and seeds, and their mode of subsistence was by means of foraging. Increased intake of starches contributed to future brain development. By this time, primitive forms of most of the existing forms of animals had come about, with grazers and snakes proliferating in the grass. Placental mammals would eventually grow to include creatures such as the saber-toothed cats, ground sloths, and mammoths. The standard *Out of Africa* model, that humans evolved in Africa from out of the Australopithecines-proper, and came out

[262] Whereas *Australopithecus*-proper is more comparable to Common Chimpanzees, *Ardipithecus* was more similar to Bonobo Chimpanzees

in successive waves, leaves much wanting in the way of explanation and is founded upon divergent evolution or *adaptive radiation*, whereby genetic drift, an entropic process, gives way to new species. There are other likely locations, whereat the Australopihecines-*im*proper[263] might have convergently evolved. This topic will be addressed again later on.

Contrary to the standard model, *convergent evolution*— that which brings traits together or makes species alike— and strange beginnings show themselves throughout the fossil record, but perhaps most clearly in the efforts of the Florence and Carlos Ameghino. The La Plata Skull of Florentino Ameghino, for instance, which he called *Platyrrhinus dubius*, was originally thought to be a primate of the Miocene, having a large brain, being frugivorous or omnivorous, and representing a new species of *Platyrrhine* monkey. It is now considered an *ungulate*, or hoofed animal, while *Platyrrhinus dubius* is a type of bat. Some apparently hold it is that of a human, though. The bat was named after the Ameghino's primate due to similarities with the La Plata Skull regarding the nose structure (*platyrrhine* is "broad nosed"). Interestingly, *Megabats*, or Old World Bats, have been considered by some to be more related to monkeys than to *Microbats*, or New World Bats. Carl Linnaeus had considered bats to be a sister *taxa* to primates. Even today, there are those that hold to a "flying primate hypothesis." "Separatists" on the issue argue that Mega and Microbats evolved separately.

This confusion of bats for primates is not the only oddity. Florentino Ameghino also described *Notopithecus*, which he believed to be an early primate, but which is now considered to be an ungulate related to New World Pigs, though it resembles a rodent such as a priairie dog or a marmot, and *Transpithecus*, a close relative, and *Ultrapithecus*, another. They received the *–pithecus* suffix because Ameghino believed them to be early renditions of primates. But bats and monkeys are not the only species that seem to have convergently evolved in such a way. Florentino Ameghino described the *Pyrotherium romeroi*, for instance, which is apparently unrelated to elephants despite having evolved a trunk and tusks in much the same way.

There are many cased of animals from the fossil record bearing traits familiar to us from an existing animal, though those animals themselves belong to completely different clades, such that multiple distinct clades may produce members that appear "pig-like," "horse-like," dog-like," and so on. If there is an ancestral relationship to existing animals, it may best be explained by way of McCarthy's stabilization theory, or perhaps something like it. In such a case, humans may be derived from a number of different animals or their common relative, perhaps including bats and pigs, but also some relative of kangaroos and sloths, among other creatures.

Gould and McKay tell us that Frederic Wood Jones had argued that humans had not ever gone through a formal "primate stage," but that, instead, humans had evolved more directly from out of a tarsier-like primate in a more generalized form.[264] Gould and McKay suggest that, early on, humans had been placed into a clade separate from other primates, called *Bimana*. Another possibility is that humans evolved from adapiforms such as *Caenopithecus* in Europe and the Americas and that this is responsible for the present absence of othe primates in these areas. Jorn Hurum, Philip Gingerich, and others, for instance, have been of the opinion that *Darwinius* demonstrates the possibility that anthropoidal primates came originally from the adapiforms. It would make some sense if this was the case, particularly because the adapiforms are extinct primates that seem to have occupied much of the area that the earliest humans evolved in, such as holarctic Eurasia and America. It seems that, if humans were to have evolved from something, that that something might no longer exist. Indeed, many

[263] In this case, concepts such as *Australopithecine* and *Homo eretus* do not necessarily entail taxonomic similarity according to shared heritage, but according to semi-noumenal or emergent categories of similarity
[264] See Gould and McKay, 130

Christian skeptics of evolution have long asked, "If people evolved from apes then why are there still apes?" Such a question could not be posed in opposition to evolution from adapiforms, which are long gone from the areas we now inhabit. While *Caenopithecus* and *Darwinius* inhabited Europe, for instance, similar adapiforms inhabited North America, such as *Ekgmowechashala* and *Palaeohodites*. Something similar might be said of the Omomyiforms, such as *Teilhardina*. It was through comparisons of the proteins in existing Great Apes by Morris Goodman and Vincent Sarich, and the jaws and teeth of extinct Great Apes such as *Ramapithecus*, *Dryopithecus*, and *Sivapithecus* by Peter Andrews and John Cronin, that it became established in the mainstream that humans are closely and evolutionarily-related to the Great Apes and not to a clade of their own.[265] But some disagree.

The *Quarternary*, sometimes considered the late Neogene, was a time in which humans started to spread across the planet. It is broken up into the Pleistocene and the Holocene. The Pleistocene would contain the Early Stone Age, while the Middle and Late Stone ages would falls into the Holocene. These ages are separated not so much by species as by the types of tools that Hominins were producing.

The *Pleistocene* is typically what people are talking about in reference to the *Ice Age* when spoken of in the wider, but not the narrower, sense, as it contained many interglacials. Permafrost and tundra covered much of the landscape during repeated glacial cycles with epicycles of warmer interglacials and interstadials. Savannahs and forests were common, but desertification was becoming much more of an issue as more fresh water got trapped in the glacial ice. Large mammals such as woolly mammoths and mastodons, woolly rhinos, bison, aurochs, ground sloths, *Gigantopithecus*, short-faced bears, cave hyenas, and saber-toothed cats roamed the land. The genus *Homo*, or "human," would arise with the evolution of *Homo habilis* and probably also *Homo floresiensis* if not more, and would continue on into the present day with the various subspecies, races and subraces, or breeds of modern humans. Like the Australopithecines, humans started out as foragers, going around and eating what they could find on the spot. Humans would diversify their diet more and more with grains, meat, and dairy as time went on. Hallucinogenic mushrooms may also have contributed to their mental development. Their sexual relationships would tend more toward monogamous pair-bonding and their sexual dimorphism would reduce, with both sexes, but especially females, showing an increase in gracility.

One of the hallmarks of being human is walking upright. Another is the use of tools, such as stone tools, which would bring us into the Stone Age, particularly into the *Paleolithic*, or "early Stone Age," when most tools were made of stone and were very crudely constructed.

Gabriel de Mortillet, who had organized stone tool industries into the Chellian (Acheulan), Mousterian, Solutrean, Magdalenian, and so on, discovered *eoliths*, very minimally constructed stone tools or natural artifacts, and considered them to have been made by a "tertiary man," which is now understood to be *Homo erectus* (as during Mortillet's time only Neanderthal was known, although *Homo erectus* is not the producer of the eoliths but of the Acheulan tool industry). Eoliths were rejected by Marcellin Boule, a supporter of the idea that Neanderthal was more primitive than it was, who attributed the tools to glacial wear. Gabriel de Mrotillet, then, was correct about there being an older species than Neanderthal, who he believed to have made Acheulan tools, but is considered wrong today for considering the eoliths stone tools. There is still much debate as to whether the eoliths are actually stone tools or not. Aime Rutot believed that eoliths were human-produced, and held that the Boncelles eoliths were from the Oligocene. He compared eoliths to stone tools that were undoubtedly made by existing Tasmanian *Australoids*, *Homo sapiens* of the Australian Aboriginal sort. He found support from William J. Sollas and Florentino Ameghino.

[265] See Gould and McKay, 130

Archaeologists are ultimately tasked with demarcating human artifacts and natural geodes. This comes down, ultimately, to singling out purposive, intentional action from accidents of nature. This poses problems for atheists of a physicalist or materialist persuasion, because the foundation of such a belief is that humans are themselves accidents of nature and that order and complexity can be found throughout nature as accidents. Archaeology depends on the opposite belief, that nature, left to itself, with the small *n*, does not produce such things as hammerstones or arrowheads. If nature, with the small *n*, could produce these things without an organism, they could not be distinguished from the brute, mechanistic happenings of nature. Instead, Nature, with the big *N*, is required, Nature replete with consciousness, guiding evolution teleologically, providing a purpose from the future of which artifacts are merely the effect. Atheists believe that nature can accidentally form a creature, but it cannot even form a hand axe. These sorts of accomplishments are associated with a "Cognitive Revolution" and intelligent design. A primordial soup cannot produce them, a landslide cannot form them. Some thinkers, such as Terrence McKenna, have posed the idea that the great leap in consciousness attributed to humans, allowing for the development of tools and culture, the *Cognitive Revolution*, had resulted from the use of hallucinogenic mushrooms, which activated areas of the brain previously unused. Others, perhaps more accepted and certainly more mainstream, have suggested that the Cognitive Revolution resulted from the use of grains and tubers and perhaps also from animal fats and proteins. The production of tools required large brains capable of complex sequential thought. Those big brains also learned to provide aid to the sick, one of the most important signs of sapience.

It has been suggested that some otherwise non-human animals have already entered into a sort of Stone Age of their own, and may have been at it for several millennia already. Some of these may even controversially include non-primate animals, such as sea otters, which have been known to use rocks to break open mollusks to get to their meat. But among the primates are White-Faced and Bearded Capuchins— New World Monkeys in Central America and Brazil—, Long-Tailed Macaques in Southeast Asia, and Chimpanzees on the coast of West Africa. Capuchins have been witnessed breaking stones and later using flaked shards, which places their behavior much closer to a Stone Age tool industry. Stones used by Macaques—a Cercopithecine[266] and the most-used primate for expiriments[267]— to crack nuts produce shards similar to early human tools.[268] Chimpanzees have been witnessed by people such as Laura Kehoe engaging in ritualistic behavior, too, such as "accumulative stone throwing" at trees, where they will accumulate stones around a tree trunk from tossing them at it.[269] But what we are looking at seems clear: convergent evolution is taking place, and it is taking place in places not-too-distant from our own points of generation, in Africa, Southeast Asia, and Central and South America.

The *Holocene* is the current epoch that we are in, and, so far, is generally characterized as a warm period or interglacial, having followed the *Younger Dryas* cool and dry stage of the late Pleistocene, the last of three "Dryas" events. Some consider the Holocene to be the latter portion of the Pleistocene. The Holocene begins after the eradication of the Pleistocene megafauna and other lifeforms, and corresponds to the rapid spread of modern humans and the establishment of their civilizations. Humans of the Holocene went from living in small, hunting and gathering bands and clans to developing into tribes, nations, and even empires. They developed animal husbandry, horticulture, agriculture, and industry. The Holocene would begin with the *Mesolithic*, or "Middle Stone Age," the last period of pure hunting and gathering.

---

[266] Family *Cercopithecidae*
[267] A very close relative
[268] Macaques have a similar range to early *Homo sapiens*, from North Africa and Spain across West and into East Asia
[269] Chimpanzees also excel humans at remembering sequences

Of course, I have named only the most relatable of the clades and species, but it must be understood that there exist many extinct species of single-celled organisms, plants, fungi, fish, amphibians, reptiles, birds, and mammals, and that I have not covered the full range in my treatment here, but especially those most pertinent to our story.

Sociality and Agonism

Like many others, humans are animals that practice *sociality*, which is the practice of living cooperatively (mutualistically) in social groups. Species range in their degree of sociality.

Sociality has its origins in parental care, which is a sort of reciprocal altruism,[270] as the immediate costs to the parent are not met by immediate gains. Mammals, defined in large part by their mammaries and live births, seem to have a particularly strong starting point for sociality, though it is also found among birds and insects. Among humans, pair-bonding for purposes of parental investment is quite common and often quite strong, putting humans at the height of mammalian sociality and allowing for a much longer period of growth and development for the offspring. Aside from Bonobos, humans are the only Great Ape that copulates face-to-face, allowing for stronger bonds. While humans of all races do still enjoy "doggystyle," this is more-or-less inescapable for our Great Ape cousins, who almost always copulate this way.

Sociality, or association, evolved for the benefit of participating members. For instance, wolf packs express some degree of sociality in their pack instincts and their group hunting efforts. This is not considered true sociality, however, but pre-sociality, because the wolves do not quite specialize in their tasks or divide things equally, having something more like a tolerance for one another's presence owing to the costs of conflict. Humans, in planning and mutually executing goals, and (when government is not involved) in dividing the gains among participants, exhibit true sociality. Humans, like other Great Apes, have come to associate for survival purposes, similar to herd animals, which herd together for safety in numbers. However, while the extinct Great Ape ancestors of humans might have been preyed upon, humans, in learning to protect themselves, have since gone above and beyond this to become the predator. This owes also to association, which has allowed for planning and execution of hunts,[271] but which developed out of customs for mutual protection. In our associations, we have gone from mates to pairs to troups to bands to clans to tribes to nations and empires. This is all an example of biological sociality.

The most extreme form of sociality is called *eusociality*, and typically involves reproductive specialization, wherein a "queen" will reproduce on behalf of infertile females. This typically involves a high degree of genetic relatedness between the queen and the others, such that the others have a genetic stake in her reproductive success. In insects, eusociality is found especially prominently among the *Hymenoptera* and *Blattodea*, such as the ants, bees, wasps, and termites. Among mammals, some mole rats and marmosets engage in reproductive specialization. We are social animals, but we are not quite eusocial. Humans lack the genetic interrelatedness to make eusociality of benefit, though *polygyny* and *polyandry*—having multiple female or male mates— might approximate some degree of eusociality.

---

[270] Parents give care, while offspring pass the parents' genes along

[271] This may have had some negative consequences for the environment, including the extinction of some megafauna, but the ecosystem ultimately responds by bringing things back toward equilibrium. Nonetheless, humans must concern themselves with whether this equilibrium includes them in it or not, because if they do not make their behavior complementary to the needs of the biological community—mutualistic— they may be succeeded by a better steward that is less prone to parasitism. The role of humans in the ecosystem is as steward.

Social animals exist in the ecology because natural selection favors the options that best preserve the species. That is, natural selection does not merely affect the level of the individual, but also the level of the species as a whole. Because natural selection works according to "chance," it affects the species at-large in terms of averages in selecting for fitness, favoring traits that allow the species as a whole to survive. For instance, strong cooperation or even "altruism" such as heroism can be maintained in a species so long as, in general, the hero can survive, the hero is saving his or her children, or there are more heroes than are needed. And, because those willing to take personal risks in order to preserve the group tend to be favorably socially and sexually selected, survivors are fairly likely to proliferate, and this may help extra to preserve the species as a whole. Further, because a species shares more genetics in common than not, there is a stake in the preservation of the species at-large much as there is a stake in the preservation of one's siblings, though certainly not to the same extent.

Social animals, even while defined by their co-living, are not pure in this respect, and are often aggressive toward one another. *Agonistic behavior*, or *agonism*, identified by J.P Scott and Emil Fredericson, refers to any *social behavior*— that between members of the same species— related to fighting. It can be treated as a sort of economic behavior in so far as participants expect reciprocity (counter-attack) from their actions, and typically results from scarcity of resources, such as food or mates.

Agonism involves three stages, going from threat, to violence, to submission of one of the parties. Submission *may* involve the death of the submitting party, though it most typically does not. In fact, most social animals have a instinct that prevents them from pushing the fight to the death of the other party, particularly when the other party signals admission to their defeat. Their instincts also tend to regulate their agonistic behavior from "foul play" or "war crimes," such as by taking an opportunity to go for a quick kill before signaling a threat. Instead, agonistic behavior tends toward ritualism. For instance, between bucks, there will be a side-by-side march that typically takes place to signal mutual threat and allow sizing-up by both parties. This ritual of mutual threatening may or may not result in submission from one of the parties, though it often results instead in aggression. However, this aggression is not the goring into the side of the opponent when they are not ready. Instead, both parties instinctually agree to clash and push with their antlers only so as not to result in the death of the other party, though this can at times occur. Among canines, agonistic threats come regularly in the form of growling, and violence can escalate from that into snipping or a full-on fight, while submission is acknowledged when the loser rolls to show its belly, which is an act of trust because this is a vulnerable area for attack that could easily lead to disembowlment. Gorillas will beat their chests, make loud vocalizations, and run sideways or jump on things to intimidate and threaten an opponent before any actual violence or submission takes place. One common form of agonistic behavior, or agonistic contest, between males of many species, is *agonistic male mounting*, wherein one male will show dominance by sexually mounting the other. This more-or-less symbolic act of domination serves as a signal that allows fights to the death to be avoided, not entirely unlike a political election (another form of agonstic competition, found among humans), which likewise signals dominance of the victor.

Agonistic behavior is engaged in within a social relationship that makes it unlikely for either party to take the life of another. Otherwise, aggressive behavior would be more greatly limited. In this way, agonism is something like an intraspecific and primordial game that follows instinctually-established rules of engagement so as to allow each party to take part in a non-fatal selection process, most often of an intrasexual nature, a sort of intrasexual selection. True agonism might develop from a prior stage of play-fighting, which itself may at times be sufficient to establish a dominance hierarchy without the need for actual threats or violence later on. Agonism is different from antagonism, wherein there is a

true enemy relationship, as between species, because it is characterized by fair play within the species, particularly between males.

Typically, when fighting does occur in a social relationship, it will be owed to a similarity in capacity that must be put up to "trial by combat" when ritualistic threats do not result in submission by one of the parties, which is actually much more common owing to the risk of injury. The victor agonist is bestowed certain rights or privileges, such as access to food or mates or overall control of a given territory for a given duration of time (such as the length of a season). Agonism is quite often associated with boundaries that are contingent upon defensibility. Along boundary lines, various kinds of relationships can form, including those of what are called *dear enemies*, enemies that are favored over others typically for their familiarity and dependability, allowing for a sort of balance of powers to be established among neighbors, which may become upset by the presence of a newcomer. The opposite effect has also been noticed.

All in all, agonism might be understood as a sort of pre-mutualism or proto-mutualism in biology, as, despite its violent nature, it is nonetheless a social behavior.

Mutualism, Convergence, and Hybridization

Much in evolution functions according to the principles of *economics*, the study of resource exchange. Economics had been described by ancient authors such as Aristotle, among many others, but modern economics would tend to grow from out of the thought of people such as the Physiocrats, Nicholas Barbon, Adam Smith, David Ricardo, and those to come after them, such as Proudhon. Following Proudhon and others such as Herbert Spencer, economics would begin to be applied to natural phenomena outside of human control. Proudhon's social economics, called *Mutualism*, would become a foundation in biology and ecology. *Mutualism* is a term used today in biology and ecology as well as in socio-economy, and in both the natural and social sciences it refers to the same kind of reciprocal behaviors.

According to Judith L. Bronstein, in *Mutualism*, Pierre-Joseph van Beneden, the originator of the label in biology (and opponent to Darwinism), defined *mutualism* as "'mutual aid' among species."[272] This was well after the famous Mutualist philosopher, Pierre-Joseph Proudhon, had popularized the concept of *Mutualism*. *The Encyclopedia of Evolutionary Biology*, edited by Richard M. Kliman, presents Proudhon as an advocate of Mutualism before introducing van Beneden's concept of biological mutualism, such that we are led to conclude that van Beneden had been referencing Proudhon's vision.[273, 274] Jan Sapp's *Evolution by Association: A History of Symbiosis* likewise makes mention of Proudhon's Mutualism before introducing van Beneden, going as far as to say that "[Douglas] Boucher suggests that the use of the term 'mutualists' itself may well have evoked thoughts of Proudhon and the mutualists of the Commune repressed only a few years earlier."[275] The concept of *biological mutualism*, that is, was described after the popularization of philosophical Mutualism, with the big *M*. Big-*M* Mutualism, as a human societal ideal, being self-aware of its practices and willing to universalize them, can be considered a practice of *conscious mutualism* (a corollary of "conscious evolution"). Conscious mutualism is the conscious engagement of biological mutualism. The otherwise unconscious or instinctual practice of biological mutualism, made conscious, is capable of accelerating, and tuning for

[272] Bronstein
[273] Also involved in the topic was another concept, the "economy of nature," as presented by Linnaeus
[274] See Kliman, 273
[275] Sapp, 18

an intensified frequency of mutualism. Conscious mutualism produces Mutualism.[276] But we're still working at it! That's what evolution is all about.

In ecology, *mutualism* is contrasted to *parasitism*, in which one organism exists at the obvious expense of another; and *commensalism*, in which an organism may benefit from another without causing obvious harm. Mutualism, parasitism, and commensalism are all examples of *symbiosis*, or close interspecific[277] relationships. Carol L. Landry, in "Mighty Mutualisms: The Nature of Plant-pollinator Interactions," in *Nature*, and citing Bronstein, says that "[m]utualistic interactions are mutually beneficial species interactions," and that "[m]utualistic interactions" involve "the exchange of goods or services between two species, called mutualist partners." She says that, "by definition," "each species involved in a mutualism must receive a benefit from the interaction, and," she says, "that benefit usually comes at a cost." But, she makes clear that

> While the activities of each partner benefits the other species in some way, neither species behaves altruistically. Instead, each species pursues its own selfish interest, and any benefit incurred by the mutualist partner is an unintended consequence of the interaction.[278]

Mutualism is found across the animal kingdom and in the world of biology more generally. For an instance of mutualism, know that it is common to find little birds, such as oxbirds, associating with ungulates such as a rhinoceros or cattle. The birds eat the ticks and other parasites that bother the ungulates, providing the ungulates with relief while living on them. Meanwhile, the ungulates supply the demand for blood that keeps the pests coming back, thereby securing food for the oxbirds. A similar relationships occurs in the ocean among sharks and pilot fish, who eat the parasites from the sharks and in return receive protection from other large fish and an ample supply of food. Herodotus gave one of the earliest descriptions of mutualism when he described "natural dentistry" when crocodiles of the Nile River opened their mouths to allow sandpiper birds to eat leeches from out of them, thereby feeding the birds and maintaining the wellbeing of the reptiles. But mutualism is not limited to fish, birds, reptiles, and ungulates. It can also be found among plants, fungi, and even bacteria. Spruce trees, for example, and among other trees, communicate through an "internet" of mycorrhizal fungi, providing carbon to one another when one is low and another is high in it. In return, the fungus receives products from the *photosynthesis* of the trees, the production of sunlight into caloric energy. Other plants, among them trees such as the locusts, of the legume variety, house bacteria in the nodules of their roots that produce ample amounts of fertilizer in a process called *nitrogen fixation*. Mutualism is a part of life. It makes a perennial appearance throughout unrelated circumstances, displaying itself as an expression of sociality, co-evolution, hybridization, and convergent evolution.

In ecology, it is common for mutualism to express itself in the form of *guilds*, groups of different types of organisms that co-benefit each other.[279] As suggested by Jason D. Hoeksema and Mark W. Schwartz, in *Economics in Nature*, edited by Ronald Noe, Jan van Hooff, and Peter Hammerstein, mutualistic relationships, or "mutualisms," "have been modeled as biological markets,"[280] and

> are characterized by complexity and variation, with multiple, varying individuals and species on both sides of the interaction, species engaged in multiple types of

[276] In the sense of conscious mutualism, *Mutualism* refers to the reciprocity of rights and obligations
[277] *Interspecific* means "between different species"
[278] Landry
[279] Interestingly enough, the human social movement, of Mutualism, also arose from guilds, but, in this case, craft guilds
[280] Noe, van Hooff, and Hammerstein, 173

> mutualisms simultaneously, and costs and benefits of the interaction changing over time and space. Biological market models address this complexity in a number of ways, and as such may be appropriate for modeling many types of mutualistic interactions. The central mechanism of market models is that the price of trade is negotiated, with individuals choosing partners who are offering the best price. This partner-choice mechanism incorporates variation among potential partners in a mutualism, and recognizes that mutualisms operate in a complex community context.
>
> Many mutualisms may be best seen as interactions in which individuals of one or both species exploit individuals of the other species, but that nonetheless result in net benefits to each of the individuals involved.[281]

They say that the "interaction is considered a mutualism if the benefits and costs involved add up to a net benefit for both species."[282] The biological markets in question contain such interactions as those between "males and females, breeders and helpers, or plants and pollinators," suggests Ronald Noe.[283] Boguslaw Pawlowski and Robin J.M. Dunbar tell us that, among humans, "[m]ales offer cues associated with resources and seek out attractiveness, whereas females offer attractiveness and seek cues associated with commitment and resources."[284] Of course, similar dynamics of give-and-take, even while not sexual, are at play between the desires of friends and associates, family members, and etc.

Technically, *mutualism* in biology refers to win/win relationships between organisms of different species or populations, while *cooperation* refers to mutual or reciprocal arrangements between members of the same species. However, it is not uncommon to group the two together. Like mutualism, cooperation can be found widely in the animal kingdom and beyond. It is especially prominent where kin selection is advantageous, for purposes of ensuring the security of one's own genes, even if indirectly, but can occur merely for economic reasons as well. Many animals, for instance, will sound an alarm when a predator is sighted or starts to attack. Chickens, for instance, both hens and roosters, will sound such an alarm. But in so doing, they are making themselves vulnerable to attack by drawing attention to themselves. Nonetheless, this sort of cooperation pays off because it provides the flock at large more safety, thereby securing the safety of the chickens' kin. The same kind of dynamic plays out with animals such as ground squirrels. Cooperation is also seen among some of our closest relatives, such as the chimpanzees. Chimpanzees form *fission-fusion groups*, meaning that the members come and go from the *troop*, the chimp group, which may be organized along the lines of sexual economic specialization with males hunting and patrolling the territory and females nursing the young and foraging, and within these troops coalitions may be formed. Chimps are known to regularly groom one another, and Bobobo Chimpanzees are known to be very promiscuous, even trading sexual favors as commodities.

Mutualism, or—as is more technically phrased within intraspecific[285] relationships— *cooperation*, is especially noticeable among humans. It's less noticeable among our non-human primate relatives. Michael Tomasello, in his *Why We Cooperate*, says that there are "fundamental differences between human children and apes," and that "human children are altruistic in ways that chimpanzees and other great apes are not."[286] Tomasello here does not mean *altruism* in a fundamental sense, of course, as Landry suggests against, as that would be inconsistent with biology, but in the sense of what biologists

[285] Meaning "within the same species"
[286] Tomasello, 104

refer to as *reciprocal altruism*, distinct from true altruism. Reciprocal altruism is nothing to scoff at, though. As Carl Zimmer says, in *Evolution: The Triumph of an Idea*, Great Apes such as chimpanzees make a major use of it:

> Reciprocal altruism may be particularly likely to evolve in species with big brains. If you have the mental capacity to recognize individuals and keep a scorecared of who has been good to you and who has been taking advantage of your kindness, you can use reciprocal altruism to your advantage. So it shouldn't come as a surprise that some of the best evidence for animals helping strangers comes from our closest relatives— chimpanzees and bonobos [...]
>
> Chimpanzees cooperate with unrelated chimps, do favors for them, and sometimes even make sacrifices for them. They may join together on hunting expeditions, loking for duikers or colobus monkeys and sharing their kills. Reciprocal altruism may help chimpanzees gain social power—two subordinate males, for example, can make an alliance to overthrow the top male in their group. And chimpanzees do not just hand out favors blindly. They keep track of their kindness, and if they are betrayed will cut off their generosity or even punish a cheating chimp.[287]

This sort of reciprocal altruism is also well at play among humans. Much of the reciprocal altruism between humans is instinctive, but it is also dependent upon mutual understanding. For instance, Tomasello says that human children "form with others joint goals," and that

> they establish with others domains of joint attention and common conceptual ground, and they create with others symbolic, institution realities that assign deontic powers to otherwise inert entities. Children are motivated to engage in these kinds of collaborative activities for their own sake, not just for their contribution to individual goals.[288]

Shared conceptual ground, to such a degree as we have it, seems unique to human beings. Cooperation and mutual aid are basic components of human life, however, and Tomasello's work comparing the behavior of human children and young primates demonstrates that they are fairly innate. Tomasello says that he does "not believe [reciprocal] altruism is the process primarily responsible for human cooperation," but that, instead, "altruism is only a bit player. The star is mutualism."[289] He says that "mutualism might also be the birth-place of human altruism: a protected environment, as it were, to get people started in that direction."[290] Of course, Tomasello is not talking about Mutualism with a big *M*, but of small-*m* mutualism; biological mutualism.

Mutualism, like biological evolution as a whole, owes its being to the syntropic element in Nature. However, mutualism must progress at the benefit of the individuals whose subjectivity has been separated in the entropy of the Universe.[291] While all forms of association or symbiosis are syntropic to some extent, not all forms are necessarily mutualistic, as some can be parasitic and syntropic only for a parasite within the association, being entropic for the host. For this reason, in mutualistic relationships, individuality and self-interest cannot be forsaken for the collective or for altruism, despite their foundations being ultimately sourced in separation (and so in the context of entropy). Mutualism proceeds as reciprocal benefit from association is found. In this respect, mutualism represents a momentary balance of individualism and collectivism, as well as entropy and syntropy. Another way to

[287] Zimmer, 252
[288] Tomasello, 105
[289] Tomasello, 52
[290] Tomasello, 53
[291] Subjectivity owes to a difference, which is due to to separation, which is because of entropy

put this may be that, while mutualism progresses toward a sort of absolute syntropy, it does so as the relative balance of entropic and syntropic interests.[292] To imagine this, one must understand that relative syntropy and entropy are like relative good and bad, wherein what is good to one is bad to another, and *vice versa*; while absolute syntropy is like absolute Good, the absence of relative bad. This cannot be achieved by way of parasitic association, which necessarily inflicts entropy on others in order to have syntropy for itself.

A very important expression of mutualism in biological evolution is called *co-evolution* or *parallel evolution*. This involves a close relationship between two species, oftentimes belonging to entirely different kingdoms, phylums, or orders, such that they begin to evolve to accommodate or complement one another. A famous example of this comes from Charles Darwin in his *Origin of Species*, wherein he describes the co-evolution of a flower and a pollinator, particularly clover and bees. He imagines the extinction of bumble bees, which pollinate common clover, leading to a surplus that might be taken up by a new pollinator, the honey bee. The bumble bee has a long tongue to get to all of the clover's nectar, but the honey bee does not. However, in absence of a strong competitor like the bumble bee, and with a plethora of nectar made available to it, any honey bee born with an extra long tongue might see those genes pass on (by way of related drones or a queen, perhaps) to its hivemates, to their heightened success. Further, clovers that made their nectar more available to their new pollinator friends would likewise see success. In this way, mutualism leads, in the march of co-evolution, to advantages for both parties. This led Darwin to say, as popularly quoted, that

> I can understand how a flower and a bee might slowly become, either simultaneously, or one after the other, modified and adapted in the most perfect manner to each other, by continued preservation of individuals presenting mutual and slightly favorable deviations of structure.

While a great deal of co-evolution is mutually beneficial, it also expresses itself, at times, in mutual struggle. For instance, the cheetah and the gazelle represent an antagonistic sort of co-evolution not built on mutualism but instead on predation. Nonetheless, the co-evolution of the cheetah and the gazelle leads both to increase their speed, the cheetah for purposes of predation and the gazelle for purposes of survival. So while this is not generally classified as biological mutualism, there is still some degree of genetic mutualism at play in their conflict. Mutualism, by the way, might span the range from mutually-beneficial competition to collaboration. Sometimes domestication, as is done by both ants and humans, is considered to be a form of mutualism, though it seems to be some fuzzy ground between predation, domination, or exploitation and mutualism, as we will see is also the case with human governments. Another example of parallel evolution is grazing animals and flowering plants, another relationship based on mutually-strengthening competition.

Co-evolution might be seen among humans especially culturally, as with division of labor and specialization in the economy, wherein people develop different but complimentary skills, but also in competition between those sharing in the same industry or between businesses or nations, especially when their relationships are intergenerational. There may be some degree of co-evolution involved, also, between human racial groups. For instance, in medieval Europe, it was common for Jews and Gentiles to perform different economic functions. However, where co-evolution is not mutual, it may be commensal or parasitic, which has been the case when royals distinguished themselves in parasitic relationships or when free riders plague a society.

---

[292] This is difficult to conceive of geometrically in three dimensions, but is likely not to be so difficult for God, in the fourth. However, to understand this relationship between the relative and the absolute is one of the heights of philosophical and alchemical achievement.

Mutualism seems to be convergent or hybridizing in some respects, too. That is, mutualism doesn't generally seem to have a clear or singular starting place, so much as being something that unfolds from within different individuals in different circumstances. Sometimes these individuals find one another and, in the case of humans, do something with their insights, sometimes hybridizing or— especially in humans— forming unique traditions or institutions of conscious mutualism. Other times, they express similar characteristics, completely separated from one another. Mutualism has many starting places. Considering our lack of specific knowledge in regard to the origins of mutualism, it may be best to treat it as an outgrowth of instinctual or habitual, as well as semi-conscious mutuality that has been ingrained in ours and others' species. Instinctual and semi-conscious mutuality presents a common environment for varying attempts at conscious mutualism, originating from different points of origin, and having different perspectives. These points, at times, come together to establish something shared between them.

In evolutionary biology, it is not unheard of for very similar traits to evolve independently of one another, often owing to similar environmental circumstances, a phenomenon known as *convergent evolution*. Erica R. Pianca, in "Convergent Evolution," tells us that "[c]onvergent evolution is the process by which unrelated or distantly related organisms evolve similar body forms, coloration, organs, and adaptations." She says, "[n]atural selection can result in evolutionary convergence under several different circumstances."[293] The eye, for instance, is understood to have independently evolved in different organisms; wings as well. Warm-bloodedness developed separately and convergently in the ancestors of birds and mammals.

As it regards taxonomy or phylogeny, the relationship between species can be either *monophyletic*, in which case they are considered to come from a common ancestor, or *polyphyletic*, in which case they are classified according to similar morphology even if arising from convergent evolution. Within monophyletic arrangements, there can also be *paraphyly*, or species set apart from others in the clade. For instance, according to mainstream scientists, prosimians have a paraphyletic relationship within the larger monophyletic arrangement of the order of primates, while lorises and tarsiers are considered to be polyphyletic, due to being classified separately within the prosimians as belonging to different ancestors. Of course, this is assuming a neo-Darwinist framework in which genetic drift is the driving force of evolution, in which case convergence is not seen as playing a central role.[294] Algae is polyphyletic, as is *Edantata*, which contains Xenarthrans such as sloths, anteaters, and armadillos as well as non-Xenarthran aardvarks and pangolins (who are apparently more closely related to carnivores). These animals, like the algaes, are considered to be so similar that they were originally given monophyletic classifications together. Yet, they are now considered to have come from different ancestors, despite their close affinities.

Many animals have polyphyletic relations. Bats have a polyphyletic relationship to treeshrews and primates. Ringtail Coatis and raccoons share a superficial resemblance to Lemurs and Ringtail Possums. Fairy armadillos are apparently armadillos, though they have many characteristics in common with moles, and appear to be armored moles. The Harpy Eagle and the Phillipine Eagle are

[293] Pianca

[294] From a hard position of strong convergent evolution it may be argued that another sort of category might be due, which recognizes convergence from completely separate origins, *a la* the shadow biosphere. If I may, I'd like to coin the term *henophyly* for a polyphyletic dynamic that is only distantly, or not at all, genetically related at its foundation, but especially when regarding a hypothetical hybridization between these species of nonexistent or distant relation, and, in particular, through sexual reproduction. Such a term would describe, for instance, a hypothetical hybrid between New World and Old World monkeys, something which is, so far as I am aware, yet to be demonstrated as possible, though it may theoretically be considered.

very similar, even having been classified together as the same species, *Pithecophaga*. The African Crowned Eagle is likewise considered to have convergently evolved similar characteristics to the Harpy Eagle. Legless lizards and snakes look very similar, but are only distantly related.[295] *Carcinisation* refers to the process of non-crab crustaceans becoming crab-like, a process so common that it demanded its own name! L.A. Borradelle, who coined the term, described it as Nature's many attempts to evolve a crab. Similar observations have been made about turtles and creatures that evolve similar shells along different evolutionary pathways.

Marsupials seem to tie many of the other mammals together polyphyletically. There are some marsupials that appear bearlike—most notably the Koala—and even primate-like, such as the Lemur-like Ringtail Possum and Greater Glider of Australia, or especially the Cuscus of New Guinea, which had, according to Gould and McKay, originally been mistaken for monkeys by Europeans.[296] Meanwhile, the Tasmanian Tiger, another marsupial, appears quite similar to a wolf in transition from an earlier therapsid. Morphologies span across the placental-marsupial divide in many mammals, suggesting that divergence and convergence occurred multiple times, among many species of animals. For example, as pointed out by Jenkins,[297] the morphology of a placental wolf, *Canis*, can be found among the marsupial *Thylacinus*, the placental shrew, *Sorex*, is mirrored by the marsupial *Sminthopis*, *Tamandua* by *Myrmecobius* anteater morphs, and *Talpa* by *Notorcytes* mole morphologies. Put more simply, there are both placental and marsupial versions of (at least) wolves, shrews, anteaters, and moles. The transition of multiple species from one form to another suggests a high likelihood for convergence having had taken place.

Evolutionary convergence is not as uncommon as one might think. And it's not restricted to simple biology, either. Convergence also occurs on a cultural level, when inventions or innovations of a common type emerge around the same time, by creators who are completely unaware of each other's work. This phenomenon is known as *multiple discovery*.[298] Convergent evolution can also take place on a massive scale. For instance, *adaptive radiation* is a concept that is used to explain the convergent evolution of marsupial and placental mammals.

Convergent evolution has even been demonstrated to occur on the molecular level and cellular level. As George McGhee, in *Convergent Evolution: Limited Forms Most Beautiful*, tells us

> Since DNA and RNA molecules contain only four separate nucleotides, the code for Earth life is a base-four system. As such, the probability [...] of convergent molecular evolution of the same nucleotide at the same site in two different DNA and RNA molecules, via random mutation, is one in four. Protein molecules contain only 20 different amino acids: thus [...] one in twenty."[299]

Further, McGhee reports, "Proteins are complex molecules, and the function of the protein is often determined not only by its amino acid composition but also by the complex manner in which the protein is folded [...] one in five hundred to one in a thousand."[300] McGhee cites a large number of examples of convergent evolution, including on the level of cells and tissues, such as in the form of microtubules. He concludes that "convergent evolution occurs across the entire spectrum of molecules

[295] Some snakes are also known to have live birth, an example of reptilian convergence with *Mammalia*
[296] See Gould and McKay, 57
[297] See Jenkins, 175
[298] Herbert Spencer was an early proponent of this view, in contrast to the *Great Man* view of history
[299] McGhee, 177
[300] McGhee, 177

that make up life."[301] He also ponders the question of convergent minds, just as Herbert Spencer had touched on long ago in his concept of *multiple discovery*. McGhee especially points to architectural strategies that have developed in common between different species, but also to such things as art, herding and pack-hunting behaviors, and, importantly, the convergent evolution of cultivation and husbandry practices found in common between certain ants, humans, and some beetles. Among the human species, it has been argued, pyramid construction is similarly understood to have converged, owing to the physical constraints shared by people in disparate locations.

Similar in some respects to convergence is *hybridization*, when organisms of differing types mix or coalesce. They are similar in that different starting places come together. The difference is that convergence does not require a physical coming together like hybridization does, but represents similar, though separate ends reached. For the most part, hybridization occurs within the same genus, though there are claims supported by documented evidence such as photos, video, and testimony of crosses happening between species of different genera, family, and even order. The trustworthiness of some of the latter begs the question at times. However, Eugene McCarthy has compiled an impressive mass of evidence in favor of the idea that hybrids are not always infertile, even if they differ vastly in their chromosome count, and that human evolution might involve more than just primates in its somewhat recent family tree. In *The Hybrid Hypothesis*, for instance, Eugene says that "it appears that humans are the result of multiple generations of backcrossing to the Chimpanzee." *Backcrossing* is a practice of intentional breeding, wherein a farmer will breed a parent to its offspring in order to preserve the desirable traits of the parent, and is known to be effective when utilizing hybrid offspring. In this way, a carrier animal of lesser importance may be used to transfer a parent's genotype and phenotype to a later generation. Eugene says that

> the other parent in this hypothetical cross that produced the first human would be an intelligent animal with a protrusive, cartilaginous nose, a thick layer of subcutaneous fat, short digits, and a naked skin. It would be terrestrial, not arboreal, and adaptable to a wide range of foods and environments. These traits may bring a particular creature to mind.[302]

It's the pig. Yes, the pig. A commenter on McCarthy's paper, Bryan Goldstein, says "I think I just became Kosher." McCarthy considers a chimp-pig cross to have resulted in the gorilla in a similar process.

The pig, McCarthy points out, has even more of the characteristics that non-human primates don't have even besides these. McCarthy also points out that hybrid species can be backcrossed by way of *introgression*, which is a long-term process involving repeated backcrossings to pass genes from one species into the gene pool of another. A particularly extreme form of this is called *lineage fusion*, and involves introgression that merges two species or populations into one. That's not all, McCarthy lists, in *Mammalian Hybrids*, those crosses, both human with animals and animals with other sorts, which appear to be most likely. He catalogs these not according to genetics, which is actually his expertise, but according to number of reliable reports of occurrences. At the top of the human-animal crossbreed report is a human-pig cross, for which numerous examples, including photos and videos from different areas of the world and testimonies published in fairly reliable publications, are provided. The pig is followed in McCarthy's reliable reports list by domestic farm animals and dogs, and then chimpanzees and orangutans. About halfway down the list of reliability is the human-snake cross, while a human-rabbit cross is at the lowest end of those reported. He lists many interspecific animal crosses in his

[301] McGhee, 206
[302] McCarthy[1]

work, too, among them the *Bili Ape*, a chimp-gorilla cross he thinks, but which is considered to be a new species of chimpanzee by the mainstream.[303] The Bili Ape was documented by Shelly Williams, who was shot in the back during her work. These are suggested to be six-foot-tal, bipedal apes with a fairly large braincase.

It must be noted that hairlessness is not a trait exhibited in all pigs, especially Eurasian pigs, but more particularly in domestic pigs. Wild hogs and boars have very coarse black or brown hair). The degree to which this is an emerging or convergent similarity between pigs and humans is not thoroughly explored by McCarthy to my knowledge, though he does explain that we are not sure what the ancestor of the domestic pig were like for sure, and that other sorts of pigs such as the tusky and hairless Babirusa could have made their way into the mix, otherwise demonstrating a possible analog. Perhaps, rather than purely receiving all of these traits one from the other, though, they either separately converged or co-emerged as a result of the sort of hybridization that McCarthy describes. After all, if the idea described is that macroevolution requires beastiality across family, genus, phylum, and order, and incest by way of backcrossing—going against universal human taboos—, then the idea is already that hybridization drives evolution. But, need this evolution be merely limited to the sexual-physical exchange of existing traits, or might emergence, driven by syntropy and informed by a morphogenetic field, play a role in developing novel and new traits from genetic synergy? Another possibility is that beastiality and incest is actually not needed at all (though they may assist), but that there may be periods wherein rates of horizontal gene-transfers are accelerated, allowing genes to be transferred non-sexually. In Scott Simon's "Understanding Horizontal Gene Transfer in 'The Tangled Tree,'" for instance, David Quammen says that

> The tree of life is the model used because it shows branches diverging. But now we understand that innovation in genomes doesn't always come gradually. Sometimes it comes suddenly, in an instant, by horizontal gene-transfer. And that represents the convergence, not the divergence, of lineages.[304]

It seems that macroevolution must be driven by syntropy (and so is not really *e*volution at all, but just volution), and that this entails that very different creatures are becoming more similar in this way. Perhaps, then, being "made in the image of God" might mean that together, despite our different starting points, we've developed similarities due to sharing the same *telos*, and that all creatures are developing together toward a more perfect form, of which *Homo* is merely a stepping point, but one which is or will be shared by all in increasing intensity on the way back to the Source. Indeed, Graem Finlay, in "*Homo Divinus*: The Ape that Bears God's Image," describes humanity's being "made in the image of God" as— not simply referring to our capacity for rational thinking and creative endeavors, but— the evolved capacity to relate to God, the whole cosmos, and the entire human family.[305] *Homo divinus* refers to Graem's conception of humanity, an ape that has come about by way of God's plan, as revealed in evolution, that reflects God's image. While Graem is not likely to agree with multiregional or polygenic evolution, his concept of *Homo divinus* nonetheless describes what the end result of a convergent, hybridized evolutionary path might lead to.

While George McGhee seems wedded to the standard models of physics and geology— or his studies on convergent evolution would probably push more weight around (such as by standing in support of such hypotheses from a polygenic basis)—, there is still something quite revolutionary in McGhee's work

---

[303] See McCarthy[2]

[304] Simon

[305] He later points to the role of Christ in playing the image of God. This is a role we might remember Jesus himself suggesting belongs to the Church, which is the body of believers.

beyond his collection of data regarding convergent evolution. He has the gall to step into the world of philosophy a bit, into the arena of futuristic astrobiology. In this, he echoes Giordano Bruno in suggesting that the exoplanets are populated by other beings, and in so doing implies the possibility that these other beings may be something like us. Could they possibly even be *Homo sapiens*? McGhee's book is based on the premises that possibilities for forms are limited by the laws of physics, producing "forms most beautiful," a corrective to Darwin's assertion that such forms were endless rather than limited.

Archaic Primates

Paleoanthropology combines insights from paleontology, physical anthropology,[306] and *archaeology*, the study of human artifacts, to provide insights into the lives of people from the very distant past. There have been many people involved in this endeavor throughout time. Getting even further back in time requires an exploration of *primatology*, the study of primates, a subcategory of *zoology*, the study of animals more generally. Carl Linnaeus gave humans the taxonomic classification of *Homo sapiens*, recognizing two European types—*europus* and *alpinus*—, and assumed a common origin with apes, suggesting that humans were in fact simians. He had another form of human in his taxonomy as well, *Homo troglodytes*, or "cave man,"[307] derived from Jacobus Bontius, who had described it. Bontius had also introduced the word *Orangutan* from Asia. A third, *Homo lar*, would later be identified by others as a Gibbon, the Lar Gibbon. Philippe-Charles Schmerling discovered *Neanderthal*, a human who lived before and during the time of the earliest modern humans, but thought it was a modern human, while Johann Carl Fuhlott distinguished Neanderthal from modern human bones. Hermann Schaaffhausen studied Fuhlott's Neanderthal bones. People such as Rudolf Virchow, resistant to evolutionary thinking, argued that Neanderthal characteristics were due to pathology.[308] Julien Fraipont, a student of Van Beneden, argued that Neanderthal was a legitimate species. Thomas Huxley suggested that Neanderthals and modern humans had hybridized some. *Australopithecus* was found by quarry workers and studied by Raymond Dart. Eugene Dubois was the first to seek out human fossils, discovering Java Man, or *Pithecanthropus* or *Homo erectus*, in Indonesia. Rhodesian Man, an African *Homo heidelbergensis*, or *Homo rhodensiensis*, was found by Tom Swiglar and studied by Arthur Smith Woodward. Ralph von Koenigswaldi discovered *Gigantopithecus* and *Meganthropus*. After a visit by the Swedish Prince in China, Johan Gunnar Andersson would announce the discovery of human teeth from Peking Man that would be categorized later as belonging to *Homo erectus*. *Homo habilis* would be discovered and studied by the Leakey family, namely Mary, Louis, and Richard. In between these there would be many more discoveries, some new and others belonging to the same *taxa*, and upon all of these would be established new models of human evolution.

Graecopithecus, discovered in Greece and then analyzed by Nikolai Spassov and Madelaine Bohme, among others, is a strangely controversial species. The controversy lies in its being in the East Mediterranean rather than in sub-Saharan Africa, the politically-correct home of humanity. As such, it may be able to shake the Leakeys' hegemony and establish a new model more related to an Out of Europe view. After all, Ales Hrdlicka long ago suggested that the locus of human evolution is in Central Europe. *Graecopithecus* appears to be a strong contender for our common ancestor with Chimpanzees,

---

[306] The study and classification of humans according to physical type

[307] Also called *Homo sprelaeus*

[308] *Pathology* comes from *pathos*, which is a word referring to appeals to the emotions as well as to suffering more specifically. Similarly, pathology is the study of ailments resulting from absurdities that have led to suffering, *absurdities* being attempts to do what is impossible. When one tries to do what is impossible, it is an absurdity, and absurdities are what lead to *pathos*, suffering resulting from appeals to the emotions. Judgement not rendered according to natural fact causes natural suffering. This is the nature of pathology, whatever the scale.

thought otherwise to have been a species such as *Proconsul*[309] that ties together the Lesser Apes, or the gibbons, with the Great Apes. *Graecopithecus* was related to *Mesopithecus* in Southeast Asia and probably the other Australopithecines, or proto-humans, throughout the world. Today, the Common Chimpanzee, including *Pan trogdolytes versus* in West Africa, are found just South of the Sahara Desert. They are separated from the Bobobo Chimpanzees, or *Pan paniscus*, by the Congo River to the South, and sometimes border or even overlap with the habitat of gorillas. Remember, on a smaller planet, this would not have been too distant from *Graecopithecus* in the Balkans, which would have touched North or perhaps even Western Africa (if Eurasia slid Eastward), otherwise having a land bridge there by way of Africa, Italy, and Iberia.

Paradolichopithecus was a baboon- or macacque-like primate from Eurasia that is thought to have stood upright, having features similar to *Australopithecus*. *Danuvius* was another, older Great Ape, that lived in Germany, and walked upright or close to it by way of clambering (as a Orangutan does, but more advanced). Other European apes have also been discovered in Europe, such as *Anapithecus* and *Griphopithecus* from Austria, *Dryopithecus* from France and Spain, *Rudapithecus* from Central Europe, or *Anoiapithecus* or *Pierolapithecus* from Spain, *Ouranopithecus* from Greece, among others. Europe was not at all foreign to apes. Today, however, only the Barbary Macaques, a type of Cercopithecine, remains in Europe.

Aegyptopithecus, discovered by Elwyn Simons in Egypt, and which predates the split between apes and Old World Monkeys, is a primate that has been compared to New World Monkeys, being similar in size to a howler monkey. This is interesting because there are some New World Monkeys that are similar in some respects to Old World Monkeys or apes too, such as *Perupithecus*, *Proteropithecus*, and *Protopithecus*, the largest of the New World Monkeys,[310] and also among the least well-known. *Perupithecus*, discovered by the team of Kenneth Campbell, Jr., is considered to possibly have been the first of the New World Monkeys, although it is conjectured that it is of closer relation to Old World Monkeys and is met with competition by *Panamacebus, Paralouatta*, and *Ucayalipithecus*, among others typically also of a squirrel or howler monkey morphology. As the story goes, *Perupithecus* or something like it crossed the Atlantic from Africa and the New World Monkeys are its derivatives. Of course, others, such as Carelton Coon, supported convergent evolution as an explanation. *Proteropithecus*, first described by Cuvier,[311] was found in France.[312] The team of Carlos Jaramillo, however, discovered *Proteropithecus* also in Columbia, now called *Branisella* after Leonardo Branisa who discovered it also in Bolivia, though Terry Harrison suggests it has also been found in Argentina. Among others, Richard F. Kay still suggests that *Branisella* is *Proteropithecus*. *Protopithecus*, not to be confused for *Proteropithecus*, is often cited as the "first fossil primate" owing to its having been the first extinct primate fossil discovered, by Peter Wilhelm Lund. It appears to have been something like a hybrid between the ancestors of howler monkeys and spider monkeys, or to have been derived from a common ancestor of the two. Its limb bones are twice as thick as spider monkeys and it appears to have been able to howl like howler monkeys due to its large vocal sac. Its large size may be suggestive of a semi-arboreal or semi-terrestrial lifestyle, living between ground-level locomotion and time spent in the trees, so Lauren Halenar, in "Reconstrucing the Locomotor-Repertoire of *Protopithecus brasiliensis*," has suggested that it may have occasionally spent time on the ground similar to the Great Apes.[313] Brazil, at the time, may have alternated between savannah and jungle, contributing to a generalizing

[309] Perhaps a Cercopithecine or derived therefrom
[310] But *Branisella*, *Cartelles*, and *Caipora* are also similar in some respects to Old World Monkeys
[311] In his "Research on the Fossil Bones of Quadrapeds"
[312] In gypsum quarries at Montmartre in Paris
[313] See Halenar

species that could alternate between arboreal and terrestrial living, she suggests. New World paleontology and archaeology are sorely lacking, as the Amazon rainforest, upon being scanned by technology, shows that a vast civilization awaits to be explored beneath the thick jungle. Because the Americas do not fit into the official narrative, they—especially South America—are lacking in funding for expeditions to do things such as search for extinct apes and monkeys, or even cities for that matter. Still, Hazel Byrne, et al. have shown that humans are some relation or show resemblance to Plathyrrine, Cebideae monkeys,[314] the group containing capuchins, spider monkeys, and, depending who you ask, howler monkeys.

Many religionists and fringe archaeologists believe that there is a concerted effort by institutions such as the Smithsonian and the Vatican to hide away the true history of humanity. Perhaps an example of this, Regin Olimberio writes in "*Megatherium* or Extinct Giant Sloth Built Huge Complex Tunnels in Prehistoric Brazil, But Why?" that there are giant tunnels, called *paleo-burrows*, under Brazil that were created by *Megatherium*, the Giant Ground Sloth.[315] This required construction by multiple generations, required planning skills, and perhaps tool use. Paleo-burrows used to be called *underground galleries* even in the mainstream, relay Fabrico J. Nazzari Vicroski and Heinrich Theodor Frank in "The people of the paleoburrows assigned to Pleistocene megafauna in Southern Brazil," but have since been classified as *paleo-burrows* due to their antiquity. Some of them have cave paintings and ceramic artifacts in them, but Vicroski and Frank assure us that this is because humans started using the paleo-burrows after their having been abandoned by megafauna.[316] Ground sloths have certainly been found in caves, lava chutes, fumaroles, or etc. A Shasta Ground Sloth, *Nothotherium shastensis*, for instance, not quite as large as a Giant Ground Sloth, *Megatherium*, was found in a fumarole, a volcanic tube, of Aden Crater in Southern New Mexico. Jay Sharp, in "Shasta Ground Sloth, *Nothrotheriops shastenensis*: The Story of Its Discovery at Aden Crater in New Mexico," writes, "[a]stonishingly, the sloth had broken none of its bones in its fall into the fumaroles,"[317] which falls about a hundred feet below the surface. It was in a large, dry room or chamber, Jay reports, that had since been occupied by bats and the remains were well-preserved in guano. *Shastensis* is named after the Mount Shasta area, where it was originally found in caves at Potter Creek.[318] The problem is, sloths are notoriously slow creatures, owing to their exceptionally slow metabolism, although *Thalassocnus*, a semi-aquatic ground sloth, likely had some sort of speed to its motion. And there is no existing evidence of their having been able to use tools. Today, sloths are around the size of primates and are found in South America. The two main types, two-toed and three-toed sloths, despite their similarities, are considered to be products of convergent or parallel evolution, understood even by the mainstream to have come from different creatures![319] On the more extreme end of convergent evolution, it is not entirely impossible (though it is unlikely) that the Giant Ground Sloth had evolved, like the sea otters perhaps, separately from primates or after introgression or backcrossing into their own Stone Age.[320] It seems most likely, however, that these tunnels were actually built by a Hominin, and probably by a

[314] See Byrne, et al.
[315] *Megatherium* is understood to have co-existed with humans and probably to have been prey to them
[316] See Vicroski and Frank
[317] Sharp
[318] The Shasta Sloth is the most prevalent sort found at the famous La Brea Tar Pits, as well, which have preserved a large number of prehistoric specimens, including Saber-Toothed Cats, or *Smilodon*, and many others (bison, mammoths, bears, wolves, etc.). Harlan's Ground Sloths, *Paramylodon*, were possibly hunted in New Mexico not too far away at White Sands, as indicated by preserved human footprints from the Middle Stone Age following after those of a ground sloth.
[319] Despite their similarities to primates, they are considered phylogenetically more related to armadillos and anteaters than to lemurs. Little is known of their hybridization capacity.
[320] Even wilder is the possibility that tales of the Navajo and other peoples about convergent evolution of humans from separate species is true!

giant one. *Megatherium* has not been recovered from the tunnel and has only been assigned as the culprit due to its size and habitation of the area. My money is on *Protopithecus*, whose remains were found in the same area, of Lagoa Santa, Minas Gerias, Brazil. But, on the wilder end, it is not impossible, considering McCarthy's work on hybridization, that the Ground Sloth passed some of its DNA on to *Homo sapiens americanus*, perhaps even by way of *Protopithecus*. Sloths have, in common with humans, after all, genes that regulate metabolism, DNA repair, cell maintenance, immunity, and aging, which has been suggested to have been produced as a product of convergent evolution on a molecular level, and result in shared longevity with comparison to body mass. This is also plausible.

There may be some bridges between primates, sloths, and marsupials, such that something like a mammalian "ring clade" may exist allowing different species to somehow interbreed or exchange genes in another way. Various tree kangaroos, for instance, appear to have superficial similarities with sloths. Some images, such as that of the Goodfellow's tree kangaroo from *Encyclopedia of Animals: Mammals* by Edwin Gould and George McKay, show a phenotypic resemblance to common depictions of *Megatherium*, the Giant Ground Sloth, or otherwise to a bear. Meanwhile, the rat-kangaroo shows a strong resemblance to possums or rodents,[321] and the numbat is equipped with a tongue not entirely unlike South American anteaters, relatives of the sloths.[322] Lisa Dabek is quoted as saying, in reference to "Matschie's Tree Kangaroo" of Papua New Guinea, that "[i]t's a hybrid of a kangaroo, a koala, a sloth, a monkey, and a bear," though the quote is isolated from the rest of the text and given without further context, apparently as told by Woodland Park Zoo.[323] She's likely referring to polyphyletic phenotypic traits rather than genetic relation. Nonetheless, it would make quite some sense if there was a relative or more from Antarctica-Lemuria that tied these creatures together somehow, and which may have been involved in our own evolutionary story. Like Dabek, John Keogh, in "Captivating Tree Kangaroos: Nature's hidden gems," has said that the tree kangaroo's "body is similar to a sloth's, with sharp claws on both their hands and feet." Considering more evidence, this time surrounding sloth-like lemurs and monkeys, *Paleopithecus*,[324] or the Sloth Lemur, is a genus of now-extinct, sloth-like lemurs that used to inhabit Madagascar, tying sloths to primates. Its features, despite being mostly lemurian, are so sloth-like that the name is obviously appropriate, with sloth-like features in the crania and limbs. *Archaeoindris fontonatyii* was another Sloth Lemur, in this case a Giant Sloth Lemur, that rivaled the size of gorillas and *Gigantopithecus*.[325] Madagascar, home to the lemurs, would at one time have bordered Antarctica and perhaps India, Sundaland, or even Sahul, with the Americas possibly not too terribly distant.[326] Brandon Specktor, in "Ancient Monkey Transformed into a 'Sloth' When It Arrived in Jamaica," relays that a fossil primate, *Xenothrix mcgregori*, the Jamaican Monkey, oddly has been found to have similarities to sloths and may have existed as recently as nine hundred years ago by mainstream estimation.[327] It is marked by a sloth-like, slow climbing lifestyle and large molars. Others have suggested that it may be related to the monkey *Aotus lemurinus*, one of the nocturnal "night monkeys," or marmosets. Harry Pettit, in "Extinct sloth-like monkey species 'unlike any primate on Earth' travelled to Jamaica from South America aboard rafts of floating vegetation 11 million years ago,"

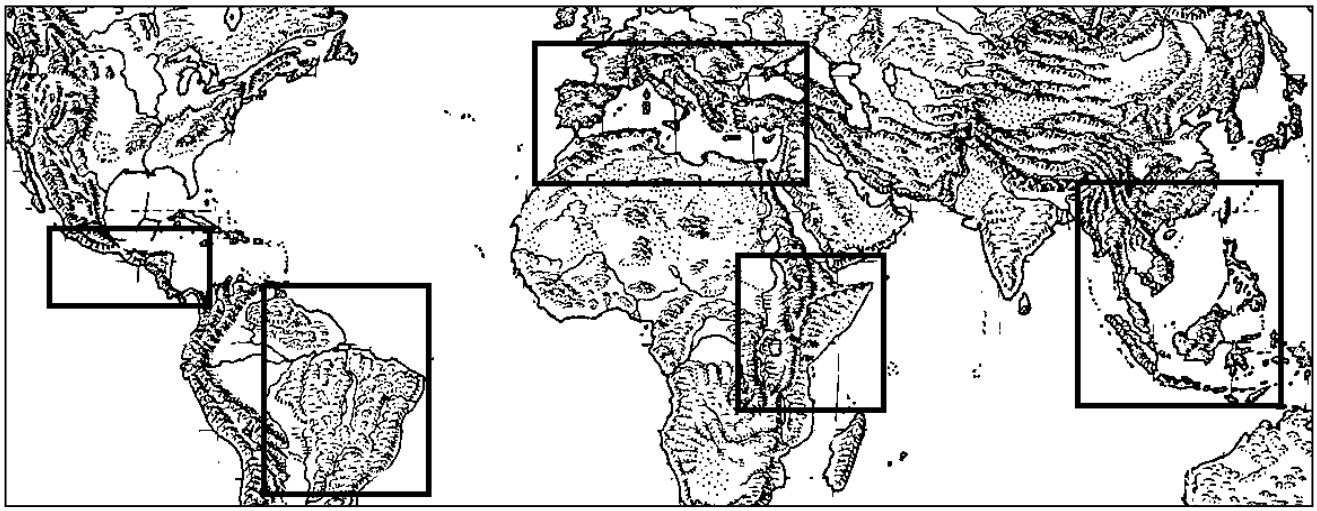
[324] Or *Palaeopithecus*, meaning "before ape"
[325] Other oddities among extinct lemurs include the Koala Lemur, which had probuscian-like facial features commonly considered to be similar to those of a rhinocerous
[326] the rodent-like *Monito del Monte* being the only Australdelphian Marsupial in South America, all others existing in Australasia. Other Australdelphians, such as *Woodburnadon*, have had fossil remains discovered in Antarctica and Patagonia.
[327] See Spektor

suggests that *X. mcgregori* "looked more like a sloth than a monkey," had rodent-like legs, and, despite their small stature, became quite stout.[328]

There certainly are "super-archaic" "ghost species" considered to have existed. Konstantin Popadin *et al.*, in "Mitochondrial Pseudogenes Suggest Repeated Inter-Species Hybridization among Direct Human Ancestors," for instance, write that *pseudogenes*—unusable genetic fragments—suggest that hybridization involving a now-extinct Hominid occurred around the time of the "split" between the *Homo*, *Pan*, and *Gorilla*, and that such hybridization may have indeed been very common. The now-extinct Hominid is seen as responsible for the spread of the gene. Popadin *et al.* said that there are many more pseudogenes in the human genepool as well. [329] While there are numerous possibilities for the now-extinct Hominid, perhaps belonging to a clade from Europe or Asia, such as a relative of the Baboon, Gibbon, or Orangutan, another possibility is that such a pseudogene, even if not this one, could be derived from a genus belonging to the Americas or Antarctica.

Christian Roos *et al.*, in "Nuclear Versus Mitochondrial DNA: Evidence for Hybridization in Colobine Monkeys," have written about the strong degree of hybridization in primates, in this case between *Piliocolobus* or *Procolobus* into *Colobus* by way of female introgression and *Semnopithecus* into *Trachypithecus* by way of male introgression. It seems that various degrees of introgression between various monkey "species" is not at all a strange thing to occur.[330] Similar things have been written about the Australopithecines, such as by Johan Nygren, that the split between *Australopithecus*-proper and *Paranthropus* may have involved introgression from *Gorilla* into *Australopithecus*, resulting in *Paranthropus*. Reiko Matsuda Goodwin has reportedly discovered a cross between a Baboon (*Papio*) and Mangabey (a Cercopithecine), dubbed a *Mangaboon*. One of these specimens apparently lives at the Mt. Kenya Wildlife Conservancy, and is named *Safari*. This is an example of interspecial hybridization between Old World Monkey species. Meanwhile, Michael Bradley holds that some of our unique human features, such as our thumbless and flat feet, "nostrility," and the high sexual dimorphism and aggressiveness among Caucasians (I would add, also, Congoids) may be derivative of backcrossing with these kinds of Old World Monkeys, which he refers to as *Cynopithecoids*. He points especially strongly toward Gelada (*Theropithecus*) or Common Baboon (*Papio*), or the Rhesus Macacque (*Macaca*), pointing to the "Rh" or "Rhesus factor" in our blood. He imagines one of these "Cynopithecoids" mating with an Australopithecine, thereby producing a human, and reminds us of the eager willingness of apes in captivity to attempt to mate with human females, suggesting that Old World Monkeys and Great Apes would have no issue with the desire, and suggesting the main issue might be with forward-facing genitals as they may have been found in Australopithecines but not "Cynopithecoids." Chrissy Sexton, in "Hybridization among wild baboons comes with hidden costs," relays that 20-30% of apes, monkeys, and other primates crossbreed and share their genetic material with other species. *Kooloo kamba* is a purported chimp/gorilla hybrid in Africa. Oliver the Chimpanzee may have been an example.

[328] See Pettit
[329] See Popadin *et al.*
[330] See Roos *et al.*



It is important to point out a key area, which I believe to have been the home of the emerging Australopithecines—here including *Graecopithecus*, *Protopithecus*, *Khoratopithecus*, and etc.— from whom we likely evolved. Importantly, while this area began as a range in physical contact, over periods of Earth's expansion, the area became multiple ranges occupied by specimens now separated as they had never fully been before. This would divide our ancestors one from another, New World Monkey from Old World Monkey.[331] If not Antarctica alone, this was the true *Lemuria*, home of the primates, sought after by Philip Sclater, its originator, and his supporter Ernst Haeckel. To put this clearly, Lemuria, which was conceived to be a sunken continent, was actually composed of a combination of Antarctica, Sunda, the Great Rift Valley of East Africa, the Mediterranean, and the Americas, especially surrounding the coiled up Central America and Brazil, which had all basically been bordering one another on a smaller Earth. Other places that may be considered potential areas of *Homogenesis* might include Antarctica, California, Texas, Mexico, and South Asia. The largest gap between the earliest inhabitants of the Americas and Afro-Eurasia would not have been a body of water at the time, but, instead, Central Africa. Remember, Eastern and Western Africa would have been as close, at this period of time, as the width of Sunda and Central America, which is closer than the span across the African Continent from East to West. *Australopithecus* and *Homo habilis*, and their associated crude stone tool industries, the Lomekwi and Oldowan choppers and scrapers, are concentrated on the Eastern side of Africa, not seeming to have wanted to venture too far Westward, though there have been Oldowan objects found across and outside of Africa as far as China. The other Australopithecines, the unofficial ones,[332] are placed variously in France, Spain, Greece, Egypt, Italy, Turkey, India, China, Thailand, and even, in the case of *Protopithecus*, the New World.

There are other kinds of *-pithecines* (tailless monkeys[333]) that are still around, at least in name (some have tails), such as the *De Brazza Monkey*, an Old World Monkey (Baboon basically) of South Africa, otherwise named *Cercopithecus neglectus* (despite its tail) because of its notoriously cryptic nature, rarely ever being seen by humans due to its tendency to stay still and hide its colorful parts, including a colorful crown. Other Cercopithecines, or *guenons*, such as the *cephus*, *nictitans*, and *pogonias* varities, are either polytypic in their phenotypes or provide an example of *polyspecific associations*, associations between members of separate species. They are known to hybridize at times, but maintain three

[331] It is of interest to note that New World Monkeys engage much more frequently in pair-bonding behavior than do Old World Monkeys

[332] Such as *Pliopithecus*, *Piereolapithecus* and *Hispanopithecus*, *Graecopithecus*, *Aegyptopithecus*, *Oreopithecus*, *Ouranopithecus*, *Sivapithecus*, *Sinanthropus*, *Khoratopithecus*, and etc.

[333] Not all of them are tailless, but this is what the name generally implies

distinctive phenotypes nonetheless. This distinction is maintained through sympatry, with each species having a separate feeding niche but playing the watchman role for each other. Wolf's Mona Monkey, another Cercopithecine,[334] has been known to maintain associations with species as distinct as the Bonobo Chimpanzee and Allen's Swamp Monkey (a strong swimmer and diver, *Allenopithecus*), which is eaten by the Bonobo. *Cercopithecus mitini*, a relative in West Africa, is considered to have a low level of *agonism*, or internal group competition. This is merely scratching the surface of primate mutualism, co-evolution, and hybridization. Of course, many other existing -pithecines, such a *Miopithecus* and *Theropithecus*, are also found in Africa that are not on the list because it is well-accepted that humans evolved in Africa, while it is less accepted that they evolved independently outside of there, thus incentivizing my focus elsewhere. *Bunopithecus* and *Yuonopithecus* were a now-extinct Lesser Apes or Old World Monkeys from China, usually considered to be related to gibbons.

Could it be that *Protopithecus* was of some relation to these other -pithecines among the Lesser Apes and Old World Monkeys in Africa and Asia, including the Australopithecines (including *Graecopithecus* and the like) generally classified as Great Apes, such that, altogether, these simioforms demonstrate the intraorder to be chronodynamic? That is, that simians are a sort of *chronoclade*, analog to a "chronospecies," or *ring clade* analogous to a "ring species," that evolve more or less together as regards the larger timescale, exchanging DNA along the way?[335] Could they possibly even be related to sloths? According to Michael Cremo's quotation of Aime Rutot, in "The Discoveries of the Belgian Geologist Aime Louis Rutot at Boncelles, Belgium: An Unresolved Archaeological Controversy from the Early Twentieth Century," Florentino Ameghino had suggested that

> All of the apes, including the anthropoid apes, came into existence during the Miocene and their brutish descendents come from a stock with only the most primitive intelligence. Therefore, it is not among the apes that one should search for the precursor of humans, because the precursor is more ancient than the ape.[336]

Non-human Hominoids today, besides the orangutan, are concentrated toward West Africa rather than being in East Africa where *Homo sapiens idaltu* evolved. Orangutans are alone in Southeast Asia as Great Apes, though *Gigantopithecus*, perhaps a relative of the gorillas though much larger, once roamed China, *Indopithecus* existed in South Asia, and *Meganthropus* (sometimes compared with African Hominids such as *Paranthropus robustus*), larger than gorillas but smaller than *Gigantopithecus*, in Indonesia, perhaps an example of "island gigantism." *Homo floresiensis* and *luzonensis* are found in maritime Southeast Asia, too, distant from *Homo habilis*, who does not appear to have made it Out of Africa.

Buckminster Fuller points to the "Leakey family's proofs,"[337] alluding to their having discovered *Homo habilis*, the acclaimed first human, in Africa, placing the origins of humans, in mainstream thought but not in Bucky's, in Africa. It's worth mentioning that the Leakey family is a well-to-do, technocratic family, whom, working together, has had a major influence on the world of paleontology. This does not make their findings fake, but it does lead one to wonder if there are political motives for shifting the

---

[334] All Cercopithecines-proper are found in sub-Saharan Africa, though Ceropithecids (Old World Monkeys) more generally are found outside of there

[335] *Monkey* is of relation to the words *moon* and *mons*, and so has reference to a mother of sorts. Before *monkey*, *ape* was solely in use. An ancient word, pre-Indo-European, it *may* be of some relation to paternity, as *ap-* in Welsch is a patronym (*ap-* is from proto-Indo-European *hopi*), perhaps also found in the name *Apollo*, and perhaps means "fathered by." Similar prefixes, such as *aut-*, such as in *author*, are cognate to *father* or *pater*. In Navajo, the word for "ape" or, more generally, "primate" is *magi*. *Homo* comes from Indo-European meaning "of the Earth."

[336] Cremo

[337] Fuller, 11

origins of humanity exclusively to Africa in a post-World War world, after the track record of scientific deception had been established. Indeed, the rise of the Leakey family corresponds with the rise of elitism and priestcraft in postmodern science. Nonetheless, some scholars have questioned if *Homo floresiensis* and others are descended— not from *Homo erectus*, but even earlier— from *Homo habilis* or even a common ancestor. Debbie Argue and Colin P.Groves, have suggested, in "The affinities of Homo floresiensis based on phylogenetic analyses of cranial, dental, and postcranial characters," that *Homo floresiensis*, discovered by a team, is in fact a sister to, or subspecies of, *Homo habilis*.[338, 339] While Southeast Asia and Northwest Africa would nearly touch around Panama on a smaller planet, the Horn of Africa would be even closer, likely touching Indonesia, home to *floresiensis*, placing *Homo habilis*, found in East Africa, right next door. This means that it is not impossible to speak of an "Out of Indo-Africa" approach, one that might even include in it Central America, so perhaps an "Out of Indo-Africamerica" is even acceptable on a smaller Earth. In such a case, the divergence of the human chronospecies would not be due to sympatry or migration, but to the division of the continents of Asia, the Americas, and Africa one from the other. This original divide may have been between *Homo habilis* and *Homo floresiensis* and perhaps also *luzonensis*. Hybridization, then, following the reintroduction of humans, one to the other, and after long periods of isolated selection leading to new features, would be something of a reunion of the species, a return to primordial wholeness.

Before the shift to the Out of Africa view, the most prominent view was that of Out of Asia. Findings such as Java Man, a well-preserved *Homo erectus* in maritime Southeast Asia, by Eugene Dubois; as well as those of Peking Man, another *Homo erectus*, by a team, had established Asia as the most likely candidate. People such as Ernst Haeckel and Pierre Teilhard de Chardin had believed that Asia was the home of the human species. William Diller Matthew had held, instead, that the home in Asia was not in the maritime region, but in Tibet.[340] Peking Man, today considered a subspecies of *Homo erectus* is also known as *Sinanthropus pekinensis*, connecting its origins alternatively to *Sinanthropus* rather than from an African-sourced *Homo erectus*. Java Man, similarly, had received the name *Pithecanthropus* before being assigned to *Homo erectus*. However, *Anthropopithecus* had also been assigned to Java Man, even earlier, a term that had apparently included the Common Chimpanzee. Buckminster Fuller held to the "Out of Asia" view of human evolution. According to Buckminster Fuller,

> The most logically propitious place for humans to survive and prosper within our planetary biosphere was on the coral atolls of the South Pacific and North Indian oceans. Here the [...] temperature of the almost-still water inside the lagoons was so compatible with life that head-above-water humans could stay in them continuously without any unfavorable effect. The lagoons abounded in fish [...] Crystal fresh waters poured down the mountainsides, and coconuts full of fresh milk fell to the ground around the humans. Fruits were plentiful, and there were no wild animals threatening to eat the helpless baby humans.[341]

Fuller alludes, then, to the *aquatic ape hypothesis*—that humans had evolved aquatic features from their time evolving near water— proposed by Elaine Morgan, pointing to our salt water tears, which distinguish us from other primates. Elaine Morgan, herself, and her supporters, pointed to various other features in support of the idea, such as that humans have body fat comparable to blubber which is absent on other apes, that newborn babies can be born underwater and can swim, that humans lack

---

[338] Debbie and Groves

[339] Fuller, himself a globalist and even a Malthusian— even if a more palatable one—, might purposefully be keeping the full story from us, despite his willingness to take a position contrary to the mainstream

[340] Still today, Mario Pichardo holds to an "Out of Asia" hypothesis that *Homo sapiens* had come from somewhere around Central Asia, moved into Europe and Africa to the West, and Asia, Australia, and the Americas to the East

[341] Fuller, 5

body hair except on the head (which she suggested allowed babies to hold on to their mothers while swimming), and a number of other interesting features.

Reck's Skull, or *Oldoway Man*, from Tanzania, considered real by George Grant MacCurdy and Louis Leakey, is dated to the Paleolithic.[342] Reck and Leakey would later suggest it was a younger sample intruded into the older strata, despite the skeleton having been imbedded in rock from an earlier time. The Leakeys would go on to find their own fossils, such as those of *Homo habilis*, and would organize funding for the study of African Great Apes by people such as Jane Goodall, which helped to solidify the idea that humans are related to chimpanzees, a claim that probably does have its share of truth. Still, researchers today, including people such as Jeffrey H. Swartz and John Grehan, have suggested that orangutans, from Southeast Asia, are more closely related to us than chimpanzees are, a claim that is close to heresy in today's age, as it goes against the mainstream model of human evolution established most firmly, perhaps, by the Leakeys.

Long before both of the other theories, the American School of anthropology had become increasingly interested in what is called *polygenism*, the idea that the various races of the planet were derived from different origins. This was derived largely from heretical Biblical thinking regarding the existence of pre-Adamites from before Noah's Flood, but later by scientific evidence, promoted by many thinkers.[343] Josiah Nott would take this so far as to suggest that the different races were derived from completely different animals, such as whales, buffalo, auroks, giraffes, and kangaroos, before going through phases as elk, goats, elephants, and then bears, wolves, or apes, before becoming human beings. As he saw things, if "the teachings of science be true, there must have been many centers of creation, even for *Caucasian* races, instead of one center for all the types of humanity." While his view was overruled by the advance of Darwinism, it foreshadows a conception of convergent evolution that would later become an important part of evolutionary thinking.

The Ameghino brothers, Florentino and Carlos, challenged the Out of Asia and Africa theories with their prior findings from America. Florentino Ameghino claimed that Hominid fossils of *Tetraprothomo arentinus* and *Diprothomo platensis*[344] showed the indigenous evolution of humans in Argentina's Patagonia region, the "Land of Giants." Florentino Ameghino had claimed that some of his finds in Patagonia had come from the Cretaceous, now mostly considered dubious. Florentino Ameghino argued that all primates had come from human ancestors in Patagonia, and that even the lower-ordered primates had come from humans. Ameghino argued that apes were "men who turned beastly." Whatever may be said about their specific claims, the Ameghinos demonstrated that mammals, primates, and even humans had probably evolved independently in South America. Florentino Ameghino would be criticized after Max Friedemann brought casts back to Europe, securing ground for the Out of Africa idea. Still, *Nebraska Man* is the name of a tooth found in Nebraska by Harold Cook that was originally attributed to a human, *Hesperopithecus haroldcookii*, originally agreed to by William Diller Matthew and described by Henry Fairfield Osborn, but that was later said by Edwin Colbert to have belonged to a peccary, *Prosthennops*, identified by Matthew long before, just a few years after Matthew's and the same year of Osborn's death. Also in Nebraska, as well as Kansas was *Loess*

[342] 1.5 million B.C. Another skull has been dated much earlier, to the Pliocene. Giuseppe Ragazzoni discovered a skull, the *Castenedolo Skull*, that appeared to have been a skull of a *Homo sapiens* from the time of the Pliocene. A Professor Sergi agreed with him. There is, of course, room for error, and certainly not everyone agrees with such dates. Most certainly disagree.

[343] By people such as Islamic scholars (on *jinns* and *hinns*), the Familists, Giordano Bruno, Francois Bernier, Isaac La Peyrere, Georges Cuvier, Jeav-Baptiste Bory, Anders Retzius, Samuel George Morton, Louis Agassiz, Charles Caldwell, Josiah Clark Nott, George Robbins Gliddon, Ephraim Squier, and others

[344] The Buenes Aires Skull, *Diprothomo platensis*, was suggested to have come from the Pleistocene

Man, considered at first, upon analysis of the skull, and before its rejection by Hrdlicka, to belong to Neanderthal or some equivalent. Even today, Austin Whittall, in "*Diprothomo* and Lagoa Santa – *Homo erectus*?" holds in favor of the Amerghinos, saying that, decades later, "Alan Lyle Bryan from the University of Alberta found a highly mineralized calotte (skullcap) that had been found at Lagoa Santa in Minas Gerais, Brazil"[345] which appears to be a *Homo erectus*. German Dziebel argues in favor of an Out-of-America view. Jeffrey Goodman, in his *American Genesis: The American Indian and the Origins of Modern Man,* is of the belief that modern humans originated in North America, in California. David Deming, in "Did Modern Humans Originate in the Americas? A Retrospective on the Holloman Gravel Pit in Oklahoma," defends the Out-of-America view.

The discovery of *Homo erectus* or *Homo heidelbergensis* also in Europe and Africa, such as the Mauer jawbone by an unknown worker and Rhodesian Man by Tom Zwiglar, would further complicate the picture. *Homo erectus*, it seems, with all things considered, had come from out of both Eurafrica (Iberomaurusia) and maritime Southeast Asia (Austronesia), and probably the Americas too, possibly deriving from some mixture of *Australopithecus*- and *Pithecanthropus*-derived Hominids, possibly even with some others, as explored later. It thereby became distribute across the planet. It appears that Eurasian *Homo erectus* had inherited the combined lineage of *Homo habilis* in Africa and *Homo floresiensis* in Southeast Asia, the first two considered in the *Homo* genus, the first to split, perhaps to converge, from the Australopithecines. Alternatively, *erectus* may have been a convergent phenomenon arising from the various extinct Hominids that had already existed outside of Africa, such as *Ouranopithecus*, *Pierolapithecus*, and *Graecopithecus* or a relative of *Sivapithecus*, etc. It's plausible, that Eurasian *Homo erectus*, distinct from African *Homo erectus*, had developed from the combination of these early humans—perhaps including African *Homo erectus*— and Australopithecines-proper with these other extinct Hominids. These might include Hominids that did not evolve from out of the Great Apes of Africa, but perhaps, in the case of orangutans and *Sinanthropus*, for instance, from Lesser Apes or gibbons that had evolved locally in Asia, or, in the case of *Protopithecus* and perhaps others, from New World Monkeys local to the Americas. A possible *Homo erectus* that has been styled *Homo affinis* or *Homo affinis erectus* (like *Homo sinanthropus erectus*), going by the name *Pink*,[346] may be the oldest human fossil found in Europe. The Balkan Hominin is another possible *Homo erectus*.

Indeed, the *multiregional* or *polycentric theory* of human evolution— that humans evolved from out of multiple starting places— would develop as a sort of synthesis of the various views regarding the center of human evolution. This view began, perhaps, most seriously with the American School of anthropology and was followed up later with Franz Weidenreich, one of the scientists to discredit Piltdown Man as a hoax. Franz Weidenreich wrote, in *Apes, Giants, and Man*, that humans arose from a mixture of species, including giant ones. In this work, he says, speaking of the interrelation between *Gigantopithecus* and *Meganthropus*, that "the giant from the Hong King chemist shop and the giant from central Java are in the same evolutionary line; the more primitive the forms are, the more gigantic are their dimensions," and that they "appear as a morphological continuation of the large *Pithecanthropus*,"[347] now known as *Homo erectus* of an Asian variety. He says that "all of these forms have to be ranged in the human line and [...] the human line leads to giants, the farther back it is traced," such that "the giants may be ancestral to man."[348] He had noticed many common phenotypic features between Peking Man and modern Mongoloids, leading him to believe that humans are a

[345] Whittall
[346] Discovered in the same areas (Atapuerca mountains) that *Homo antecessor* and others were found, perhaps indicating the area as a hotbed of evolution similar to the Levant or Caucasus
[347] Weidenreich, 60
[348] Weidenreich, 61

chronospecies with local variants that have evolved largely in place since at least the time of *Homo erectus*. Later species of humans, such as Denisovan and *Homo tsaichangensis*, or the Penghu or Hexian remains, an East and Southeast Asian *Homo erectus*, may be Gigantopithecines according to Weidenreich's line of thought, though *tsaichangensis* could also be an indigenous or immigrated *Homo erectus* that evolved Gigantopithecine characteristics from having come to share the same environmental pressures. Weidenreich's polycentric view would later be taken up by Carelton S. Coon, who tended to minimize the geneflow that Weidenreich had considered to be allowable, but who would nonetheless become the most important physical anthropologist to date, even despite efforts against him by intergovernmental organizations. Others, such as Milfred H. Wolpoff, derived their multiregional model largely from Weidenreich, as well. Xinzhi Wu has a model called *Continuity with Hybridization* that is popular in China. These views stress that genetic flow between populations has kept them as a single species. Coon would not necessarily disagree, except in emphasis. But whoever's emphasis is correct, it remains a fact that successful minorities can leave behind disproportional influences, and that even while many foreign genetics—ecologically-speaking— that have been contributed by an immigration may be completely deselected from a population, even a small number of them can contribute toward the advance of the assimilating population.

Whatever the case may be, some variant of *erectus* would become the dominant human form across Africa, Europe, and Asia, including its islands, where it would adapt to the various zoogeographic zones (as they are presented by Alfred Russell Wallace) and establish the Acheulen stone tool industry, making choppers, scrapers, and hand-axes primarily.[349] From *Homo erectus* we would all evolve. Carleton S. Coon, in *The Origin of Races*, put the evolutionary journey of early humans this way:

> It now seems likely that the Australopithecines evolved in Africa,whence they spread to the East through the tropics of the Old World. It is also possible, although it cannot be proved, that the primary evolutionary step from Australopithecus to Homo was taken, not on African soil, but in the Meganthropus-Pithecanthropus sequence. Java, and by extension all of Southeast Asia, is a serious rival.
>
> Wherever Homo arose, and Africa is at present the likeliest continent, he soon dispersed, in a very primitive form, throughout the warm regions of the Old World. Three of the five human subspecies crossed the sapiens line elsewhere. If Africa was the cradle of mankind, it was only an indifferent kindergarten. Europe and Asia were our principal schools.[350]

He says,

> at the beginning of our record, over half a million years ago, man was a single species, Homo erectus, perhaps already divided into five geographic races or subspecies. Homo erectus then evolved into Homo sapiens not once but five times,

[349] In the Old World, these zones include the Orient, which contains Western, Southern, and Southeast Asia; the Ethiopian region, which is basically all of sub-Saharan Africa; and the Palearctic, which was all of Asia except for the Orient, all of Europe, and Northern Africa. Other regions, of the New World, include the Australian region, the Nearctic North America, and Neotropical South America. According to Wallace, animals in these zones differed significantly from one another, such that they must be treated as separate zones of evolution. *Homo erectus* was not contained by these Old World zones, and moved between them, but would nonetheless feel pressures of the zones, which, while falling short of full speciation, would give way to subspeciation or racial types. As said before, Coon maintains that racial differentiation well preceded the independent development of *Homo erectoids* into *Homo sapiens*.

[350] Coon[1], 656

> as each subspecies, living in its own territory, passed a critical threshold from a more brutal to a more sapient state.[351]

By Coon's view, racial differences existed before reaching the state of *Homo sapiens*, with each modern race getting there by a separate route. Each of the present racial groups evolved independently as separate centers of convergence and hybridization. Buckminster Fuller, speaking of archaic humans—seemingly Erectoids of some sort, having developed from out of Java Man or some relative—, says, focusing on Southeast Asia rather than Africa, that

> You can see [...] the great concentration of humanity in Java, Malaysia, and the Indonesian islands, as well as along the original "water-front" areas of the Asian mainland. Together, Burma, Thailand, Cambodia, Laos, and Vietnam are the beachheads of Austronesian islanders "landing" upon the Asian continent. Clearly that is where humanity first went inland and upland into the Himalayas, exploring the Mekong River to its source.[352]

Fuller is speaking, I believe, of pre-*Homo sapiens* "Austronesians," and not the sort that exists today as grouped by language. He means *Homo erectus* when he is speaking of "humanity." Fuller seems to believe that such a *Homo erectus* had built a civilization millenia before that of the Cyclopians, or early Aegeans, who traced their origins in part to giants, arrived in the Mediterranean, and that some of them, after their having "'landed'" on Southeast Asian mainland, had made it up into Tibet, or the Himalayas, where he says that "the ice caps remained," and that from there "water melted to produce great rivers that flowed seaward from the five-mile-high frozen reservoir."[353] Among the rivers coming from out of the Himalayas are the Indus River, the Ganges, the Brahmamutra, Salween, Yangte, Yellow, and Mekong. Fuller points out that the sources of these rivers are very close to one another. The water-savvy people of Southeast Asia, whose culture originated with *Homo floresiensis*, *luzonensis*, and their Java Man *Homo erectus* offspring, would trace the rivers of Southeast Asia to their source in the Himalayas, suggests Fuller,[354] pointing out that

> the only differences between those Southeast Asian peoples are the rivers by which they go inland and upland—to the same source of life-supporting water. It is easy to understand why the Dalai Lama was located in Tibet, at the source of all of their water. That source epitomized God as the physical life-giver and -taker.[355]

The mixture of Asian and European Erectoids produced higher orders of Erectoids. In the Caucasus, *Homo erectus* would take the form of *Homo georgicus*, typified by the Dmansi *Hominins*, often touted as among the first to have made it Out of Africa. Their presence in the area may represent also a retreat by a derivative of *Homo habilis* or earlier waves of *Homo erecti* who managed to make it into Eurasia, only to be followed by an onslaught of later-stage *Homo erectoids* and then Neanderthal and *Homo sapiens*.[356]

Similar to the Dmansi, the remains of a *Homo erectoid*, DAN5/P1, is understood to be a transitional specimen between *habilis* and *erectus* in Africa at a time when *erectus* already existed as a species in Eurasia. This may suggest either convergence or hybridization between *erectus* and *habilis*. *Homo naledi*, for another instance, was recently discovered in the North of South Africa. *Naledi* is a problem

---

[351] Coon[1], 657
[352] Fuller, 20
[353] Fuller, 11
[354] See Fuller, 20
[355] Fuller, 21
[356] This is, of course, a non-exhaustive list, and one that is likely incomplete anyway. It may, nonetheless, serve as a reference to begin looking into the matter more deeply.

for the mainstream models because it is fairly clear evidence of convergent evolution, appearing to be a *Homo* species that evolved independently of other populations. While the Dmansi *Hominins* make a strong case for hybridization between different races or "species" of *Homo erecti*, *Homo naledi* makes for a strong case of multiple origin, or polygenism. But this was true even before *naledi*, as *Paranthropus* remains—those of an herbivorous Hominid— had already been discovered alongside Oldowan tools and a butchered Hippopotamus, suggesting that *Paranthropus* had been at the site. *Paranthropus* may have been there in the same capacity as the Hippopotamus, though it may be possible that *Paranthropus* was sharing a meal or a culture with *Homo habilis*, the typical user of Oldowan tools, or its ancestor. In such a case, this may have been a point of convergence between Paranthropus and *Homo habilis* or kin. The "Cradle of Humanity" in South Africa is home to many possible areas of convergence between *Paranthropus*, *Australopithecus*, *Kenyanthropus*, and *Homo*, including the Nyanga, Sterkfontein, Turkana, and Drimolen sites, among others. William Kimbel, who has long studied human evolution in Africa, has— according to Cathleen O'Grady in "Humans Aren't So Special After All"— argued for the separate appearance of human traits within the continent of Africa.[357] So, even if the Out-of-Africa theory is correct, polygenesis is likely still to be the case, even if just on one continent. This seems unlikely. It seems more likely that polygenesis has occurred on every inhabited continent of the Earth, perhaps including Antarctica.

During certain periods, perhaps especially the cold, otherwise hybridizing species—together a chronospecies— evolved independently from one another, adapting to specific ecological niches and developing unique genetic and memetic virtues as a result. Certain Asian populations, European populations, and sub-Saharan Africans, as a whole, developed independently during these times, stacking up unique traits, before recombining in times of balanced weather. Later *Homo erectus*, for this reason, takes various forms. These populations are understood to have taken to Europe when they evolved (if they did not evolve indigenously), possibly coming from out of Eurafrica and maritime Southeast Asia.[358, 359] In Europe, *Homo erectus* would develop into the higher forms of *Homo caprenensis*, *Homo heidelbergensis*, *Homo antecessor*, and related Hominids. It appears that *heidelbergensis*, treated as early Neanderthal, was a late form of Erectoid that developed first in Europe and radiated outward from there and converged throughout Eurasia, with those remaining developing natively into Neanderthal and Cro-Magnoid. In Africa, *Homo erectoids* would develop into *Homo rhodensiensis*. In Asia, there was an as-yet ungrouped variety of *Homo erectus* associated with Nanjing man and Peking man. Recent taxonomies have also distinguished a variety now known as *Homo juluensis*, meaning "Big-Headed."

Researchers such as Christopher Hardaker, in his "The First American: The Suppressed Story of the People Who Discovered the New World," have argued for the presence of *Homo erectus* in the Americas, pointing to a number of instances wherein *erectus* could have been responsible for artifacts left over. Hardaker says that, in Mexico, at the Valsequillo Reservoir at Hueyatlaco, "Juan Armenta Camacho stunned the world with his discovery of a mineralized elephant pelvis with engravings of elephants, big cats, and other extinct animals,"[360] pointing out further that the pelvis had been engraved while still fresh, suggesting that the carvings had been made at a time when the animals depicted, and the pelvis harvested, were contemporary to the artist. These animals had been extinct for over a million years Hardaker suggests. Juan Camacho had apparently found some support from archaeologists to go

[357] See O'Grady
[358] But even with lateral movement of genes such as this, localized hybridization and convergence took place along the way, and they could have evolved indigenously just as well
[359] Bucky Fuller thinks that the Asian Erectoids had ridden on horses into Europe
[360] Hardaker

about more findings, discovering more artifacts and butchered animals, including a horse jaw and stone knife, as well as spearheads that appear to anticipate the North American Clovis points (and by extension the Solutrean points in Europe) associated with American paleo-Indians, themselves *Homo sapiens*. Unfortunately, the "feature block was later vandalized and destroyed by the Mexican archaeologist who signed the official dig permits,"[361] who went on to suggest that the artifacts had been fakes. Geologists consistently dated the findings to the Middle Stone Age, reports Hardaker, which is much older than the migrations that are understood to have taken place by *Homo sapiens* into North America from Siberia. I have seen it stated, though behind a paywall, that "two 'primitive looking' skulls" were found in Valsequillo, Mexico, that have subsequently disappeared, but are likely to have returned dates similar to Hueyatlaco.

Hardaker's paper seems to suggest that *Homo sapiens* evolved natively in the Americas from an American *Homo erectus* whose fossils appear elusive to us now, and instead of *Homo sapiens* having gone from Siberia to the Americas, may have gone from the Americas to Siberia. This is not the only evidence that has been uncovered to argue in favor of early presence of the genus *Homo* in the Americas. Mastodons in California, at the Cerutti Mastodon site, for instance, have been uncovered which some researchers have concluded demonstrate intentional breakage by humans. These date back to around the Middle Stone Age. At the site were also found cobblestones with impact markings and other wear, suggested to have been hammerstones and anvils. Many other animal remains were also recovered from the site. Still more sites may have also demonstrated an early presence of *Homo*, such as Pedra Furada, Pendejo Cave, the Bluefish Caves, Coxcatlan Cave, and the Calico site,[362] for instance.

Homo ergaster in the Southeast of Africa, was perhaps an early practitioner of monogamy (though this may have occurred earlier), which was likely more like serial monogamy than long-term pair-bonding. Ergaster also showed some reduction in sexual dimorphism, may have lacked the body hair associated with other Hominins, and was early to practice hunting and gathering. Hunting likely grew from opportunistic attacks and the copying of carnivores with whom competitive scavenging or robbing may have taken place after their kill. This early hunting likely involved endurance running wherein prey is chased until it runs out of energy.

Homo bodoensis is a group of late African *Homo erecti* which is subsuming what was previously called *Homo heidelbergensis*, and other late *Homo erectoids* like *rhodensiensis*, from Africa, into it.

Homo antecessor is quite an interesting find, discovered in back-filled subterranean caverns, in trenches and sinkholes, and pits[363] at Atapuerca in Iberia, inhabiting along the Ebro River.[364] Among the

---

[361] Hardaker

[362] Which has since been defended by Leland W. Patterson. Louis Leakey had prior believed that the Calico site demonstrated the presence of humans there for over 100,000 years. For this, his wife, Mary, said in her autobiography that she lost respect for Louis.

[363] In the earlier edition of this book, and within the earlier discussion of the Cercopithecines, I included *Cercopithecus subterraneus*. At the time, I was not aware that this was exceptionally good satire (hosted by a legitimate botanical, and so scientific, site, in my shallow defense). Somehow, I also seem to have associated the names of two renown scientists, Thomas T. Struhsaker and William T. Stanley, jr., with the satirical *subterraneus*, in my personal notes (curiously, separate from those pertaining to the original article), no doubt contributing to my acceptance of the animal as real. An internet search connecting Struhsaker and Stanley to *Cercopithecus subterraneus* now comes up completely empty, however. Before the recent changes to the internet, it was possible to treat names and concepts together as searchable, as more data could be retrieved from an online query, so I was not anticipating the decline of the internet. I originally mentioned Struhsaker in the context of the original paraphrase, suggesting that these names may have since been removed from the document (or else another such document I read independently and interjected that from, which is not my typical behavior). This peculiar series

findings were evidence of nutrition-driven cannibalism as well as bear and elephant bones. There have also been fossils and tools associated with *antecessor*, who has been said to be flat-faced, to have modern nasal bones, an occipital bun, and a strongly-developed sphenoid or "butterfly bone," but with shovel-shaped incisors as are found in Capoids of South Africa and Mongoloids of Asia, and a surprisingly small jaw for a carnivore of its caliber (eating large animals and humans), as well as long limbs. *Antecessor* shows a greater degree of sexual dimorphism than do other humans of the time. It may have been early in adopting the lifestyle of a hunter-gatherer, hunting and gathering and bringing food back to the band instead of eating on-site like a forager. Eudald Carbonell, however, has suggested that *Homo antecessor* was a predatory cannibal who hunted other humans for sustenance. *Antecessor* has been associated by some to the Dmansi Hominids and has been suggested to be ancestral to Denisovan, and perhaps also to Neanderthal[365] and *Homo sapiens*. *Antecessor* was almost called *Homo mauritanicus* because an occupant of Iberomaurusia. *Homo antecessor* means "pioneer man" because it is suggested to have been one of the early pioneers of Europe. Also found at the site were ritualistic items such as a red quartzite Acheulean tool, from *Homo heidelbergensis* perhaps. It appears that *Homo heidelbergensis* may have been avoiding *Homo antecessor* by appeasing it with sacrifices utilizing the red quartzite. All of the *antecessor* bones that showed signs of cannibalism were those of children, and may just as well have belonged to *Homo heidelbergensis*.

Homo heidelbergensis, like *antecessor*, is understood to have contributed to Neanderthal and Denisovan, as well as *Homo sapiens* genetics, such that it is often suggested that all were basically

---

of events leaves me with much distress, as I appear to have acted in error, but without having certain closure on the matter.

Regardless, and while I admit my egregious error, I now present *subterraneus* in the footnotes as a useful thought experiment rather than as a documented species, because, even if complete satire, it is quite convincingly plausible (or else I'd have never accepted it to begin with). It also appears to continue in the theme of *fin de siècle* preoccupations with subterranean fiction, as well as with Bigfoot legends, which I believe to be of some significance anthropologically-speaking. I am not suggesting that this is factual, but that it provides a useful thought experiment with regard to how a subterranean ape may come into being, something that may become pertinent to the evolution of *Homo antecessor* and that will be tangentially considered in discussions of mythology, cryptozoology, human evolution, more recent cave dwellers, and subterranean monsters of fiction.

Our gagsters, "Oondoue M. Boue" and "Reginald Pennyworth Maudlin-Jones," in "Burrowing Behavior of Wild Bluetail Monkeys at the Makokou Study Area, Gabon," say *Cercopithecus subterraneus*, or the "Bluetail Guenon," is the only subterranean species of primate, the only monkey or ape that burrows underground. They say it sometimes inhabits sympatrically alongside *Cerocopithecus neglectus*, typically preferring to live in areas found undesirable by other primates, such as beneath putrid-smelling and virulently-entangling vines, digging with their feet before their hole is deep enough to hide them, whereupon they commence with their hands, sometimes connecting their tunnels and chambers with those of neighbors. The pranksters elaborate that they will suck in their stomachs to an impressive extent and feign illness to appear scraggly and unappealing to predators. Their eyes, they say, have difficulty adjusting to light due to their having adapted to subterranean living, perhaps similar in some respects to a mole or vole, and they are low-energy owing to a lifestyle of near-torpor, and communicate by scent rather than by vocal utterances, similar to some prosimians such as lemurs. The Bluetail Guenon's burrowing behavior is suggested to result from pathologic self-isolation caused by phobias correlating with population decline rather than from advantageous use of resources, as their habitats appear to provide a substantial range of resources without resorting to subterranean living.[363] The authors suggest that the species was the most populous within the genus, and probably superterranean or terrestial before the drastic decline in population coming out of the Pleistocene (which itself ended around the time of the Younger Dryas). See Boue and Maudlin-Jones

[364] The Ebro River, according to the Ebro Frontier Hypothesis, was a significant geographic barrier that allowed later Neanderthals to persist in the area an exceptionally long time, perhaps suggesting some continuity between *Homo antecessor* and Neanderthal

[365] Mitochondrial DNA closer to Denisovan than to Neanderthal, nuclear DNA shows closer relation to Neanderthal, for what it is worth

deviations from *heidelbergensis*. It would subsist on a much larger game. *Heidelbergensis* would haft stone heads onto spears, suggesting the possible use of missile weapons, and made wide use of red ochre. During interglacials, *Homo heidelbergensis*, in some parts of the world, may have enjoyed periods of relative sedentarism, as may be suggested from evidence of stone foundations. Like most other in the *Homo* genus following after ergaster—including *Homo sapiens*—, *heidelbergensis* continues the human tradition of tamed sexual dimorphism, though there may be some signs of retrogression toward disparity in size as well.

Homo longi, when considered with the Penghu Jaw, appears to be an Asian "Neanderthal" possibly evolved from out of *Gigantopithecus*, or otherwise an Australoid or Denisovan. *Longi* is among the longest human skulls discovered, and it was discovered very recently, so the details, similarly to Denisovan, are still being kept under wraps from us riff-raff. *Homo longi* appears somewhat like the Steinem Skull of disputed classification. Mario Pichardo, in "Overview of Paleoindian Taxonomy and Migration Hypotheses," likes to retain the use of *Pithecanthropus* for certain specimens otherwise deemed *Homo erectus* or its derivatives. In this he follows Teuku Jacob. The Steinheim skull, typically considered a *Homo heidelbergensis* or early Neanderthaloid, may be of some relation to *Homo antecessor* or *longi*. However, Mario Pichardo prefers to consider it distinct from *"Pithecanthropus heidelbergensis*," his preferred taxonomy for *Homo heidelbergensis*, calling it instead *Homo steinheimensis*. He also considers *Homo habilis* to rather have been *Australopithecus habilis*.[366] This demonstrates the highly interpretive nature of fossil findings.

Fascinatingly enough, modern humans are not the only ones interested in fossils. As Marie-Helene Moncel, *et al.* have suggested, in "Non-Utilitarian Lithic Objects from the European Paleolithic," *Homo erecti* such as Peking Man have been found with fossils, as have Neanderthals, who were avid collectors of fossils and also crystals.[367]

It was in Southern Europe, that *Homo neanderthalensis*—or Neanderthal— would evolve. *Neanderthal*, perhaps our closest relative aside from *Homo heidelbergensis*, and sometimes considered a subspecies of *Homo sapiens*, was a large, robust humanoid that lived throughout the habitable parts of Eurasia. Some classify Neanderthal as *Homo sapiens neanderthalensis*, a subspecies of Homosapien, due to the many similarities shared between Neanderthal and modern humans, including playing music, boating, making clothing, manufacturing birch bark glue, using different methods of cooking, making use of medicinal plants, and etc. Neanderthal has been associated especially strongly with the use of *yew* wood, from the yew tree, and the first Neanderthal tools, from the Basque country, were made from yew. The interactions between Neanderthals and *Homo sapiens* has been a topic of much interest. The politically-correct narrative is that Neanderthals were more-or-less similar to modern humans, perhaps having different areas of ecological specialization, but otherwise having much in common.They had brains of similar size to modern humans, and there was a fair amount of interbreeding between the two, as well as with other humans of the time. *Homo sapiens* were spear-throwers whereas Neanderthals probably held them more, but Neanderthal was intelligent and industrious, being responsible for the Mousterian tool industry, and fond of the use of yew wood for tools, but tended to eschew symbolic thinking as would become common among *Homo sapiens* and as was likely common, as well, among the Denisovans.[368] Neanderthal burials in the Zagros Mountains at Shanidar Cave, however, had

[366] See Pichardo
[367] Moncel, *et al.*
[368] In a certain respect, this tendency away from symbolic thought provides a foundation for European sentiment, which over the millennia has been faced with onslaughts of religion and statism coming especially from the East. Neanderthal represents, in a certain respect, Native European common sense, whereas Denisovan might stand for Eastern religiosity and supernaturalism.

flowers, perhaps for medicinal or ritualistic purposes, perhaps suggesting the individual's position as a *shaman*, a religious leader, or medicine man. Like *Homo heidelbergensis* and other later *Homo sapiens*, Neanderthal made use of red ochre. Neanderthals probably had an extremely high in-group preference and were very ritualistic and traditionalistic. Various explanations have been given for their drastic disappearance upon the arrival of *Homo sapiens*, ranging from ideas about extermination by force or disease, outcompetition after environmental changes, or even assimilation and crossbreeding. Eric Trinkaus, for instance, has argued that humans came from Africa but that Eurasian humans have a strong amount of Neanderthal input. Michael Bradley says, in "The Rise (and Fall?) of Esau's Empire," that humans

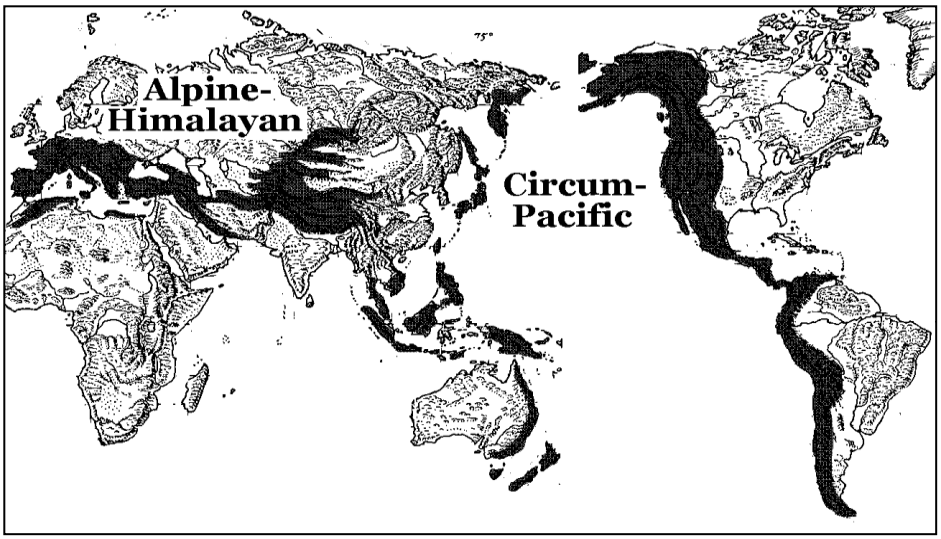
> returned as incoming migrants when Europe's weather warmed up temporarily [...] And, as these new migrants entered Europe from the Atlantic coast and from North Africa across the Mediterranean [...] the outnumbered Neanderthals in the lowlands were assimilated. Any remnant purer Neanderthals retreated up into the higher mountains where their preferred glacial climate was still preserved in the higher elevations.
>
> Relatively pure Neanderthals sought refuge in the Pyrenees, Italy's mountainous spine, France's Massif Central, the Alps and the Balkan mountains. But they were gradually assimilated by the mixed Europeans living all around them.[369]

Whatever the case may be, there is also a growing politically-*in*correct narrative about the Neanderthals. The Shanidar Cave also has the first known example of intraspecific violence between Neanderthals, showing a point embedded into a victim who died after receiving care from the group, the point still implanted. And some Neanderthals have been discovered with occipital buns, which have been attributed to allowing for sight with less light. *Them and Us: How Neanderthal Predation Made Modern Humans*, by Danny Vendramini, describes Neanderthals as powerful, hairy, and largely nocturnal predators of modern humans, who were nonetheless very intelligent, powerfully robust, and brutal. He suggests that recreations of Neanderthal by artists are incorrect and are motivated by sentiment, while comparisons of the profile of Neanderthal skulls to the faces of gorillas and chimps shows a great degree of similarity, much more so than when compared to the faces of anatomically modern humans. Vendramini holds that Neanderthals had much more musculature when compared to modern humans, and that their robust skeletal frames were required to handle this fact, a fact that allowed them to become apex predators who hunted not only mammoths, rhinos, and humans, but also large cats such as the saber toothed cats. Others have suggested that Neanderthals were particularly high in testosterone. Danny's work suggests that Neanderthal predation of humans, especially in the Middle East, did much to impact the evolutionary trajectory of anatomically modern humans, including in terms of athleticism and dexterity, creativity, cognition and reasoning, and capacity for cooperation. Still, the first known cooked food is what was probably what amounted to a Stone Age veggie burger, also found in Shanidar Cave, made of pulses, grains, and seeds. So it is not impossible that some of the Neanderthals there were eating vegetarian, alongside practices of cannibalism.

Homo Denisova— or Denisovan—was a large Neanderthalid that had the genes needed to climb high altitudes and to survive cold temperatures with brown fat, now inherited by Tibetans, Yaghans, and Eskimos. They had super-robust fingers and teeth larger than *Homo sapiens* or Neanderthal. Denisovans were themselves relatives or a version of Neanderthal, but their remains have been associated with jade, marble, and ivory jewelry that likely had some sort of symbolic value and required great skill to make. They tended to inhabit Asia, including maritime Southeast Asia, rather than Europe,

[369] Bradley[1]

where their influence is more scarce and outnumbered. Denisovans may have evolved from *Gigantopithecus* or *Meganthropus*, which inhabited in and between areas such as Indonesia and East Asia, and from which they may have derived their robustness, though there are alternative hypotheses. While generally associated with Asian populations, evidence of Denisovans have also been found in Europe, where Neanderthal was more prevalent, particularly in Spain. The name, *Denisovan*, comes from the fact that its remains had been found in the Denisova Cave of the Altai Mountains in Siberia. While this cave is generally understood to have been formed by sedimentary rocks, and not volcanoes, it does occur just South of the Siberian Traps, especially in Nowosibirsk, composed primarily of volcanic rock, and maps show volcanoes and strong fault line activity in close proximity to Denisova Cave. The Alpine-Himalayan and Circum-Pacific volcano belts host most of the world's volcanoes, and Denisova Cave appears to be around the tip of that. The "jade" ring of the Denisovan is actually *chloritolite*, which is a chlorite rock, a magnetic rock[370] that occurs by way of hydrothermal metamorphism in veins, and is sometimes called a *serpentine* rock, a type of green magnetic rock that is found alongside or has among it chloritolite, as well as with gold and copper, in the Southern Ural Mountains. The production of the ring is a mystery, as the ring material appears to require a rate of drill rotation that would have been inaccessible to *Homo sapiens* of the time. Alistair Coombs, in "Denisovan Star Trails: Archaic Memory of the Pleiades in the World's First Story," suggests that the *Denisovan* moniker would have meant "bear people" had the indigenous name of the cave been used. He connects the *Pleiades myths*, those surrounding the Pleiades star cluster, to the Denisovans.[371] He connects the Pleaides to the Seven Sisters in American Indian, Australian, and other myths. *Ursa Major*, the "Great Bear," is often compared to the Pleiades.



In Italy is found the *Devil's Trail*, or *Ciampate del Diavolo*, footprints made in volcanic ash, considered to be made by some sort of pre-*sapiens* human during a time when the ash was fresh, perhaps *Homo heidelbergensis* or a Neanderthaloid, either Neanderthal-proper or Denisovan. Apidima Cave was found in Greece, being home to both Neanderthal and a population of *Homo heidelbergensis* or relatives sometimes claimed to be *Homo sapiens*, perhaps an example of an emergence of our subspecies. Neanderthal was the hybrid of prior extinct human groups, as was Denisova (which some haved called *Asian Neanderthal*), *Homo heidelbergensis, Homo longi*, *Homo erectus,* and everyone

[370] It contains magnetite
[371] See Coombs

else. The continuation of this pattern would produce *Homo sapiens* in the form of the Omoid (*Homo sapiens idaltu*), and then *Homo sapiens sapiens*-proper, perhaps beginning with Levantoid, Australoid, and especially Cro-Magnoid and Mechtoid, before developing the present races of today, themselves collections of different genetic groups that have been selected for success by their environments, rather than being themselves a single inbreeding family of common origin.

There is currently suggested to be genetic evidence for at least one "ghost species" that early humans had interbred with, suggesting that there is a "species" that is as-yet uncatalogued or underconsidered. Perhaps this is some kind of Neanderthaloid, or perhaps *Homo floresiensis* or *luzonensis* or some undiscovered being. But for now it remains a mystery, at least to you and I. But there are ideas. Alan Rogers believes there to be a "super-archaic" human that may be intermixed with Neanderthal, Denisovan, and Yoruba people, among others, relays Ruth Schuster in "Ghostly Genes from Super-Archaic Hominin Found in Late Human Species." He believes the Tibetan quality of being able to withstand high elevation does not come directly, though possibly indirectly, through Denisovan, and likely by way of a prior admixture event, and suggests that the creature may be of some relation to *Homo antecessor*.[372]

Many sites show the presence of early humans, often associated with shelters made of wood or stone and accompanied by the presence of fire or tools. Terra Amata, in France, may have been home to a settlement, likely of *Homo heidelbergensis* or early *neanderthalensis*. Beeches Pit similarly shows the presence of *Homo erectus* or *heidelbergensis* in England. Humans, in their various forms, have been around long enough to witness evolution in action. The cave systems of Mount Carmel in Israel had been inhabited since long back into the Old Stone Age, the time of *Homo erectus*. The Acheulo-Yabrudian cultural complex had witnessed various stages of stone tool industry development from out of the Acheulean industry developed perhaps from the Oldowan inherited from *Homo habilis*, going from scrapers to handaxes and then on to proper blades. Places such as these could easily have been centers of secret wisdom regarding evolution and world heritage, having endured through glacials and interglacials. Some of our myths—perhaps those involving the Yeti and other Bigfoot-like "crypto-Hominids"— likely reflect legends about some of these other humans.

Giants and Cryptids of Myth or Legend

Myths and *legends* are those fantastical stories from long ago that excel more simple folklore in their supernatural and extrahuman claims, such as by suggesting that non-human or otherwise strange entities, oftentimes with unique capacities, have a particular influence on the world. The Egyptians had myths involving gods with animal heads, whereas the Goths had tales of shapeshifting monsters. The early Greek poets, such as Homer and Hesiod, told histories in the forms of myths, such as that of Perseus, with Appollonius of Rhodes giving us tales such as Jason and the Argonauts, though Plato later warned not to tell history with poetic flare, because it tends to become believed by the ignorant. The Renaissance humanists and early Enlightenment thinkers, such as Georg Pictorius, Giambatista Vico, and the German idealist philosophers such as Schelling and Schiller, would find interest in the relics left over from the Egyptian, Greek, and German myths and legends, with the Age of Discovery adding fuel to the fire by exposing Europeans to the myths of other peoples, allowing them to engage in comparative mythology. Settlers in the United States, for instance, regularly came across tales of Native Americans. They would also establish their own European American folklores, sometimes coinciding with native tales, such as those surrounding *Bigfoot*, an alleged Hominid that has so-far eluded science that is named after the discovery of footprints by Jerry Crew, a bulldozer operator who saw them in the

[372] See Schuster

mud. Edward Tylor explained myths, similar to the Greeks in their following of Sanchuniathon or Pictorius in his description of the Greek myths, largely as analogies of Nature. Myths would continue to be studied by Germanic thinkers such a the Grimm brothers and Carl Jung.

While the general trend in mythology has been to explain forces of Nature, there have nonetheless been mythologies that, instead of explaining, merely attempt to document the happenings of Nature. This being the case, there are some areas of religion that appear to be of historical value, such as the story of Jericho in the Abrahamic religions, and some of the geneaologies that have been kept track of. It may be that the first to establish this more historical sort of effort were either Ancient Siberians or Native Americans who explored natural history through geology and kept track of lineages through totems and burial sites. Not entirely unlike scientists speaking of five mass extinction events, the stories of the "Fifth World" are told by many Native Americans about how the Earth had undergone a series of creations. There are many tales of giants within these stories and all throughout the world. While these stories are not generally treated in the mainstream approaches to evolution, from a cross-disciplinary perspective interested in what is coming from Out of America, it seems impossible to ignore, because these stories are abundant in the anthropological literature. Where do they come from? Is there any possibility that they are true?

Giants are understood, in the mythologies of the Native Americans and many other peoples, to have had existed before a world cataclysm that had destroyed them or otherwise severely decreased their numbers. The *Si-Te-Cah*, for instance, were said by the Paiute Indians[373] to have been cannibalistic giants with red hair, driven out by their Paiute ancestors, the last of them burned alive in Lovelock Cave. The giants' remains were reportedly, though controversially, discovered in Lovelock Cave by guano collectors. Indeed, signs of scorching and skeletons were found. Some of them are said to have been very large, and had red hair. Others were reportedly missing marrow, suggesting cannibalism. A giant sandal is said to have been found, fit for a giant, and a giant handprint discovered. In a lakebed nearby, other giants were said to have been discovered, also red-haired. Princess Winnemucca had red hair from the Si-te-Cah in the fabric of her dress. The Choctaw also have tales of giants called *Nahulo*. Like the Si-Te-Cah they had red hair. Some of the stories place the giants in the Sierra Nevada Mountains. The Aztecs, Paiute relatives, told tales of giants called *Quinametzin* who were destroyed by the gods for their not worshipping them. The Bitterroot Salish Indians, a Flathead people, traced their origins to a time when the people-eaters were killed. Many of their tales, involving Coyote and Fox, involve legends of geological formations, some of which, says The Division of Indian Education, in "Montana Indians: Their History and Location," may suggest a presence well before anyone migrated from Siberia, before the Ice Age.[374] Many tales are told by Native Americans of the giants inhabiting underground cities, sometimes in volcanoes, mountains, or canyons. Some of the Native Americans had themselves lived in volcanoes, such as the Maya in the volcanic Lake Atitlan, and worshipped gods such as *Cizin*, meaning "the stinking one," often described as stinking of singed hair. Also known by other names, Cizin is a death god, associated with the underworld, volcanoes, and natural disasters. Native Americans are not alone. Giants also find themselves in European lore. In Anglo-Saxon literature, particularly *Beowulf*, for instance, Eoten and Beowulf are creatures that are sometimes called *Jatti* or *Yotun* and that are sometimes similar to Bigfoot and translated as *giants*. Grendel is an important example of one of them, a son of Cain, and a cannibal, God's adversary, who lives in a marsh den and is a *shadow-walker*, a type of boogey-man.

[373] Who speak an Uto-Aztecan language
[374] 40,000 years ago, see Division of Indian Education

You might recognize also a connection to the Christian tradition. *The Bible*, the preferred religious text in the West, discusses the death of the giants, or the Nephilim, by way of Noah's Flood, which according to Christian myth or legend had covered the entirety of the Earth. Serious geologists such as John Joly have certainly described a mechanism by which this was possible, though his beliefs regarding the timeframe largely discount Noah's worldwide flood. Walter Brown contends that the Great Flood did occur, and that it happened at the time of Noah and was very intense. In a way, and not entirely unlike some of the Native American tales, the stories in *The Bible* relay an account of human evolution, about how catastrophic forces of Nature, rendered as "*Acts of God*," wiped the slate clean, leaving to remain only those of higher quality, who are more "fit" for survival.

Giants have been associated with *megalithic* or giant stone constructions, such as those found at Sage Wall on Sage Mountain in Montana, an apparent aquifer of these Titans, perhaps a means of controlling water to the valleys below; or the rock wall at Rockwall, Texas, which appears to have been a corral for mammoths or protection from massive predators, perhaps.[375] These structures are not accepted by mainstream science, but those who have seen them themselves and who utilize common sense readily accept them as man-made structures. They appear to me as such from the videos I have seen of them from laypeople. If there is any merit at all to efforts by people such as Alexander Koltypin, settlements can be found in many locations under the ground, often suggesting habitation and construction by giants, efforts of which are called *Cyclopian*. Koltypin suggests that these structures exist all across the Mediterranean, and believes that they may have at some point been connected, having since been separated, he suggests, by erosion. While I am inclined to disagree with his dating— he suggests dates into the hundreds of thousands of millions of years at times—, Koltypin does reference some actually-existing evidence to make his argument, and his reasoning for thinking structures were built by giants before Noah's Flood (or earlier) appears to be somewhat cogent. He is not alone in these sorts of claims, as many religious or catastrophist archaeologists do the same. Young Earth Creationists and Old Earth occultists alike often believe giants to have cohabited with dinosaurs, pointing to such things as human footprints that have apparently been found alongside dinosaur prints in locations such as Dinosaur Valley at Glenrose, Texas. This seems unlikely, but I leave these claims on the backburner in the name of good science. Unlikely does not mean impossible, just improbable.[376] One creationist, Mark Armitage, is a microscopist by trade and, after his apparent discovery of soft tissue within a *Triceratops*, a three-horned dinosaur, and having supplied a peer-reviewed paper on the matter, was later censored due to his creationist beliefs. That's not how science properly operates. Since his discovery others have also disclosed having found soft tissue in dinosaur fossils.

The story as presented in *The Bible* says that, somehow, though they had been killed off, there were giants again in the land of Canaan, Goliath being one of them. Some Christians are of the belief that some of the giants survived the Flood in a tunnel city underground, as by planning in ways so as not to let the water enter into them.[377] It does beg the question, however, of where their oxygen might have had come from.

Kent Hovind, a "creation scientist," pointed out in "The Hebrew of Israel"'s "What Was the Pre-Flood World Like?" that the death of the dinosaurs, megafauna, and large prehistoric insects, which he

---

[375] Could it be that the mammoths of Eurasia were escapees from this corral who fled Northward?

[376] The same can be said of Dale A. Russel's concept of the *Dinosauroid*, a thought experiment about the dinosaur *Stenonychosaurus* continuing its evolution (having been relatively large-brained, semi-upright, with "hands") to a final result of becoming anthropoidal, which, if it were true, could possibly explain humanoid footprints millions of years back. This would depend greatly upon the human form being an objectively better one for advanced life.

[377] This may not be entirely unlike submerging an upside-down cup into the water, and maintaining air in it even while underneath

understands to have mostly existed before the Flood, may have been due to a lack of oxygen.[378] This may be a fair point. The Earth had more oxygen at the time of the dinosaurs. Many scientists attribute such a thing to a loss of plankton in the oceans due to a catastrophic event, such as an asteroid at the end of the Cretaceous and beginning of the Paleogene. An event much earlier, the Ordovician extinction event, has been blamed on an algal bloom due to *eutophication*, or response to sudden increase of nutrients. Hovind further points out the effects of concentrated oxygen on human blood, such as on hemoglobin and in plasma, which he says becomes "oxygen saturated, which means you could run hundreds of miles without getting tired." He suggests that under such conditions one heals much faster, as well, pointing to the benefits of *hyperbaric oxygen*, or pure oxygen breathed under high pressure, which he believes can be used to treat ailments such as multiple sclerosis and arthritis, among other issues including cerebral palsy and autism. He points further to the use of chambers to supply hyperbaric oxygen by professional athletes and by farmers to grow massive specimens of produce. He connects higher levels of oxygen to magnetism.[379] It seems apparent, then, that, if there were giants, their lives were largely dependent upon a pre-cataclysmic condition that included less gravity and more oxygen on a smaller planet. This is the Creationist view, but I don't think it can be discounted on those grounds alone. A fair point is a fair point, no matter who it comes from.

The giants, if they exist at all, were survivors from before the Ice Age and from a smaller Earth more rich in oxygen, and so would already have had a reason to get into the oxygen-making business for the sake of their own survival, possibly even before the Flood, to endure gigantism in an ecosystem no longer suited for it, an adaptation to a new niche. Is there any way this could have been possible?

If there is anything to the Electric Universe Theory, the cataclysms of the past might have included strong electrical storms, storms which advocates claim had even carved the Grand Canyon with electricity. Could it be that these storms were observed by the giants inhabiting volcanoes, and that they derived therefrom an understanding of electricity that is largely unbeknownst to us today? Hovind tells us that electromagnetism had a lot to do with the rich oxygen of the pre-Flood conditions of the Earth, and it is well-known that by way of electrolysis one may derive oxygen from water. Volcanoes are very active with lightning, even producing their own from out of their ash, called *volcanic lightning*. There was, perhaps, no better place to observe electricity than from a volcano. While not as ancient, we do know of possible proof that the ancients had some awareness of electricity, even if it was limited. The ancient Baghdad batteries, for instance, using grape juice or vinegar and copper rods in clay jars, are hypothesized to have been used for purposes of electroplating items with gold, which we know the Americas were especially rich in. Praveen Mohan has demonstrated that ancient lingams (holy relics) from Indonesia were used to generate small amounts of electricity through electrolysis using water, gold, silver, and iron, used for ritual healing. Could giants have somehow survived the Flood in obsidian lavatubes or concrete tunnels of their own creation, supplying themselves with oxygen underwater like a submarine does today through electrolysis, but utilizing free energy from nature?[380] It seems that, at this point, one can only speculate. But it is strangely within the realm of speculation, and the mythologies of the world are emphatic that there were giants, that they lived in volcanoes and mountains, and that they had strange abilities.

Who could the giants be? If they did exist, could they still be around? Are we familiar with them already?

---

[378] See The Hebrew of Israel[2]

[379] See The Hebrew of Israel[2]

[380] What might this say about ancient pyramids, which some have suspected to have been sources of energy? Might these have been flood survival structures?

Outside of official academia there is a field called *cryptozoology* that looks at the possibility of animals from myths or legends that have eluded scientists. Mac Tonnies, for instance, put forward the concept of a *cryptoterrestrial*, a creature from Earth that disguises its own activity as if it were extraterrestrial in nature. Tonnies thought that the phenomena that are usually associated with UFOs, space aliens, and other paranormal events described by folk testimonies could in fact be owed to Earth-based beings. He contends that these beings have likely lived in parallel to human beings since the dawn of human origins. While populated primarily with laymen like Tonnies, however, Carleton Coon, an academic, was actually a proponent of the idea that *Sasquatch*,[381] or "Bigfoot," perhaps an American ape, was a legend and not a myth. In his "Why There Has to Be a Sasquatch," he not only relays a couple of tales of the creature, but cites evidence of its hair and blood having been analyzed and declared to have been a primate of unknown origin, declaring this "substantially impeccable evidence"[382] of the existence of the sometimes blonde-haired,[383] *cryptid*, or elusive, ape, which Jane Goodall, the famous primatologist, also affirmed the possible existence of. Similarly, Jeff Meldrum was an anthropologist who believed Bigfoot to be real on the grounds that he was a specialist in hominid foot anatomy and locomotion and had studied and catalogued a large number of Bigfoot tracks that he believed, due to the nature of the form they took and the unlikelihood of so many people faking the same anatomy with such precision, that many of them had to have been genuine artifacts. Coon suggests that such a being is more intelligent than we are in the sense that it can live in every climate without the use of modern technology. Sasquatch is known to carry a heavy stench, however.

Curiously, *Matah-Kagmi* is the Modoc word for Bigfoot by Mount Shasta, while *Meh-Teh Gangme* is the Tibetan word for Bigfoot. Is this pure coincidence? In the Himalayas, Sasquatch is known instead as the *Yeti*. Others have called it the *Abominable Snowman*. The remains of a hand, called the *Pangboche Hand*, is claimed to be that of a Yeti who had become a Buddhist disciple to Sangwa Droje. Some who have analyzed it claim the hand belonged to a Neanderthal, but the only Neanderthal that would have made it into the Himalayas would likely have been Denisovan. There is also stories told of a Yeti finger, belonging to William Charles Osman Hill. Terje Dahl, among others, believes there to be a potential Sasquatch connection to the Denisovans. Sasquatch in Caucasian folklore is called *Almas*,[384] perhaps related to the *Arimaspi* or "Cyclopians" and to the paying of alms. There are also many white American folktales surrounding discoveries of giants that have been covered up and hidden from the world, as is explored by Eddie in "Did Giants Once Live in Underground Cities Across America?"[385] Sharon Day, in "The Slope-Headed Ones: America's Original Tribe?," speculates about a race of people who live in caves and tunnels, are highly carnivorous, sensitive to light, and only come out at night. She evokes North Carolina's "Moon-Eyed People" for an example.[386] Andrew Collins, in "Debunking the Ancient Aliens Hypothesis: Meet the Ancient Humans & Giants Whose Descendents Were the Annunaki/Watchers/Nephilim/Egyptian-Gods ('Civilization Bringers') of Ancient History," writes that an ancient "civilization" had existed long before those of modern humans, possibly belonging to Denisovans, who interbred with Neanderthals and humans, thereby creating giants. Some of these giants were among the Neanderthal-*sapiens* hybrid Swiderians, he suggests.[387] Collins suggests that the

[381] An Anglicization of a Native American term meaning "Hairy Man"
[382] Coon[2]
[383] The hair sample analyzed was black
[384] Interestingly, *alma* is also a very primitive proto-Indo-European hydronym for "water," such that *Almas* of the mountains may be named after their proximity to the source of the *alma* there

[386] See Day[1]
[387] Whom I would categorize as a Hyperborean or Lappoid people. The Swiderians are sometimes compared to Solutreans due to their tool industry. Collins associates this population also with Sungir (itself related to the Kostenki population), Afontova Gora, and Gobekli Tepe.

giants found in burial mounds in America are Denisovan hybrids, and that "in Java the Denisovans are perhaps remembered as the Raksasas, a giant race said to have been the earliest inhabitants of the island,"[388] pointing also to Gunung Padang, which he places in the Middle Stone Age.

The main thing standing in the way of acceptance of Sasquatch is the lack of physical examples like carcasses or bones on display in public institutions. Bob Gymlan, however, in "Bigfoot: the Corpse of 1847," says that there is only a small amount of Gorilla fossils in existence, all teeth, owing to their natural habitat. The same may be responsible for the lack of Sasquatch fossils in the Pacific Northwest and elsewhere, Gymlan suggests. The existence of Gorillas, he says, was only proven scientifically around two hundred years ago, though oral tales and physical depictions go back thousands of years. Perhaps, Gymlan suggests, the same will occur with Sasquatch.

There *is* a photo known as the *1894 Hudson Bay bigfoot photograph* that shows what appears and is claimed to be a Sasquatch dead in the snow, reportedly having been shot by trappers of the Hudson Bay Company, which had established trading posts in the area, an area reportedly inhabited by *Coyote*, a "trickster" figure from Native American mythology. Another possible account of evidence includes de Loys's Ape. *De Loys's Ape* was a large tailless monkey or ape discovered by an expedition of de Loys's group into the jungles of Argentina. As the story goes, de Loys and his group were accosted by the animals, who flung dung at them, after which the large male was shot at but a female was killed, the carcass of which was propped up for a famous photo depicting the animal. It appeared similar in form to a spider monkey, though it lacked a tail and seemed much too large to be a spider monkey, being estimated at five feet. It would be formally named *Ameranthropoides* after its photo having been forgotten for years after the hectic trip and then rediscovered. If true, this could represent something similar to *Protopithecus*, although *Protopithecus* was understood to be particularly robust. It may be that this De Loys's Ape represents a newly, convergently emerging species of ape that has not been promoted in the mainstream for fear that it would rattle the Out-of-Africa model promoted by identarian Jewish and black interests.

The most popular case for evidence today is the *Patterson Film,* a film showing a Sasquatch walking in between the woods. Having seen it myself, the *Patterson Film*[389] does *appear* to be genuine footage of a Sasquatch. However, I am skeptical and maintain a healthy dose of agnosticism. For one thing, the Sasquatch in the film does not have bare nipples as would be expected from a mammal, especially a human or near-human primate with full breasts. Mammals, named after their mammaries, typically have exposed nipples so that those mammaries can be of use to newborn offspring. And, aside from humans who use them for sexual-visual stimulation during frontal copulation, these breasts are not typically full or prominent except when nursing. The lack of naked nipples on full breasts in the apparent Sasquatch video is in itself just about enough to damn the film.

If Sasquatch does exist, however, and has anything to do with the stories of giants building subterranean cities, with the pit and mound cultures of North America and Eurasia, it may be safe to assume that Sasquatch ritualistically buries its dead, accounting for the lack of specimens. And, in that case, some suspect that the giants found in the mounds of the Americas,[390] which has also been suspected as the phenotype of Denisovan, may actually in fact be of some relation to Sasquatch, and that this is supported by Native Amerian tales of admixture with Sasquatch, and noted genetics from Denisovan among some of them. Scott Moody says in "Sasquatch DNA: A Red-Haired Sister to Humans?" that "[s]ometime in the past, a female human mated with something else, and all of the

[388] Collins[1]
[389] From 1967
[390] Associated with the Otamid phenotype, discussed later

Sasquatches are descendents apparently,"[391] suggesting that DNA testing of an American Sasquatch showed human mitochondrial DNA from a Eurasian, as well as an unknown, type. The mythologies of the world are clear about something, though. The giants are ancestral to at least some of us *Homo sapiens* too. Real or not, they represent what we have evolved away from, our dark past. This has many psychoanalytical connotations that have made their way into the mythologies of the world, to later be analyzed by people such as Carl Jung.

Not all cryptids are necessarily giant Sasquatches. Some of them, at times grouped together with Bigfoot though otherwise treated separately in the category of "wild men," and sometimes associated with vampirism, are apparently relatively short or average in size, compared to normal humans. The Minessota Ice Man, for instance, was a frozen, fur-covered humanoid body that was claimed to have been found in Siberia or, alternately, Vietnam or even the United States. Its owner, apparently a rich Hollywood Californian, had apparently given over possession of the body to Frank Hansen, who had started to show it at public events. Concerned that he would face trouble from authorities for having a dead body, however, Hansen had apparently had a replacement made. Because of this, the Smithsonian Institute concluded that the original had also been a fabrication, and it was widely deemed a hoax. Still, Boris Porchnev was convinced of the authenticity of the Ice Man, believing it to be a relative to or relict of Neanderthal. He believed that many pagan rituals were performed as offerings to the being in Eurasia, as relayed by traditional tales and folk accounts, and that they are the devils spoken of in Eurasian religions such as Zoroastrianism and Hinduism. Bernard Heuvelmans and Ivan Sanderson developed the name *Homo pongoides* for the species represented by the Ice Man, though Vitali Andreyevich Khakhlov suggested the name *Primihomo asiaticus* for wild men of this sort. Robert Gayre would go on to argue that *Primihomo asiaticus* was basically what others today might call a variety of *Homo erectus*, and, in particular, the sort ancestral to Mongoloids, such as *Sinanthropus*. Gayre says, in "A Rationalization of the Ethnological Divisions of Mankind," that "the accounts we have of crossings between this species, the Mongoloids, and quasi-Caucasoids, not only produce fertile offspring, but quite normal human beings,"[392] excepting for a tendency toward broad noses and high-pointed heads. He believes that Capoids and Andanamese Islanders may also be derived from *Primihomo asiaticus*. Elsewhere, Zana the Wildwoman was a possible female *Homo erectus* captured in the Russian Caucasus, and Michael Bradley reminds us of the *Agogwe*, short humanoid creatures that live in East Africa and look like human Bonobos with red hair. In "Esau's Empire, Part 1," he says that, Cuthbert Burgoyne had seen some of them socializing with baboons, walking among them mutualistically, even eating crabs together. He was informed that the locals knew about this for a very long time, and that they were called *Agogwe*.[393] Wyoming was curiously home to a race of people who have produced at least two significant mummies, the San Pedros Mummy and Chiquita,[394] both being quite miniature. These may have connection to the Atacama skeleton found in Chile or the Alyoshenka skeleton found in Russia, though they appear to be quite different phenotypes. All of these are typically considered to be deformed, mummified fetuses or prematurely-born babies, but skeptics and Native American traditions have held that these were adult beings representing an ultra-pygmy race or races of human. William Charles Osman Hill famously considered the existence of the ledendary or mythological *Nittaewo*, which he considered may have been relict *Homo erecti* (*Pithecanthropus*) in Sri Lanka, otherwise said to have been eliminated by the Veddoids.

[391] Moody
[392] Gayre
[393] Bradley²
[394] Chiquita is notably blonde

Chimeras are an interesting occurrence as well. Unlike hybrids, which represent an admixture within a creature, chimerism occurs when separate phenotypes are expressed in the same organism due to having two genotypes in the same individual. For instance, given a dog or a human may express two separate phenotypes, usually recognizable by having two separate colors of eyes. However, there are more extreme cases. Chimerism, for instance, may include hermaphroditism, where one has elements of both sexes, as was the case with Foekje Dillema, or a division of the body into separate persons, as experienced by Taylor Muhl, who suffers from autimmunity problems (the body attacking itself as an intruder) and has a line down the middle of her body dividing a darker from a lighter half. There have been chimeras of various degrees created intentionally in lab settings as well, though they have been terminated early on, at least in the public eye. McCarthy speculates on his website about the possibility of hybrid chimeras, wherein one half of the body might be of another creature, similar to a half-man and half-horse *satyr* or a half-snake *naga*,[395] or the various gods of Egypt, from ancient myth and lore.

Sexual Dimorphism

Sex is an important driver for all primates', including humans', social structures. Among mammals, staying alive is sometimes secondary to fecundity, especially as one ages, because fecundity is a more surefire way to see one's genes passed along to the future, the goal of life. For this reason, it is not uncommon for animals to defend their young from predators, as any homesteader with broody chickens will tell you, or to act as a decoy, as the *killdear*, a species of bird that plays dead, may do. Human parents, aunts and uncles, or grandparents may also sacrifice for their children, nephews and nieces, or grandchildren. All human social organization ultimately relates in some way to sex, [396] parental care, or survival[397] at its foundation, as with most animals. Buckminster Fuller tells us that

> In a herd of wild horses there's a king stallion. Once in a while a young stallion is born bigger than the others. Immediately upon his attaining full growth, the king stallion gives him battle. Whichever one wins inseminates the herd. Darwin saw this as the way in which nature contrives to keep the strongest strains going. This battling for herd kingship is operative amongst almost all species of animal herds as well as in the "pecking order" of flocking bird types.[398]

Indeed, this agonism also seen among primates. The male human jawbone, in fact, is designed-or-selected to take a punch, and the human fist to deliver that punch— as much as is possible— without fracturing. Fistfights among human males, even today, are quite often, if not most often, over females, whether directly or indirectly (as by way of status displays, defense of honor, etc.). But while males may have had a hand[399] in sculpting one another through co-evolution, men and women have similarly had a hand sculpting one another through sexual selection. It wasn't enough for square jaws and well-lined-up phalanges[400] to present themselves, these had to be met with aesthetic or practical satisfaction by the female. Females whose tastes matched with the new, successful phenotype, might find that their sons carry those genes as well. In this way, the male esteem for wide hips, thin waistlines, and prominent breasts, and the female esteem for square jaws, wide shoulders, and pronounced genitalia tends to drive

---

[395] *Naga* is actually linguistically cognate to English *snake*

[396] Conspicuous consumption, or "consumerism," for instance, is driven by sex, as it is largely about socio-sexual displays of fashion, status, etc. that signal to the other sex, and even one's competitors of one's own sex, one's social, and so sexual (as these are tied), value. Political and economic power increases one's capacity to consume, and give one even the power to direct the sources of one's consumption.

[397] Typically for the sake of sex and parental care. Grandfathers are not as survival-fit as grandmothers, because grandmothers provide greater service into old age through transgenerational parental care.

[398] Fuller, 60

[399] Pun intended

[400] Fingers

the species more and more in this direction, leading, more likely than not, to a future of much more sexually attractive individuals (technological influences notwithstanding).

Humans are Great Apes. The social structure of Great Apes is directly tied to their sexual dynamics, and is directly reflected in their biology, in the form of sexual dimorphism. *Sexual dimorphism*, first identified by Georges Cuvier, refers to the division of the species into two morphologies that are distinguished along sexual lines. In Great Apes, sexual dimorphism includes the difference in size and robustness between males and females, as well as the difference in canine teeth between them. And this correlates with their sexual arrangements. Roger Lewin, in *Human Evolution: an Illustrated Introduction*, tells us that "in monogamous species, in which competition between males is low or absent, males and females are typically the same size," but that "all species in which there is significant sexual dimorphism exhibit some degree of polygyny. Enlarged canines are also found in polygynous species."[401] Sexual dimorphism is *the* major indicator of social organization among Great Apes. Roger Lewin, speaking on Hominoid social organization, says that

> Gibbons are monogamous, with no size difference between males and females. In gorillas, a single male has control over a group of females (and their offspring): this is known as unimale polygyny. Single male orangutans also defend a group of females (and their offspring), but the females do not live as a group but instead are distributed over a large area: this is sometimes known as exploded polygyny. In chimpanzees, several related males cooperate to defend a group of widely distributed females (and their offspring): this is an example of multimale polygyny.[402]

In species in which a single or few males control a harem of females, as in unimale or multimale polgyny— ordinary among orangutan, gorilla, and Common Chimpanzee populations—, male morphologies tend to display robust features, relatively large body size, and pronounced canines for male-to-male combat over control of the harem. In species where the harem is more distributed or does not exist, along monogamous or polyamorous lines—as in the gibbon or the Bonobo—, the species tends to be more gracile, with little size difference between males and females, and little difference in canine tooth size.[403]

As it turns out, sexual dimorphism also relates to homosexuality, and not the way one might expect. According to Benedicte Salvetat Rey, in summing up the work of Vincent Savolainen, in "Scientists Reveal What Drives Homosexual Behavior in Primates," Savolainen "found that male macaques who mount each other form alliances that could give them access to more females—and therefore eventually more offspring," suggesting that homosexuality is a primate adaptation for corporate bargaining power over females. This is consistent with the agonistic nature of male-male mounting behaviors, which is what is regularly seen in nature. Further, this sort of thing was found to be "more common among species in which males and females are dramatically different sizes, such as mountain gorillas," suggesting that homosexual activity increases more frequently under greater degrees of sexual dimorphism, which tends to also suggest greater degrees of testosterone. This flies in the face of the idea that homosexuality correlates more strongly with effeminate, low-testosterone men. These strong disparities between males and females "often occur in animals which live in larger social groups with intense competition and stricter social hierarchies," supporting the idea that homosexuality correlates

---

[401] Lewin, 69

[402] Lewin, 64

[403] Bonobos are known for their lack of male dominance structures, pedomorphism (infantile features), and for high status females, owing to alliances between females, leading to some degrees of matriarchy, and putting sexual selection largely in the realm of female choice. This contrasts to Common Chimpanzees, which practice multimale polygyny and alliance-formation between males.

to hierarchical social organization. Meanwhile, primates that have lower sexual dimorphism "tend to live in pairs or smaller family units." The study, of course, must defend itself politically, and so warns against common sense. As such, Rey says that Savolainen "warned against 'misinterpretation or misuse of our findings,' such as 'a misguided notion that social equality might eliminate' same-sex sexual behavior in modern humans."[404] Why might such a warning be necessary? Because it is a common sense conclusion, able to be arrived at independently by basically anyone reading the paper. Well, we're common sense folks, and we're not heeding that warning.

Human beings display a reduced sexual dimorphism when compared to ancestors such as the Australapithecines. Our sexual dimorphism has, more or less, been steadily decreasing with some fluctuation. Human male and female body size difference is relatively minor (both from reduced male size and increased female size), male canines are reduced, and we are more gracile than our ancestors. This reduction in overall sexual dimorphism indicates shifts toward more egalitarian social structures, approximating those of the gibbons and Bonobos to some degree.

Unlike the polygynous and dimorphic gorillas and Chimps, anatomically-modern humans have tended to be (imperfectly or serially) monogamous and to lack sexual and political hierarchies throughout most of their existence (as hunter-gatherers). Some degree of sexual dimorphism does persist, and this may contribute to the sexual division of labor that is common among humans, and may be connected to impulses that have led to reversion to patriarchal rule and harems in more technologically-developed societies. But despite the remnants of sexual dimorphism, it is nonetheless true that archaic and existing hunter-gatherers have tended to be monogamous and to lack coercive hierarchies, instead tending to *acephaly* or, at most, functional and symbolic hierarchies.

The decrease of sexual dimorphism in modern humans can be attributed to many factors.[405] Among those of interest to our study in mutualism, are the development of large brains needed for advanced coalition-building, fraternalizing of beta males, organized sex resistance by females, and the development of projectile weapons.

Robin Dunbar, in works such as "The Social Brain Hypothesis" and *Grooming, Gossip and the Evolution of Language*, suggests that the brains of humans developed the way that they did, in large part, because of the social benefits that larger brains allowed for. These would include social grooming and alliance or coalition-forming. Coalition-forming has been displayed also in both male Common[406] and especially female Bonobo Chimpanzees, but coalitions are limited among chimpanzees due to their limited communication and planning skills.

Coalition-forming in our human ancestors is likely to have involved the fraternalization of *beta males*, males of low rank who were excluded from sexual privileges that would have been restricted to *alpha males*, those of higher rank. Beta males would have formed coalitions in order to "even the score" with their alpha rivals, finding "strength in numbers." The greater the ability to plot and communicate plans, the greater coalitions of beta males would find solutions to eliminating alpha males. The advance of projectile weapons would further limit the power of male prowess. Even stones, when used by coalitions, could level the power of robust alpha males. But missile weapons, like throwing sticks, boomerangs, atalatls, javelins, slings, poison darts, bows and arrows, and more could level the playing

[404] Rey

[405] Sexual dimorphism changes involved both the growth of females and reduction in the size of males

[406] Among Chimpanzees, it has been found to be a common strategy for older males to form coalitions that go about electing an alpha, over which they have influence by controlling the alpha's platform. At any time, the older males could remove the younger stud. But they maintain him so long as he allows the older males to have mating privileges.

field on a more individual basis. No matter the size or robustness of an individual alpha male, missile weapons hurled by a smaller opponent could end their life. Beta male success would decrease sexual dimorphism and increase gracility for future generations. We are the descendents, primarily, of these successful, ex-beta males, their success giving way to human social equality. Buckminster Fuller describes this process when he says that

> I'm sure our human forebears went through quite a period of giants and giant-affairs evolution. These probably led to all sorts of truth-founded legends from which fairy stories were developed, many of which are probably quite close to the facts of unwritten history. Then humans developed to the point at which a small man made a weapon, a stone-slinger, such as in the story of David and Goliath, with which the little man slays the big man by virtue of a muscle-impelled missile [...] so skill and human muscle-impelled weapons ended the era of giants.[407]

The beta males were not alone in their efforts. Sex strikes have long been a powerful means for women to gain influence over men, as women control the supply while men have a high demand. Chris Knight argues that *Homo sapiens* owe their existence to "cosmetic coalitions" of women painted with red ochre pigment, united against rape by dominant males. Knight suggests that they looked to support from their brothers—probably beta males—, to help ward off larger males who would not accept "no" for an answer. Himba tribal women, to this day, wear red ochre pigment, and Igbo women are understood to have formed themselves into a council and wielded strikes, including abstinence from sex and domestic duties. Knight further suggests that sex strikes gave women leverage needed to put idle males to work.[408] Aristophanes, a playwright from Ancient Greece, mentions a sex strike in his work, *Lysistrata*.

Fraternities and sororities likely involved cults of various sorts, traceable, in part, by their love of red ochre, a particularly colorful, red clay pigment. Some of these cults may have been centers of hybridization, uniting early humans across racial or subspecific boundaries.

Coalitions by women and beta males, and the development of projectile weapons, served to weaken the control of alpha males, to reduce the power of brute strength, and to empower pro-social behavior, resulting in a much more gracile breed that displayed a reduction in sexual dimorphism and a propensity for listening. This would also have created an atmosphere in which intelligence would be selected in at a much more rapid velocity, in place of brute force. Because of the need to form coalitions, such intelligence would not be limited to mere cunning, but would also involve a good deal of diplomacy. Multimale and female bonds into coalitions, combined with monogamy, would eliminate the porous nature of a fision-fusion society and replace it with a transition toward band society, wherein members are more or less permanent, and are related as extended family. The pressures of sex-strikes put onto the male members of the troop or band would also increase the productivity and industriousness of those males. It is from the fraternities and sororities associated with resistance to alpha male control that the uniquely human story of mutualism really takes off. The resulting "political" equality would become a defining condition of our species, which would orient our evolutionary psychology for time to tell.[409] Our widespread mental problems in our culture— as might be suggested from a position of evolutionary psychology— results largely from a cultural disruption to this primal

---

[407] Fuller, 63

[408] See Knight[1]

[409] Gangs and states are reversions to alpha-led social structures that conflict with our biological orientation, which had developed in the circumstances of small bands and clans

equality.[410] Various shifts between fraternal, sororal, and patriarchal associations are likely to have occurred throughout the duration and existence of successive human subspecies.

As well as a reduced sexual dimorphism and increased intelligence, many humans display many features that can be attributed to domestication, such as flattened faces, a feature shared with many domesticated animals, including dogs. The more domesticated a dog, the flatter their face tends to be, and, it turns out, the same tends to be true with humans as well. Both dogs and humans have been responsible for their own domestication, to varying degrees. Dogs self-domesticated by evolving in proximity to humans, but humans are mutually self-domesticated, resulting from forces such as sexual, social, and cultural selection. Mutualism between *Homo sapiens* and canines may have contributed to the extinction of Neanderthal.[411] Some, such as C. Loring Brace and others, however, would argue that Neanderthal was not killed off, so much as evolved into modern humans. It seems appropriate to suggest that both occurred, as straggling Neanderthals who didn't keep up evolutionarily with their evolving kin, or who did not hybridize with other humans, would likely not have been favorably sexually, socially, or ecologically selected for in the long run.

By way of coalitions and alliances, utilized in mutual aid for sororal, fraternal, or communal purposes, and in cooperation with dogs—in short, through mutualism—, humans have had a major influence on their own evolutionary direction. Females and beta males freed themselves from alpha male control. And it is not impossible that proto-philosophic specimens from various archaic human subspecies came together into cults, hybridizing, and deselecting outsiders, as will be mentioned later. This makes us something of a *chronospecies*, a species that continues as one major unit as it evolves through time, because it would entail that geneflow occurred between "species" all the way throughout our existence, meaning that the extinct human "species" are not species at all, but races engaged in intraspecific co-evolution and coopetition[412]. This would support the idea that mutualism and hybridization may be at the very heart of what it means to be human.

Human Speciation

Human *speciation*— if we are to continue calling it that despite our really being a chronospecies with subspecies—, and the spread of races and ethnicities, can occur in a number of ways. This may involve *genetic drift*, whereby genes are at first shared between a root population and then separate into areas wherein deselection occurs differently, selecting in Population *B* one set of genes and in Population *C* another, despite *A* having carried both sets, leaving each to inbreed, and so to solidify into a race or ethnicity. Speciation may also involve isolation of new mutations, whereby a widely favorable mutation appears but is not spread to the rest of the species, distinct from genetic drift, sometimes into a "pocket" or one-way niche.

Isolation, and so impedimentation to gene-flow, may occur because of climatic hindrances or geographic barriers such as glaciers, ice-capped mountains, new or dangerous waterways, impenetrable deserts, or etc., thereby contributing toward speciation. Many of these barriers are periodic or episodic, such that they are not always as restrictive as they can be. Shifting continents can also separate populations, as is likely to have occurred with *Homo habilis* and *Homo floresiensis*. These are forms of *allopatric* (or sometimes *peripatric*, when between an offshoot population) speciation, or speciation by geographic separation. Sometimes, in a process of *sympatric* speciation, though, different ways of life, often related to cults and *endogamy*—the marrying within a particular ethnic group or class—, separate

[410] Social hierarchy, which is an artificial, human construction, is a major cause of mental illness
[411] Neanderthal is not truly extinct, because all non-African populations contain Neanderthal genes
[412] Cooperative competition, competitive cooperation

people who are living in geographic proximity to one another.[413] These kinds of practices are often an attempt to maintain a characteristic associated with a founding figure of a given ethnic group, who himself had began the ethnicity as a cult following, likely having polygynous privileges within the following.[414] In this way, *social stratification*, the division of people into *castes* or *classes*, particular segments that are then ranked, is a force of proto-speciation. Populations having speciated enough to become different races may further spread, sometimes interbreeding with other populations, often after having eradicated breeding-aged males in warfare. Later on, after the development of civilization, males might be kept in some number as slaves and then serfs or peasants, and later as workers, civilians, and citizens. The lower class would often be of a different racial or ethnic ancestry than their upper class conquerors, who, early on, tended to be lighter-skinned people in the times of the cold, with darker-skinned people gaining an advantage in the heat, thereby re-balancing things. Over time, the racial lines would bleed.

One of the places that isolation presents itself in a periodic fashion, according to the climate, is in the Mediterranean (Southern Europe, Northern Africa) and Near East, where the difference in rainfall during glacials and interglacials means the difference between ice-capped mountains or those that can be passed more easily, and between desert and savannah. For instance, the Sahara Desert has long been a barrier between the more Southerly portion of Africa because of the difficulty of crossing its sand dunes. Cold dry periods, trapping ice in the mountains and at the poles, served to dry up the Sahara, separating sub-Saharan Africans from the rest of the planet at this time, resulting in genetic drift and isolation of mutations. This isolation of populations in Africa from the rest of the world, during dry periods, applied pressures of speciation, resulting in the unique African phenotypes of the forest-edge loving and jungle-dwelling Congoids and the savannah-bound Capoid. But during wet periods, such as during interglacials when the ice is melted and water is freed into the atmosphere, desert areas can become grasslands and savannah ranges, and this has indeed been the case with the Sahara, which once was occupied with common African wildlife such as hippos and giraffes, and also some of the ancestors of Capoid people (if Rhodesian man stands as such, as Carleton S. Coon suggested). Similarly, during warm periods, mountain ranges may become easier to cross. In times of cold and dry weather, especially, the tendency toward isolated subspeciation will increase by way of desertification and glacial traps, while in warmer and wetter weather, the tendency is more toward recombination and hybridization (except where water has separated continents and caused the formation of islands). The difference in height among Pygmies seems to speak of a time when the climate is warm, while large size tends to suggest colder climates, telling us perhaps of the oscillation in climate between cold and warm periods. In hot and humid periods, climax systems, with emergent trees, are more likely to cover the Earth, placing further pressures to reduce the size of the human body, as among the Pygmy. While the general tendency on islands is toward gigantism, humans have been shown to shrink in size on islands, perhaps similar to *Homo floresiensis*. Some of these pressures likely account for some of the "dwarfism"[415] that can be found outside of Africa. The tendency toward dwarfism on islands by humans may be described by *Foster's Rule* as an aspect of *island syndrome*. It is also important to note that maritime travel is likely to have been practiced by breeds such as *Homo floresiensis* and *luzonensis*, as

[413] The modern, endogamous Druze people, for instance, are an example of sympatry, as they are often found in societies such as Israel, fighting in the Israeli armed forces alongside Jews and other people, but do not intermarry with them. Similarly, the ruling classes of Europe, the nobility and especially the royals, did not *mongrelize*, or intermix what they understood to be superior or foundational genes, with people outside of their ethnic group, and even then only among closely-related classes to their own.

[414] Unlike races, ethnic groups are often composed largely of interweaving familial relations, such that an ethnic group might be considered to be a sort of macrofamily

[415] This term is still often used, despite *dwarfism* medically implying proportions that differ from most humans, which is not necessarily the case with these specimens

their presence in Indonesia and the Philipines indicates, and was also within the capacity of *Homo erectus*, probably ancestoral to these others, as indicated by the presence of Java man. Whether these extinct Hominids contributed toward the genetics of modern Austro-Melanesians, Austronesians, or Austroasiatics is uncertain but not unlikely.

In absence of isolation, favorable mutations may start to pass around through sexual or environmental selection, changing the chronospecies, moving the whole group forward, or a portion of it, as with races; which typically does occur over long periods of time. Outside of climatic conditions, which, along with geographic barriers, caused isolating events, the general tendency has been to hybridize. However, even in rough climatic conditions, or when facing barriers, hybridization occurs in various convergence zones. These zones were points of intersection between societies or were treated as areas of refuge.

Reasons one might take refuge in a convergence zone are many. One might have been a member of a previously dominant group, or even a ruling caste or class, which has had resentment built toward it: perhaps that is the story of Denisovan. One might be albino, or, oppositely, like a Tamil, may find oneself to be "untouchable" for one's dark skin. One might be a miscreant, perhaps a thief, rapist, or murderer. One might be a political or religious rebel, a heretic or radical. Whatever reason might drive one to be cast out from one's own group, pushed out of one's homeland, or inspire one to leave is sufficient. Those taking refuge tend to some degree to bring with them archaic or taboo phenotypes, establishing robust populations that advance when the time is right. Highland people, for instance, and arctic dwellers, might advance down the mountains or Southward when cold temperatures push them to do so. Despite being themselves largely composed of archaic refugee races, their diversity and robustness may at times allow them to advance. Other reasons, of course, may also compel them or advantage them in their conquest. These might include the drying of the desert, the threat of neighboring groups, natural disasters, or a number of reasons.

Isolation events had isolated hybridized populations, which were then selected harshly by a changing climate and thereby sculpted to the land, forming unique races. There appears to be, then, an ebb-and-flow of hybridization and genetic drift, of putting genes together and then resorting them. Much genetic diversity is to be found in sub-Saharan Africa, for instance, representing a higher tendency toward subspeciation or a richer diversity of founding Hominids, perhaps representing a higher rate of mutation; whereas in Eurafrica and Eurasia, especially Europe, where eye and hair color is the most diverse, the tendency has been more toward hybridization. When it comes to humans, it seems that *hybridization*—the mixing of different types— has an *emergent* effect, whereby the "whole is greater than the sum of its parts," similar to a table being more than legs and a top, but the assemblage of these into a more useful unit than each piece is on its own. However, hybridization requires new material, or it becomes inbreeding. So there is a balance to be struck between hybridization and subspeciation. New material comes from unique genetic mutations, which may be the richest in sub-Saharan Africa. South and Southeast Asia also has a high frequency of genetic variation, though comparatively less geneflow from West to East than the flow from East to West in Europe, or so suggests Coon.

Hybrization often occurs in a *parapatric* fashion, wherein populations that do not generally mix exchange genes in an inequal proportion, as by one population sharing genes downhill with another that does not share their own uphill. In specific, hybridization may take place in a fashion of *multiple convergence*, wherein polycentric and parallel evolution occurs before a final combination or grouping follows. This means that a grouping of organisms will have evolved separately before being placed in the same group, their similarities being owed not to a common genetic heritage, necessarily— though likely similarly grouped— but to common environmental circumstances. For instance, a race of *Homo heidelbergensis* may come into contact with a race of Neanderthal and interbreed, creating a new

hybrid subspecies. This may occur in many different areas, along a clinal convergence and in a hybridization zone. If the populations expand from different centers, but meet, and begin interbreeding themselves with little effect from doing so because of their similarities, they may eventually be grouped together as the same race or subspecies, despite their having multiple origins.

As you can see, there is a continual theme of hybridization going on, with peoples and cultures arising after mixing with others. But they also become isolated in pockets of survival, where their gene-flow and communication with others becomes limited, leading to racial, subracial, or ethnic differences as a result. Hybridized populations are better-able to survive changing conditions, and thereby to pass the filters of natural selection, but they also need new genetic material. When a mixed population is hit by climate change or catastrophe its surviving members pass along those gene-sets that helped those members to survive. This, in turn, gives the once open, and so mixed, society a unique flavor of its own. And by giving support to those who may not have the same genes, and so may face more sickness or other problems as a result, the society may further ensure its survival in case the climate changes in favor of those genes again. In this way, human genetic variation, even within ethnic or racial groups, supports the group as a whole. As a result, however, the ethnic or racial makeup of a given culture may change to some degree or another over time.

The mainstream alternative to the hybridizing view of humans, or of multiregionalism, is the Out of Africa view, which often proposes that human evolution took place by way of one, two, three, or more major migrations from out of Africa. There is certainly much evidence that there were waves that flowed from out of the African continent, and they certainly affected the genetic heritage of populations living outside of Africa. The various contradicting models likely need to be overlaid, all of them probably having some truth as to the genetic flow from out of Africa over time. Another alternative to both multiregionalism and Out of Africa is Out of Asia, which had been taken quite seriously by a number of scientists for some time, often considered to have taken place from out of maritime Southeast Asia especially, and which suggests— at least by some accounts— a very ancient basis for the Arctic dwelling peoples or *Hyperboreans*.[416] Like the Out of Africa theory, the basic arguments of the Out of Asia theory can be subsumed into a multiregional outlook on evolution, such that both Africa and Asia, along with other places, can have varying degrees of influence in evolution, with certain locations being especially strong drivers. This is also true of fringe hypotheses such as the *Out of the Americas*, stressing the social nature of New World Monkeys; *Out of Australia*, stressing how ancient Australian aboriginal culture is;[417] as well as ideas surrounding mythical continents such as *Lemuria*, used to explain the divide between New and Old World primates; and *Mu*, used to explain the origins of Pacific Islanders.

Conservative anthropologists, posing another alternative to multiregionalism, might take quite seriously the geneaology recorded in *The Bible*, which, in my opinion, may be somewhat factual as it regards the paternal origins of the ruling class. It is likely true that there have been particular paternal lines that have been interwoven throughout their associated ethnicities, perhaps even differentiating them to some extent. Indeed, racial and especially ethnic groups require a certain degree of inbreeding— even though having originated in hybridization— in order to maintain a particular breed or mix. But the maternal geneaology, at least and especially, but also the genetics of other men, will often have come from multiple sources, an example of hybridization and multiregional genetic input. While the paternal line might define an ethnicity, it does not necessarily compose it. It composes the ruling family, but not necessarily every family, particularly when it comes to nations. Tribes are often

[416] William Diller Matthew, who had held that Tibet is the forcing grounds of evolution, had also maintained that humans had origins in Asia, though not in the maritime Southeast

[417] Some called the Australian aborigines *Original People*

small enough that their associated ethnicities inbreed enough to establish at least some familial interweaving throughout time, even if never successful in completely eradicating rival genetics. Whatever facts exist behind these ideas can be incorporated into the paradigm of multiregionalism, which understands human evolution to take place largely by way of hybridization.[418] Particularly influential members may still engage in hybridization efforts with less influential ones.

It is well-established by now that modern humans have a genetic heritage coming from places as diverse as *Homo eretus, Homo heidelbergensis*, Neanderthal, Denisova, *Homo longi,* and some "ghost species" that are yet to be discovered. This sort of multiregional hybridization is likely to have occurred within the confines of cults found especially within convergence zones, wherein shared values or totems would break down other barriers. There is evidence of Neanderthal, for instance, having participated in the Cult of the Bear, that modern-day *Homo sapiens*, such as the Sami, Nivkh, and Ainu—indigenous people of Scandinavia, Siberia, and Japan— continue with today, and that Cro-Magnoid had also at least speculatively participated in, as most famously explored in the epic novel by Jean M. Auel, *The Clan of the Cave Bear*, and as supported by evidence such as arrangements of bear skulls and cave paintings.[419] That people of today, themselves often sharing Neanderthal genes, came from ancestors who shared in the Bear Cult with Neanderthal, seems to suggest that hybridization may have been concurrent with shared membership in cults.[420] Such cults would likely consist of particularly intelligent samples from the various archaic human populations, bringing together a particularly brainy bunch. If such a bunch were to have taken part in genocide of those outside of their cult, it would result in an increase in sapience for the hybridized subspecies. Could this have something to do with the origin of *Homo sapiens*?[421]

One hint that it does, and that knowledge of this has been preserved in secret societies, is the manner in which *race* has been spoken of in the past, as well as in some contemporary understandings. For instance, for thinkers such as Herbert Spencer and Pierre Proudhon, and just about everyone else of their time, *race* meant something more like "ethnic group" or "nation," at least as connected to culture as to biology, and, for occultists such as Manly P. Hall in *The Secret Destiny of America*, *race* refers to such things as a "philosopher's city" established from "citizens whose mental excellence would entitle them to a world citizenship." For Hall,

> The international nation—the dream of the future which has been inspired by the terror of modern warfare— would have its natural beginning in a union of superior intellects. Art knows no race; music is a common denominator; biology and physics are served by explorers into the furthermost and innermost secrets of nature. When we recognize that the poet, the scholar, and the savant are indeed a race inhabiting the suburbs of a superior world, that they are the noblest of our creatures, we can know that we honor ourselves most by honoring them.[422]

Manly P. Hall is famous for his expertise in Freemasonry, members of which— such as John Yarker in his *The Arcane Schools*— claim for the fraternity a lineage going back further than a now-lost Atlantis, a place mentioned by Plato, and the Cabiric Mysteries.[423] True or not, Freemasonry boasts ancient

---

[418] It is to be noted that Carelton Coon downplayed geneflow too much, in comparison to his anticipants

[419] The bear, often respected for its traits as a mother, similar to the cow, was likely later revered alongside Venus figurines as a feminine and maternal figure

[420] In his *The Arcane Schools*, on page 39, Master Mason John Yarker traces the mystery schools to the very ancient Cabiric Mysteries, and says that "their chief constellation was the Great Bear, the seven stars"

[421] Such an origin would involve assistance from climate change, as this would give an edge that didn't previously exist to those associated through cults

[422] Hall[1], 50

[423] *Cabiri* is understood to mean "friend" or "associate"

wisdom. If Manly Hall's use of *race* above—which coincides with early anthropological and sociological notions of *race*— is an indication to us of tradition passed on within Freemasonry, it is a tradition that understands *race* in hybridized terms, not unlike the hybridization that is likely to have accompanied participation of *heidelbergensis*, Neanderthal, and possibly Denisova in the same or parallel fraternities and sororities, or cults.[424] And, if truly tradition, this sort of self-managed intraspecific selection comes from a very deep past that is perhaps responsible for a substantial degree of our sapience (as well as for the protective behavior toward bloodlines within ruling classes).

Human Mind

The human mind has long been of interest to philosophers, going back as far as Thales and his fellow Greeks and Buddha and his fellow Indians. Anaxagoras, Plato, Hippocrates, Aristotle, and myriads of others addressed concepts in psychology, as did Augustine, Thomas Aquinas, and Joseph Butler. Thales suggested that God is the mental force that shapes things from water. Anaxagoras likewise suggested that mind, as *nous*, is the ordering force of the Universe. Buddhists regularly discuss concepts relating to *sentience* or the ability to perceive, and *consciousness*, one's being awake. While Hippocrates, the famous physician, believed that mental disorders were from physical conditions rather than being simply related to possession by spirits, Plato and Aristotle had also engaged in the philosophy of mind. Plato held that categories exist not in the sense of phenomena, but as *noumena*, as ideal existents. Plato held that the soul is non-physical, distinct from the body, eternal, and perfect or good, whereas the body is temporal and flawed or bad, the soul being trapped in the body.[425] Aristotle held that we are happy when we are virtuous, and that we are virtuous when we know, when we believe what is true. For Aristotle, then, happiness is dependent upon *Reason's* capacity—that of an understanding of cause and effect— to guide us to right behaviors, from which we benefit. St. Augustine, the medieval Franciscan theologian influenced by Plato, opposed the skeptics of his day and believed that *testimony*, the statements of others, even if one lacks a reason to believe it, can have value in an analogous sort of manner, and that God, the highest Truth, can be known by way of scripture or *introspection*, self-examining one's own thoughts and feelings. Thomas Aquinas, a Dominican[426] who followed in the footsteps of Aristotle, believed *conscience* to be the application of knowledge to the world.[427] Joseph Butler, following Aquinas, believed that *conscience* is the supreme moral authority. He held further that conscience was a direct connection to God, representing a sort of command center of moral behavior. For Butler, conscience was above the law of humans, and so was the foundation of natural law in society. Butler said that there is conscience, but then there are also impulses that are either self-loving or loving toward others, upon which the conscience reflects, which are also subject to various particular driving forces such as hunger, thirst, lust, yearning, and so on. The drivers are subject to the impulses, the need to satisfy or secure satisfaction of these needs for oneself as well as for others, and these impulses are reflected upon or considered by the conscience, which ultimately rules on what is good and what is bad, right and wrong. The conscience desires to please both the self and others, which are often coincidental.

There was also a more radical side. John Scotus Eriugena, for instance, argued that authority comes from Reason, and that this should not be confused for the reverse. He believed that we co-create the world with God. Nicholas of Cusa held that though God was beyond our capacity for Reason we could

[424] This would imply a great deal of agency in the direction of our own species' evolution. Do these sorts of secret societies see themselves as curators of our species?
[425] This is similar to some gnostic beliefs. In such a case, death sets one free.
[426] Franciscans tended to favor Plato, Dominicans Aristotle
[427] The evaluation of judgement of past actions, the awareness and judgement of doing something in the present, and discernment about what to do in the future and how to do good actions opposed to bad actions

nonetheless *conjecture* about God, to make unproven statements based on observations— what would later be known as *abduction*—, allowing us to point to and clarify the existence of God despite God's being beyond our capacity for full comprehension. Giordano Bruno, considered by many the first *free thinker*, the first to consider truth independent from authority, argued that only small minds limit themselves to the conjectures of the majority, because truth exists independently of what majorities think. He believed that strong deductions could come from limited information. However, it may be that psychology had its proper modern beginnings in the work of Baruch Spinoza, who followed in the radicalism of Bruno. Baruch Spinoza, who anticipated much of psychology to come after him, held that Nature itself had a mental attribute to it. He held that through an effort of rational thinking, by knowing the reasons for the causes of one's difficulties, and by changing things that brought agony to one's life and seeking out pleasures, and most essentially by pursuing a loving comprehension of God (who is Nature), one could calm the passions and establish peace of mind. Spinoza addressed cause-and-effect as it regarded the human emotions, suggesting that such things as love and hatred were fairly inevitable and necessary results of being offended or assisted in one's life, and that there was no such thing as free will, but that freedom could nonetheless be attained by an exercise of one's will in accordance with the will of Nature, which is God. Spinoza, taking up the free thought mantle from Bruno, would be followed by other free thinkers, such as John Toland, Matthew Tindal, and Anthony Collins, who shared many of his views. For Thomas Reid, though one may be mistaken through the use of one's senses, the senses interfaced directly with the world and, the more they cohered with one another, the more dependable they in fact were. He made the case that common sense was not something that was subject to being proven, because it could be taken as a brute fact, an axiomatic fact of reality without which sense-making was essentially impossible. That we can rely at all on our senses, Reid would suggest, demonstrates that they correctly perceive reality. His position was called *Common Sense Realism*. Herbert Spencer suggested that the mind had been filtered through natural selection, adapting to the environment, perhaps most importantly the social environment. He focused especially on the adaptive capacity of the human mind and on the increasingly complex forms that human physiology and consciousness was taking as a result, combining insights from both rational philosophy and *phrenology*, the study of the human skull as it relates to character and race. He believed the savage races to be inequal to the civilized races, most especially the Englishmen, whom he believed to be capable of the most complex forms of thought. Those other than Europeans and their relatives, Spencer would point out using a number of sources, had difficulty with higher thinking, though they often excelled white children in earlier stages of development. His views would greatly impact the pragmatic philosophers, such as Charles Sanders Peirce and William James, as well as the crowd psychology of Gustave Le Bon.[428] The radicals would bend some to the empiricists, however, upon their making of sound and cogent points about the world. In particular, there was the associationism of radicals such as David Hartley and James Mill, as influenced by empiricists such as John Locke. *Associationism*[429] is a view in psychology that points out that ideas become associated with concepts by way of experience. Positive and negative experiences associated with a given stimuli will charge one's opinion negatively or positively. If one fails every time one attempts something, for instance, the task will begin to be associated negatively with failure. John Locke held that some of our associations produce irrational or unjustifiable results, but that we make them anyway. Education and culture, Locke suggests, are means of establishing connections between ideas.

[428] Le Bon described crowds as having a mind of their own, reflecting the race and culture of the participants, but becoming something beyond them to which they surrender their own capacities for Reason, becoming driven instead by foolish sensibilities

[429] Not to be confused with *asssociation*al*ism*

John Locke had also argued against rationalism, such as that of Spinoza's, however. He said that the mind was a blank slate, or *tabula rosa*, that received the psychological imprints from experiences of sense impressions. He, along with others, such as Immanuel Kant and George Berkeley, argued against the direct-realism that would characterize thinkers such as Spinoza, Reid, Spencer, Peirce, and James, and for strict empiricism or, in Berkeley's case, idealism. Locke and the others held that, because information is transferred by the senses, that external reality could not be perceived directly or even at all.[430] Further, they held that this placed limits on Reason and rationality, placing more emphasis on emotions and sensations, a position that would come to be known as *sensibilism*. Some of the views of Locke and the other empiricists, especially those such as David Hartley and James Mill, were acceptable to the free thinking direct-realists, however. Reid, Spencer, Peirce, and James would be forced to addressed the sensibilism of the empiricists, coming up with their own solutions surrounding common sense and pragmatics, in defense of conscience.

Thomas Reid argued, to the contrary of indirect-realism and idealism, that it was common sense that reality was perceived directly, that without a direct perception of the world one could not go about basic observations of it, and that, then, the entire enterprise of philosophy would be senseless because philosophy is the making use of observations as if they are dependable sources of information. This really pointed to the Sophistic conceptions that were being embraced by the sensibilists from the mystical side of Islam, Sufism. Charles Sanders Peirce held that the senses were fairly direct, as demanded by natural selection, but pointed to areas where sensibilists and idealists, who held that external reality could not be experienced directly or at all, had some ground to make their claims against direct-realism. Peirce rejected the quest for absolute certainty and *a priori* knowledge, focusing instead on probable knowledge. This was a sort of *critical common sensism*, whereby the Common Sense view of Thomas Reid was addressed by a greater degree of fallibilism that is refined through evolution, as with Herbert Spencer.[431] William James suggested that one's consciousness is contextualized by previous experiences and so ideas were unique to individuals given their contexts and their own streams of thought. William James demonstrated quite clearly that the brain was largely *plastic*, in that it was self-malleable, could make connections to satisfy the demands of the will. He focused on the importance of being mindful and on forming good habits, considering rote actions to be fairly involuntary or mechanical, but of much benefit if well-directed and maintained. As such, placing one's conscious focus on the formation of good habits could put one ahead in life. He believed it best to consider psychology alongside physiology, and held that one responds to stimuli first in one's lower physiological systems, such as the heart, which then informs the brain to what emotion is to occur, such that one responds to stimuli before the associated emotion occurs. For James and the pragmatists,

[430] This was a view that meshed well with Sufi- or Sophist-style mystic reasoning

[431] Peirce's critical common sensism, which combined fallibilism with common sense, to some extent rejected the absoluteness of one's direct connection to the world through the senses, and in this way challenged Common Sense Realism, but it also rejected Kant's idealist understanding of *a priori* knowledge, and so could not be considered to be a form of sensibilism either. Instead, Peirce suggested that the mind makes idealist inferences from out of objective contributions. He defined the concept of *abductive reasoning*, which he basically equated to hypothesizing or presuming, a guess to account for facts as they have been experienced thus far. Peirce was a founding thinker in *semiotics*, the study of *signs*, signals of communication.[431] He held that generalities were real, in the sense that they could be referred to independent of the individual's particular senses, as illustrated by a blind man and a deaf man agreeing to the occurrence of an event, such as a murder, based upon different sensations (the blind man hears it, the deaf man sees it, both agree a murder has taken place, and so making the murder, in the general and not only specific sense, real). Peirce would be influential to William James.

matters of truth should be treated as working hypotheses, with what works best being understood to be what is true for a given time.[432]

One of the important ideas that came out of the discussions of the rationalists and empiricists, and championed by the pragmatists and those to follow, was that of *cognition*, the capacity to take in and understand information from the senses. Ancient philosophers such as Aristotle and those to follow after him had also been interested in the topic, but it started to become fleshed out come the time of the Enlightenment and with the debates between the rationalists and empiricists. Increasingly, the work of the rationalists, empiricists, and especially Spencer and the pragmatists was beginning to harmonize with the physiological and neurological efforts of doctors long before, such as those of Thomas Willis, who described the pathology associated with epilepsy, and Robert Whytt, who studied the nervous system. Pierre Janet a founding thinker in psychology alongside Herbert Spencer and William James,[433] and well known to James, notably studied the subconscious, psychological dissociation, and traumas, as well as sleepwalking and the relationships between hypnotists and their patients, including *automatism*, unconscious actions performed, often at the suggestion or direction of others, while dissociated. He argued that psychological dissociation is a defense mechanism against being overwhelmed with traumatic experiences. The Trauma Theory, as posed by him, posits that mental disorders are stimulated by traumas such as physical, sexual, and mental abuse during childhood, correlating to issues such as depression, anxiety, and psychosis. The pragmatists were also assimilating what they could of these ideas. Sigmund Freud would curiously develop the Trauma Theory into what he oddly called the "*Seduction Theory*," in which he posed that children were being sexually abused by (and seducing) their parents, an idea he later greatly downplayed in favor of the view that the children were all lying. David Bakan, an author on child abuse and psychology, wrote *Sigmund Freud and the Mystical Jewish Tradition*, which showed the Freud's psychoanalytical ideas were inspired by the Jewish *Zohar*, and that child abuse is a part of this tradition, suggesting that Freud was a crypto-Sabbatean, a follower of Sabbatai Zevi, who claimed to be a Jewish messiah and that moral transgressions were a means of spiritual progress. Jeffrey Moussaieff Masson suggests that Freud rejected his own seduction theory because he refused to accept that sexual violence occurred within families, and because it would have been difficult for his career to have maintained the idea. Florence Rush had previously advocated for the idea that Freud had hidden and downplayed the sexual abuse of his patients in a coverup of incestuous sexual abuse. Fathers were often named as sexual abusers.

The legacy of Spencer and the pragmatists would give way to others, such as the Edward Thorndike and the connectionists, and social psychologists such as Norman Triplet, John Dollard, Neal Miller, Leonard Doob, Orval Mowrer, Robert Sears, Nicholas Pastore, and others in frustration-aggression research. Others would also get involved in social psychology, such as John R.G. Dyer, Anders Johansson, Dirk Helbing, Iain D. Couzin, and Jens Krause and their experiments on consensus decision-making. Those to follow after Peirce and James were influenced also by their competitors in *experimental psychology*,

---

[432] While arguably a form of direct-realism, this was nonetheless a subjectivistic definition of *truth*, rooted in psychology and in a pluralistic cosmology that James would have a hard time reconciling with many of his other beliefs, which otherwise included a tendency to neutral monism, pantheism, and anarchism that he seems to have struggled against for some reason. Nonetheless, there is much to glean from William James.

[433] But eclipsed by Sigmund Freud, who acknowledged his debt to Janet but also stressed a difference of opinion on the matter. Janet noticed Freud name-stealing of *psychoanalysis* from his own *psychological analysis*. Carl Jung had also been influenced by Janet. Freud had attributed differences between himself and Jung to the fact that Freud was Jewish and Jung was not. After all, Freud was ethnocentric to the core, and joined the B'nai B'rith the year that his father died, saying that "many dark emotional powers all the stronger the less they could be expressed in words, as well as the clear consciousness of an inner identity, the familiarity of the same psychological structure [...] So I became one of you."

which is based around the performance of tests, especially as led by Wilhelm Wundt, another early thinker in psychology.

A student of William James's, Edward Thorndike would establish the idea of *connectionism*, the idea that mental units, such as concepts, combine to form connections that establish greater conceptions. Thorndike's connectionism, while not a neural theory itself, functions analogously to neural connections in the brain, whereby individual synapses form neural connections. Thorndike believed that natural rewards and consequences were of utmost importance to the learning process, as creatures learn through a process of trial-and-error. Edward Thorndike's *Law of Effect* says that rewards increase the likelihood of repeat behaviors, whereas penalties decrease the likelihood of repeat behaviors. An action can be rewarding in itself or the reward can be associated with a correlating event. His *Law of Exercise* says that connections must be maintained through practice or they are lost. His *Law of Readiness* says that the learner will be satisfied in the making of connections if the learner is ready to learn.

Norman Triplet demonstrated the concept of *social facilitation*, that people in presence of others perform better on their tasks, leading to the establishment of social psychology. *Social psychology* is interested in the causal or corollary relationships between social circumstances and mental states.

John Dollard and others in the field of social psychology have shown that aggression is mostly caused by frustration and anger. People store their frustration, first as anger. If someone frustrates another, that person is likely to act in a variety of ways, but the anger must be released somehow. They let it out on the person causing frustration if possible, but in the case they fear the results they let it out on someone else, and usually someone they associate to the frustrator somehow. John Dollard and his colleagues have shown that misdirected aggression occurs when there is a fear of reprisal or punishment.[434] This research was done to understand interpersonal race relations, particularly areas of conflict. Nonetheless, it can also establish socioeconomic insights.[435]

Another cause of aggression is having an advantage over others. If someone has more money, resources, or abilities, they are more likely to aggress on another person for the sake of personal gain. Further, aggression can be avoided altogether. Nicholas Pastore demonstrated that frustration could be thwarted and kept from developing into aggression if the reasons for the frustration are comprehended and empathized with, that is, if the frustrant had an excusable reason for causing the frustration that is known to the frustrated. Relatedly, if one doesn't understand cause-and-effect or stimuli-and-response, occurrences will appear to be random, and it will appear that things occur for no apparent reason, rather than according to laws or principles. If one doesn't understand causality, one may believe that the world operates according to luck, and that continuing poor behavior might produce different results at some point instead of following laws, further exacerbating one's problems. This will cause frustration. However, by knowing the causes, peace of mind and solace may follow.

When confronted by aggression, humans can react in a number of ways, including the commonly acknowledged *fight or flight*, described by Walter Bradford Cannon, and the lesser-known *freeze or*

---

434 See Dollard, *et al.*

435 One can't release their anger on one's boss, creditor, or landlord when something happens. Those people hold authority over one's life. One wants to, though, and the second best option is someone we associate to them somehow. Ideally, this would mean another person with authority in one's life who would be able to cause more frustration if one acted against them. But instead one must settle with someone else entirely and this creates a vicious cycle of aggression in one's own class, because its members release it on each other, the abiders of the system.

fawn, established by people such as Peter Walker. In other words, people can confront the danger, run away from it, shut down, or try to win the threat over through appeasement.

Experiments in social psychology, such as by H.A. Dengerink and J.D. Myers, have demonstrated that people assert themselves when they come across success in their lives. In this case, relatively similar individuals were unknowingly given separate challenges, some of which succeeded at the challenge and the others failed. After the tests they were put in a situation where an individual attacked them with increasing intensity. Those who succeeded on the previous tests tended to react to increasing aggression with increasing counter-aggression and those who failed tended not to increase their counter-aggression, or defense. Those who passed gained confidence from success and confidence increases ones internal locus of control.[436]

According to J.B. Rotter, the *internal locus of control*, determination of one's own actions, exists when an individual believes they have the power to create change in their life. The *external locus of control*, forfeiting one's determination to another, occurs when an individual feels that it is out of their control.[437] Dengerink's work suggests this largely comes from failure.[438]

In an important experiment, John R.G. Dyer, Anders Johansson, Dirk Helbing, Iain D. Couzin, and Jens Krause took groups of volunteers and gave them rules: they were to stay with the group, not to communicate, and not to be any further apart than arm's length from one another. There were letters on the floor and those conducting the study secretly told select individuals of the group, a small minority, to find their way to a specific location. The results showed that those who were given a location led the rest of the group to the stated location without breaking away from it and without any communication other than asserting themselves toward the goal. When individuals were given separate locations, the group split up evenly relative to the number of leaders. Because they had this information, they asserted themselves and the group followed.[439] When the individuals who were selected to work toward a particular destination were told to do so, they were given a form of information that the rest of the group lacked: the destination itself, a goal. This demonstrates that knowledge is, in fact, power. Humans have a tendency to follow, whether in groups or as individuals. It's been said that we are inherently pack animals. This is rational for us because we have a society based on the division of labor. The division of labor allows us to specialize in areas of knowledge so that we can become valuable to others. As a result, we tend to follow those people who assert themselves and have confidence in what they are doing with their knowledge.

Another strain of thinking, developing from out of Herbert Spencer's and the Pragmatists' manner of thinking, is *evolutionary psychology*, the consideration of psychology from the perspective of human evolution, involving insights from ecological, sexual, and social pressures, among others. *Comparative psychology*, following the evolutionary psychologist George Romanes, involves the study and comparison of animal psychologies. Famously, and shamefully, Ivan Pavlov tested on dogs, showing that responses can be *conditioned*, that a dog can be programmed to expect a certain association with a given phenomenon, such as a human and food, and so elicit a response in anticipation of a false event, such as being fed, demonstrated by a dog's drooling in the presence of a human that normally feeds it but who nonetheless has no food. He also studied stress that he put the dogs through.[440] William

[440] What's worse? He performed similar experiments on orphans, but, because they were not as willing, he forcefully tied them down to chairs and force-fed them. Wendell Johnson, another psychologist, abused orphans

McDougall, however, originally used the term *evolutionary psychology* in reference to *social psychology*, the study of psychology within the context of *sociology*, the study of society. He himself had suggested that inherited instincts can cause confusion to the individual with those instincts, which may seem irrational or appear as strange compulsions because the source of their having been inherited is unknown. Today, however, evolutionary psychology is dominated by names such as Robin Dunbar, whose primary considerations include the evolution of language and the effects of group size, and Michael Tomasello, whose evolutionary psychology combines elements of comparative psychology and *developmental psychology*, the study of the development of psychology (as popularized by John B. Watson), comparing the psychologies of primates and human infants.[441]

Unfortunately, today, psychology is associated mainly with the efforts of Carl Jung and Sigmund Freud, both of whom produced a number of interesting but often not terribly useful concepts, together called *psychoanalysis*,[442] or with those of B.F. Skinner and his *behavioral psychology*, which, following in the tradition of experimental psychology, studies the reflexive behaviors of people as affected by their environments, or with those of *Gestalt psychology* of Frankfurt Schoolers such as Max Wertheimer, Wolfgang Kohler, and Kurt Koffka, which studies fields of perception. These fields have become popular largely for purposes of manipulation and control, suggesting insights into ways that external forcing and deception can be used to accomplish results desired by authority. Interestingly enough, this may itself be psychoanalyzed as a form of narcissism or psychopathy. *Narcissism,* as used by Paul Nacke and Havelock Ellis, originally referred to autoerotic fixation that pervaded a person's entire being. Ernest Jones considered it to be a "God-complex." But Robert Waelder would describe it in less sexualized and mythological terms, as a personality trait that encompassed extreme selfishness, egotism, dominance, and other toxic conditions. Narcissists can range from *overt* and *grandiose*, in which case they can be readily identified, to *covert* and *vulnerable*, in which case they are hard to see for what they are. Karen Horney would suggest that narcissism ranges on a scale from being a healthy degree of self-esteem to being a complete pathology, believing that unhealthy narcissism had to be cultivated by an interplay of nature and nurture. The lack of a healthy degree of self-esteem, Craig Malkin has called "*echoism*." *Alruism* would be a fine word, except that covert narcissists use apparent acts of altruism as part of their overall project. Echoists do not look out enough for their own interests, a response gained from oversaturation in environmental narcissism. There is also a phenomenon known as *collective narcissism* and a correlating *collective echoism*, whereby the individuals feed off of one another and behave more narcissistically or echoistically than if alone.

A related concept to narcissism is *factitiousness*, which is characterized by pretending to have some association with a horrible ailment or problem. For instance, those with Munchausen Syndrome will intentionally fabriciate or feign illnesses or injuries—sometimes even self-inflicting them—in order to

---

in the "Monster Experiment" and even caused them to have speech impediments after claiming they had them, otherwise being non-existent before the abuse.

[441] These experiments are nothing like the "Monster Experiment"

[442] Carl Jung described concepts such as a *collective unconscious*, the idea that there is a sub-mental phenomena that is shared between all humans, in which *archetypes*, or abstract or symbolic notions about roles, and *instincts*, innate programming, inhere and operate. He also described the concepts of *introvert* and *extrovert* among others that would be used by thinkers such as Myers and Briggs to establish personality type indicator tests such as the Myers-Briggs, diving personality types into sixteen forms and four major categories according to rational-idealist, dichotomous categories. Sigmund Freud proposed that the mind has three major parts, an *id*, or self-driven or narcissistic part, a *superego* that is socially-driven or altruistic, and an *ego* the duty of which is to balance the demands of the id and the superego such that daily living can be achieved. He famously established his concept of the *Oedipus Complex*, that one's primal male instinct is to kill one's father to have sex with one's mother. Carl Jung attempted to balance this idea with the *Electra Complex*, the idea that one's primal female instinct is to kill one's mother for one's father's bed. Freud suggested that there was a sexual drive called *libido* that established erotic desires, an apparent "death drive," as well as aggression and neurosis.

gain sympathy from others. Those with Munchausen by Proxy will intentionally cause harm to others so that they can share in the misfortune, and whatever opportunities that are perceived to come with them. For instance, a parent with Munchausen by Proxy may intentionally and secretly cause harm to their children so that the parent can receive sympathy for it. Factitiousness might be said to be a characteristic also within postmodern approaches to psychology.

Other concepts related to narcissism include psychopathy and sociopathy, both of which entail an extreme lack of moral inhibitions, up to and including uninhibited criminal behavior such as fraud and violence. *Psychopathy*, in particular, seems to be more ingrained, whereas *sociopathy* appears oftentimes as a learned psychopathy.

Narcissism, factitiousness, sociopathy, psychopathy, and even to a lesser extent things like echoism can be understood as character disturbances. *Character disturbance*, suggests George Simon, occurs when a person's character is pathological, and represents an absence of *neurosis*, or the capacity to experience inner anguish like guilt and shame (conscience). Character disturbances are basically always caused by environmental and nurtural factors, and correspond strongly to family abuses, especially during developmental stages of one's life.

Thankfully, Ulisse Di Corpo and Antonella Vannini have developed a psychology based upon syntropy, pointing out similarities to perennial ideas such as that of Aristotle's Fourth Cause, the *telos*, Plotinus's Source, and advancing concepts similar to those of William James, suggesting that heart-response and skin-conductance experiments demonstrate empirically that one's physiological processes respond before an action is taken. Together, and building upon the work of Luigi Fantappie and others, they have successfully demonstrated that such things as meaning, purpose, and emotions are sourced in the future, the reasons for their existence being *retrocausal*, or time working backward (relative to entropy, the thermodynamic arrow of time). Di Corpo's Vital Needs Model suggests a contrast between the heart and that of the brain, pointing to the heart as the source of the emotions, which tell us about what is syntropically best for the future, and the brain as that of cognition, which suggests to us means of entropy-avoidance.[443] In ethics, this dichotomy seems to come out as one between an idealistic or rationalistic effort to make things better and a materialistic or empirical effort of harm-reduction, both of which are necessary for survival. Interestingly, despite our nature being syntropic, our entropic environment gives cause for us to balance the demands of our feelings with those of our environment,as Di Corpo has suggested. Di Corpo and Vannini refer to the ability to choose between the ideal and material demands on us as *supercausality*, which they consider to be related to free will.[444]

In response to some of the behavioral psychologists, and particularly their effect in economics—behavioral economics—, Ronald Noe, Jan van Hooff, Peter Hammerstein, and others, instead pairing evolutionary psychology with economics, demonstrate that one's emotions are not so distinct from rational decisions such that a strict line can be drawn between them. Instead, their work might suggest that the emotions, treated as instincts, are the long-term "rationalizings" of our species, that "rationalizing" that has become genetically rote, perhaps. As they suggest,

> Introspection on how we proceed ourselves on many occasions suggests that the mental bookkeeping involved could be done at a level of emotional evaluation. The common currency into which the benefits and costs of social acts are translated is feelings of relative sym- or anti-pathy: you like better or worse those who treat you better or worse, and you are emotionally inclined to treat them accordingly. In man

> the emotional attitude of trust in the relationship appears to be a condition for keeping the cooperative exchange going.

They say,

> The maintenance of relationships of mutual benefit should be weighed off against the benefits of short-term competitive advantage.[445]

Di Corpo and Vannini, as well as evolutionary psychologists and pragmatists such as Herbert Spencer, William James, Robin Dunbar, and Michael Tomasello, not to mention the classic rationalists and empiricists, and I do believe that, from a subjective orientation, there does appear to be such a thing as *free will*, will free from external control. Naturally, as I understand things, psychologists will tend to orient their insights from subjectivist or relativist standings, and this is completely reasonable within the specialty of the field. In this, there is also some agreement with objective and inductive looks at psychology, which often explain inductive insights into psychology and social sciences in terms of *free will*, that is, will free from determinism. However, and while syntropian and pragmatic insights remain, I do nonetheless believe Spinoza to be correct in orienting the psyche, though phenomenally contingent, in the Absolute and the Necessary. In so doing, he too avoids absolutist claims regarding classical determinism, allowing for causes of mind as well. From a position of Spinoza's natural philosophy, it would appear that supercausality, otherwise explained by "chance," is not distinct from Necessity, but that supercausality occurs when one takes active and conscious part in Necessity, thereby allowing one to take part, from an experiential or phenomenal standpoint, in evolutionary self-direction. This, of course, is not true self-direction (though it may be said to be Self-direction, perhaps) from the position of philosophical necessity, but in the sense of being free from mechanical determinism or external forcing, and in the sense of being able to establish novel and new things in the phenomenal world. A true use of Reason, then, is not one that picks sides between the emotions and the intellect, but one which recognizes that each of these provides reasons of their own, *Reason* being all subsidiary reasons, all causes and retrocauses, considered. *Reason*, then, must be seen as an effort to satisfy the emotions through the experience of love (syntropy) and the intellect by ensuring one's safety from hatred (entropy), which themselves are emotional states that correlate as relations with external conditions.That which pleases us, which we love, nourishes us in some way (even if for the short term at the expense of the long-term), and so is syntropic, while that which we hate diminishes us in some way (even if for the short term to avoid a longer-term diminishment[446]), and so is entropic.[447]

While consciousness moves backward in a sense—in that goal-setting-and-meeting works from future to past—, and can then be said to move from multiplicity to singularity, the material body shares the physical origins of the rest of the physical Universe, going from singularity to multiplicity. The going from singularity to multiplicity, which involves the breaking apart of things, giving relativity, subjectivity, and mortality, is called *entropy*; while the movement from multiplicity to singularity, involving the piecing of things together, giving absoluteness, objectivity, and immortality, is called *syntropy*. Life involves both entropy and syntropy, but our consciousness—a defining characteristic of our lives— is oriented especially by syntropy, a desire to experience completeness, wholeness, and togetherness.[448]

---

[445] Noe, van Hooff, and Hammerstein, 83

[446] Like a visit to the Dentists's office

[447] Even if reduced as in negentropy

[448] This orientation, of course, is limited and not absolute, as we wish to approach this at a rate we find suitable to us. This is by design, of course. Mortality which does not play out is hardly mortality at all! Naturally, in our pursuit of togetherness, then, we still cling to individuality.

While consciousness is embodied, and from within every body, it experiences *psychological time*, the passing of time from the frame of the phenomenal past to that of the phenomenal future through an ever-occuring present.[449] As a result, the past appears fixed, and is in fact determined by entropy, while the future appears open to us, but in fact is determining us retroactively. The future appears open and undetermined because it is unpredictable and undetermined by entropy and because it, unlike past events, has never been made visible to us; what we are not aware of appears to us as possibility. But this is quite mistaken, as everything is established ahead of time.[450] Your goals, for instance, which drive you to act, exist before you are aware of them. For example, this was demonstrated by the Libet experiment, which showed that scientists, by connecting electrodes to the brain, could witness a choice being made before the test subject had been aware that they had even made one. This shows that choices do not originate as is often thought, that we do not "make" the choice, rather that the choice "makes us," as by causing us to act or resolve a matter. We are merely witnesses of this "choice."[451]

Because everything is established ahead of time, *freedom of will* is non-existent, a figment of the imagination. However, this does not mean that we are subject to pure determinism and fate, that we are pinballs being rolled around by mechanical forces. Rather, due to the syntropic nature included in the cosmos, by which time moves in reverse, there are also spiritual or organic forces at play, of teleology and destiny. The difference between the experience of the two, of destiny and fate, is the difference between being aware and successful and being ignorant and facing failure. And this difference correlates to a different experience within the Universe, of being happy or sad and angry.[452] Just because we don't have free will doesn't mean that we don't have *will* itself, though. Of course we do! *Want*, or *will*, is an inherent part of the Universe, and it flows through us as the desire to achieve our destiny. But freedom is not the ability to choose our will, but the ability to play our will out, to be unimpeded in the pursuit of satisfying our will. We are free when nothing stops us from doing what we are *compelled* (or what we are unfree not) to do. In a strange way, our surface feeling of freedom is completely dependent upon Nature's compulsion. If we could choose what we will, we might choose not to will at all! Or we could do things like will ourselves to want to die, without any reason at all. But that isn't how it works! Suicide, for instance, requires certain circumstances, and has nothing to do with willing oneself to lose the desire to live, as "free will" would allow us to do. Suicide happens when the will to live has been made inadvantageous, when living merely keeps us suffering.

Our will is not truly free, it is coextensive with our goals of survival and pleasant experience (and our repulsion to death and displeasure, their opposites). We do have a "free" will, however, in the sense that the causes of the direction of our will—our goals— are ultimately unsourced from (though they may be

---

[449] This involves a cognition of phase transitions and a conscientious retro-determinization to carry this process on in the way purposed in one's life. However, it also involves a blindness of the five senses to half of Nature—that which is extended into the future, from which one's conscience arises—, such that the past has been seen, heard, felt, smelled, and tasted, while we are only made aware of the future by the anticipation of our conscience.

[450] At least, this is how we describe it in our Indo-European culture, which describes the future as being "ahead" or "in front" of us, "putting the past behind us," because what is ahead of us is what we have not yet reached, as we see it, and the things we have passed are in the past. In the Aymara language of Bolivia, however, the future is described as behind and the past as ahead, because the future is invisible to us, much as that which is behind us is.

[451] Before you "decided" to read this book, the cause of this decision, the goal, was already in place. This goal likely involves a desire to be happy, and you probably see knowledge as a means of acquiring that. That's just sound reasoning! After all, Aristotle says that "all men desire to know" precisely because knowing allows us to be virtuous—to make better choices—and so to be happy as a result.

[452] Once you know, life gets better. You didn't have a free choice in the matter, but doing what you wanted— what Nature made you want—, in the case that you wanted to learn, made your life better. While you have no say in whether to keep reading or put this book down, your choice will correlate to either determinism and fate, to entropy acting on you from outside, since you are not aware of what is happening; or to teleology and destiny, to syntropy acting from within you to coalesce Wisdom.

reacting to) the outside, but comes apparently from "within" us, as our desires. It is free, as it were, of simple physics. Freedom is simply the ability to do what we will, but what we will is teleologically determined by the ideal. When we accomplish our goals it is because we were drawn to them by future consequences, desires outside of our control. Actualizing those goals is constructing the Universe. As Ulisse Di Corpo and Antonella Vannini suggest, "[a]ccording to the law of syntropy the aim of life is to bring out the design and project which is already present in the attractor."[453]

Mental and bodily processes are different from one another, as is suggested by the psycho-physical parallelism of Baruch Spinoza, Gottfried Leibiz, and Wilhelm Wundt, for instance. Mental processes do not affect the body, or the material world of physics. And the physical-material world does not affect the mind, or the spiritual world. They do change at the same time, however, such that when one's body is damaged one feels pain, but this is not truly a causal relationship (though colloquially we all speak of it this way), but one of correlation. When one's body is damaged, it does not cause the mind to feel fear, anger, or sadness, but instead correlates to those feelings, which have been caused in another manner. All causation, instead, takes place through God, the Universe, —Substance— who and which is beyond the distinction of mental and material, causing all things among both to happen. God is the cause of all causes and the only medium between body and mind, or matter and spirit. As such, one does not affect the world through mental processes, but one sees correlating changes, typically in one's actions, which do affect the world. This being so, one's individual awareness, or *consciousness*, is unable to directly affect the material world, but merely witnesses corresponding changes as time passes. It is not the decision-maker, as all of the laws and conditions have been established from 4D and are now being played out. A change of mind, nonetheless, is likely to correlate with an obvious change of matters.

How does this correlation occur? Mind and body are not separate except as attributes. But they are attributes of a whole which unites them, makes them ultimately indistinguishable except arbitrarily so. When you see something take place, it occurs either from the past to the present, in which case it is a material-physical or entropic cause; or from the future to the present, in which case it is a spiritual-ideal or syntropic cause. Physical causes appear determined, with causes followed by effects. But, because spiritual causes are effects followed by causes, and so is the future acting on the past, they appear to occur randomly, without any determination at all, because the effects—which are in the future, before they become realized in the present— are invisible. You do see both spirit and matter, in that you do witness both deterministic and "random" phenomena; it is the "randomness" that lends syntropy to be considered invisible, despite Substance being witnessed. The effect of picking up a glass—the cause— is drinking, which drives the cause to occur. In other words, the cause is actually an effect of a future cause. One can see you drink, but cannot see the cause, your goal, the way they could see you if you were caused from outside to spill that drink, as by being bumped (which is visible, tangible, physical).[454] The bumping goes from past to present, but the goal runs from future to present and so is, as synropians point out, "invisible."[455]

Awareness, anchored in Substance (though oriented in the attribute of mind), is that of two aspects: the outer entropic and deterministic world of matter, which is comprehended through the use of one's

[453] See Di Corpo[3] and Vannini

[454] When operating on this level of metaphysics, and in dealing with duality, matters are actually *nondual*, meaning fundamentally indistinguishable, and so it is okay to describe matters in either way. So, it is okay to describe syntropic phenomena as either effects from causes located in the future or as causes which follow effects. Either way is acceptable, with only a difference in rhetoric. Because of the ability of duality to be reduced to nonduality, or oneness, though, it is possible to say that *All is One*, and that One, not Two, is responsible for everything. It is through One that the correlation occurs, that all is really caused by Substance.

[455] Also, entropy pushes from past singularity while syntropy pulls toward future singularity

cognition, or computation; and the inner and syntropic world of spirit, which is felt as one's *conscience*, discerning moral value and giving syntropic[456] direction. One's wakefulness has three fundamental modes: *consciousness*, or *awareness*, which simply spectates;[457,458] *conscience*, which discerns moral worth and provides intentionality; and *cognition*, which computes phenomena. *Intelligence* has to do with one's ability to cognize. Your awareness does not discern moral worth: that is your conscience at work. The conscience discerns the moral value of the data comprehended by the cognition, and is limited thereby in its successes, the reaching of goals. Together in resonance, the conscience and cognition give way to *sentience*, the *active awareness* of cognitive and conscious processes, the *seat of consciousness* oriented within an individual (and not just in the abstract), which feels and predicts pain and pleasure, and culminates in *sapience*, or wisdom. The more sentience, the greater capacity for happiness, because the more aware, the likelier to succeed one is. When the individual[459] succeeds, the awareness experiences joy. When the individual fails, it feels sorrow.[460]

The awareness may correlate to the *cognition* of entropy, understanding of a world that is breaking down, whereby much displeasure and loss may be experienced; or to the cognition of syntropy, a world that is coming together, wherein joy and gain present themselves. Likewise, it may correlate to *conscience* of entropy, a conscience which favors oneself at the expense of others or others at the expense of self (resulting from low sapience), whereby much displeasure and loss occurs; or by conscience of syntropy, a conscience that balances the needs of self and others (resulting from high sapience), whereby joy and gain are presented. The fundamental cleft between these is the difference between ignorance and understanding, sentience, or of lack and presence. When we have both well-developed cognition and conscience, we understand and are present, we know both *how* and *why* to do good; and when others have these, they too know both how and why to do good. When both parties know how and why to do good, when both are sentient to that degree, they may more easily reciprocate in doing good, and thereby do good for one another without being made to do bad for anyone in the process. This is the creation or increase of greater good.

The dual basis of all human actions and what the *ego*, or self, wills is the evasion of pain and the attainment of pleasure. All acts of the human will serve the twofold purpose of being carefree and happy, reaching "the Good." For this reason, Aristotle makes such statements as,

> Every art and every inquiry, and similarly every action and pursuit, is thought to aim at some good; and for this reason the good has been declared to be "that at which all things aim."

And,

---

456 Long- or short-sighted; macro-mutualistic (reciprocal) or micro-mutualistic (narcissistic/altruistic)

457 If you have ever sleepwalked, you have likely been unaware while nonetheless exercising your conscience and cognition, an example of the separation between them and your awareness.

458 Consciousness is to cognition and conscience as Substance is to mind and body in Spinoza's system. Wakefulness as a whole is part of the attribute of mind or spirit. This must further be correlated with the movements taken by the body, which is of matter. Mind and body are two separate attributes of the One Substance, and cognition and conscience are two modes of consciousness.

459 Please note that individuals are collectivies of cells and not truly individual except on the emergent level of the multicellular organism

460 One does not have any control over one's cognition. What one cognizes is a matter of directed focus, which correlates to conscience, and to sense or sensation. One has no say in sensation, or what one senses, either. One may place one's focus elsewhere, but the sensation will be there. Further, one doesn't have a say in their conscience, either; rather, their conscience has a say in them. That is, they do what their conscience tells them to do (to the degree it has its results and one is not fated but destined). Conscience is the driver, but serves sapience.

> If, then, there is some end in the things we do, which we desire for its own sake, [...] clearly this must be the good and the chief good. Will not the knowledge of it, then, have a great influence on life?[461]

He says, "[i]f there is an end for all we do, it will be the good achievable by action." All of our actions are taken for the purpose of making the future better, whether we are short-sighted and act in favor of the immediate future, or are fore-thinking and act to the benefit of the longer-term. Herbert Spencer recognized that it is our abilities that lead us to our ends when he said that "[m]an's happiness can be produced only by the exercise of his faculties." Humanity has a capacity for forethought and intuition that is so-far unrivaled to common knowledge. Because humanity is less affected by the outside than by its own internal will, our contentment, which includes the usage of that will, can *only* be obtained by the use of that will.

Sometimes, owing to lessened sapience, the computation of one's cognition is wrong, which misinforms the conscience, allowing it to do things such as tell white lies or deceive others when it is not favorable to do so, leading afterward to feelings of guilt or regret. These are feelings that Socrates, perhaps the most famous of Greek philosophers, suggests are to be avoided because they are punishments in and of themselves. But with a full comprehension, produced by exercising one's cognition in the service of the conscience, one can better inform one's sapience,[462] such that by way of correlating changes one's priorities can be better established and one can experience more consistent values that match with Nature instead of misunderstanding it; that is, such that the *How* can be given a *Why*. This allows for living a better life in the process, becoming aware of one's joy, which is experienced by way of awareness of the successes of the conscience. We experience joy when what is right is what happens. That's the correlation.

Individuals whom are of a greater quality focus on their sentience, but they have no choice in the matter. What is experienced as "choice" is retrodeterminism, the causes of the future (such as goals), having their effects on the individual. This is inescapable. An individual may respond to new information either with an intention to understand, a sign of high sapience and syntropic conscience, or with willful ignorance, a sign of low sapience and entropy conscience. But this is not up to the individual, whose life is laid out before them. Rather, it *defines* the individual, establishes their quality for others to witness.[463] And it has ramifications for their physical wellbeing, which correlates.

Conscious Evolution

Conscious evolution refers to the capacity of human beings to choose their evolutionary path, and so to decide what oneself or future generations will become. Proponents of conscious evolution have included people such as Herbert Spencer, Pierre Teilhard de Chardin, Henri Bergson, Ervin Laszlo, and Ken Wilber. Conscious evolution might also be styled as *creative evolution*, or God-guided evolution, particularly when understood through a theological or panpsychical lens. *Panpsychism* is the belief that mental properties, such as consciousness or intelligence, are present throughout Nature. This belief was held by many of the ancients, such as Thales, but also by modern thinkers such as Baruch Spinoza, Charles Sanders-Peirce, and William James. In conscious evolution is grounded intersubjectivity and creative novelty, as may be uncovered in the lives of bees, plants, and humans.

---

[461] Aristotle, 1

[462] Individual sapience does not have a causal effect on the cognition or conscience, but is more an indication of their being more highly coordinated. Cognition and conscience are only causally tied together through God, or Substance, as Spinoza would say, with cognition and conscience.

[463] Individuals of poor quality do not succeed in life and do not pass on their traits, genetic or memetic, to the next generation (this is not metaphysics, but biology)

The fact that humans and bees are both drawn by, and may appreciate beauty in, the same flower, demonstrates a degree of intersubjectivity or objectivity between us. Though bees and humans approach them differently, and may see different uses in them, that bees and humans have come to appreciate a similar sense of beauty at all is quite astonishing. Shared appreciation for the beauty of a flower, between mammals and insects, demonstrates some level of universal aesthetic truth.

Bees and flowers share an intimate relationship. Many naturalists argue that flowering plants and these social insects co-evolved, as part of biological mutualism. Others contend that bees came first, and fed on, as well as pollinated, older non-flowering plants such as evergreens and ferns. Regardless of which came first, we can see the intimate relationship that bees and flowering plants now share today. Bees rely on flowers for their nectar and pollen, and flowers rely on bees for their pollination. This is relatively common knowledge, but what isn't common knowledge is that bees are directly involved in the evolutionary direction of flowering plants.

Many of the flowering plants we are familiar with today would not exist if not for bees. Flowering plants put out their bright colors and designs to catch the attention of bees, in order to be pollinated or to pollinate others. Bees are directly involved in the sexuality of plants, and thus play a large role as a third party in their sexual selection. If not for the taste of bees in their selection, we wouldn't have such beautiful flowers. Don't bees have wonderful taste? If bees are *intelligent*, and they *are* depending on the definition being used, this is an example of intelligent design, although the designer is not anything close to resembling Zeus up there in the clouds.

Bees are not the only species to demonstrate the ability to affect the development of other life forms throughout their evolution. Most life, being part of a larger ecosystem, has this ability, as well as the capacity to be affected. In humans, social and sexual selection— the choosing of friends and mates— has led us greatly to where we are. As we choose sexual partners, friends, allies, etc. we are designing the future, by choosing the genes that are passed on. This is also done through cultural selection, whereby a society's memes can be preserved or lost. To put it simply, people and ideas who aren't nice have a hard time making friends and lovers, those who are not honest have difficulty finding business partners and allies. People who have a hard time making friends have a harder time surviving, and those who cannot find lovers will never pass on their genes, etc. That is, they are socially selected out through the lack of friendships, and are sexually deselected by lacking willing partners. Their current position will be unfavorable, and they are unlikely to pass on future copies of their DNA. Similarly, ideas that don't work don't get passed along.

Through culture, humans create archetypes by which to select the traits that we will move toward genetically. By creating social pressures, culture has developed a means by which humanity will select its own path in evolution. If it is the standard desired by society, the *norm*, to know how to whistle due to the fact it is used in the local language, as in Silbo Gomero and many more, for instance, individuals who know how to do so will be favored over those without the ability. The same can be said for our moral systems. In a society which values love and respect, those who are inclined to be caring and decent will be chosen by society as friends and sexual partners. The genetic material will be passed on favoring such choice of action, creating phenotypes exhibiting such a behavior. In a society where there is a dictatorship and strong class distinction, individuals will be selected out based on their noncompliance to government. This can have major effects on the movement of the species, especially if it occurs in heavy isolation, because it has the capability of genetically predisposing individuals to comply with authority, and thereby creating genetic castes in our species. What could happen if we were to consciously engage mutualism instead?

Another example of the affects of consciousness on evolution is to look at the function of artificial selection, where humans directly involve themselves in the selection of traits that are expressed in other organisms. Dog breeds are a great example. By selecting between already existing mutations, being unable to produce their own purposefully, humans mimicked genetic drift, creating different kinds of dogs. Humans have selected dogs artificially over the ages. We have created small ones for companionship, large ones to work, and those that fetch for hunting. We have also selected them based upon their ability to do well with our children and ourselves. Humans had ideas, archetypes, for ideal dog forms, capable of performing specific human functions, sometimes observed to some extent but not in a fully-expressed form. *That* would require artificial selection. Culture is the way for humans to make these choices about ourselves.

Unlike artificial selection, where we directly involve ourselves in the sexuality of other species, human social and sexual selection is internally-directed, based on our own decisions, goals, and desires. Humans tend to screen one another based on the ability to get along, share values, and remain healthy. We also tend to screen one another sexually based on such modes as the golden ratio, symmetrical relationships, among others. No single person meets the requirements of perfection, being physically and emotionally perfect, but it is the immaterial idea of perfection that still drives our decisions, and evolution, toward it. Perfection does not exist for us, but that does not mean that it never will, just that it is becoming. We are constantly judging reality around a notion of perfection, screening those parts of reality that stray the furthest from it, and accepting those parts that are nearest (as in genetic drift). It is in this way that we choose the form, but not the substance, of the future.

Through the achievement of our goals (environmental, social, personal), and by existentially giving ourselves purpose by accepting that given us by Nature, we are intelligent designers partaking in the influence of evolution, whether we are simply trying to get pollen to our hive like a bee, or we are trying to meet the complex environmental, social, and personal goals that we may set for ourselves as humans. Life is putting together absolute experience (lack of want), that little singularity that existed before the Big Bang, by setting and reaching its goals. Since energy cannot be created or destroyed, and the very same particles that make up our flesh have been on this Earth long before us, likely composing the brains and bodies of our ancestors and environment, we have largely sculpted ourselves through the process of natural selection long past gone. Our physical and emotional attraction to others today will do just the same. Just as bees have given us the beauty of flowers, when they pick the prettier ones to visit (and thus pollinate), our prehistoric ancestors chose from their own group's genes and memes when they chose friends, allies, and sexual partners. Over long periods of time and speciation, we now have humans, whom are much more beautiful than the apes we evolved from, and capable of much more cooperation.

We choose our future by the choices we make today. The mechanism of life is to live, to want, and to set goals to acquire these desires. To want, and to set goals for oneself, is an integral part of that, but desire, itself being a demand for objectivity of being and experience, should not stop with the desires of the self. We go further than the self when we establish the *we* when we marry, make friends, or incorporate with business partners, or associate in the market to create society. It should not stop here, however.[464]

[464] Over time, if life envelops the stars, it will be necessary to extend our sense of we to the newly awakened matter, just as we have extended our sense of I into we. As we do this we step out of identity and subjectivity and into interconnectedness, objectivity. As the Universe awakens, life is destined to culminate through its systems of goals in the desires of The All— God— and put the Universe back together. As we reach our goals and extend our

But don't get confused. You still don't have free will just because you choose your future. You choose your future but not your will that drives you to choose that future.

Races of the Stone Age

Humans have long noticed racial differences in one another and their attitudes and opinions about the matter have differed in place and time. This being so, humans have maintained some proclivity for inbreeding, perhaps especially after the development of social hierarchies, but have generally been opportunistic regarding chances for mating with one another, leading to a fair degree of racial hybridization that is responsible— at least, in part— for our evolutionary progress as a chronospecies. It is important to understand that genes can spread by proximity as well as by migrations. While a correlation between physical and cultural anthropology between different sites may be a strong indicator of migrations, genes can also be spread independent of culture simply through breeding that occurs in the buffer zones between people groups. As such, without any migration at all, genes can be passed along through different groups and across vast regions, so long as they are found to be beneficial for those endowed by those genes, or else are sexually selected for.

The first to attempt a serious scientific classification of the human races by physical characteristics—the first to attempt *physical anthropology*— was Johann Freiderich Blumenbach. Johann Blumenbach had been a monogenist, but believed that the non-Caucasian races had degenerated from a more pure form of human due to their environmental and dietary differences, having been removed from their homeland. This was before a scientific theory of evolution had really been established, as well as before Edward Burnett Tylor established the field of *sociocultural anthropology*,[465] which compares societies culturally, finding that people of different races may have cultural affinities and *vice versa*, and that societies and cultures evolve from simple to complex, in direct opposition to the degeneration theory. However, Blumenbach nonetheless believed that any of the races could, through proper exposure, be brought back to their original Caucasian condition, and, despite his racial supremacism, maintained socially egalitarian positions such as abolitionism, endeavouring to have a benevolent attitude to what he understood to be the less fortunate races. While not a modern theory of evolution, Blumenbach would become important because of his use of craniology, providing a materialist method of scientific analysis, and his sorting of the races into five groups—white Caucasian, yellow Mongolian, brown Malayans, black Ethiopians, red American Indians—, much as Carelton Coon would do later on,[466] though slightly differing. Blumenbach had been preceded in a more philosophical attempt by Christoph Meiners, who had been a polygenist—believing the races to have multiple origins—, but also a staunch racial supremacist, organizing humanity into two separate races, a "beautiful" white race and an "ugly" black race.

Polygenism had long existed, since before Giordano Bruno, who saw it hard to imagine a common line of descent between Jews and Ethiopians. Isaac de la Peyrere, an influence on Spinoza, had popularized the pre-Adamite view, and it had become a somewhat common discussion surrounding human origins. Samuel George Morton, however, was perhaps the most influential of the early scientific polygenists, considered to have been the founder of the American School of anthropology or ethnology. He believed that *The Bible* had described conditions in which it was clear that there were others to survive Noah's Flood, who then fell outside of the range of Noah's sons, Japheth, Ham, and Shem, belong to different

---

self to others we are a part of this process. We will find life less depressing when we see "being" as a time-period beyond our own life-term, and "self" beyond our own body.

[465] Sociocultural anthropology would diverge into social and cultural anthropology

[466] Coon is inconsistent in his use of five races, because he sometimes distinguishes between Caucasoid and Mediterranoid as if they are completely different

lines of descent. In particular, he found a strong interest in the peoples of Northeast Africa surrounding Egypt, coming to suggest distinct origins of their own, belonging to a dark-skinned proto-Caucasoid group that I refer to as *Levantoid* because they would come to occupy an important position in the Levant at-large. To him, the "Causasian group had many primordial centers, of which the Egyptians represent one." Morton had a very large collection of human skulls and contributed greatly to the advance of craniometry, believing brain capacity to have a great deal to do with intelligence. He would have many followers. Charles Caldwell was a contemporary of his, a physician who was also an adamant polygenist. Paul Broca was an early French proponent of polygenism and follower of Morton, who focused greatly on hybridization. He believed that the different human races were sourced from different origins, but that they could nonetheless hybridize. Broca had been exposed to hybrids of rabbits and hares that could produce viable offspring, and so to him hybridization did not demonstrate the sameness of species. Instead, he categorized hybrids in one of four ways. They could be completely infertile, infertile except to backcrossing, increasingly infertile with each generation (*paragenesic*), or fertile (*eugenesic*). According to him, then, the current French people were a eugenesic mixture of various Iron Age peoples, primarily Celtic and Germanic. In Broca's use of the term, *race* did not only apply to the differences between people of different continents, but also to the differences between peoples of the same continent, such as Germans and Celts of Europe. Broca opposed slavery and the genocide of the Native Americans, believing that monogenism was being used as a justification for both. While it would become common to criticize polygenism as inherently racially supremacist, this is not necessarily the case, as Broca shows. Many others also saw monogenism as a source of racism that denied the unique origins of non-European peoples and their claims to natural or God-given sovereignty over themselves and their territories. Josiah Nott was not one of them. He was, however, a follower of the earlier polygenists and a practicing physician and anatomist, famous for his inquiries into yellow fever and other maladies, attributing them to *animalcules*, or "molecule-sized animals," and pointed to mosquitoes as a culprit, contributing to the Germ Theory of disease and to the Insect Vector Theory. A slaveholder, and counter to Broca, he unfortunately saw polygenism as an excuse for his slaveholding, believing Africans to live their best lives under the authority of a white master. Nonetheless, he held that each race had been created in its own territory, wherein it had certain advantages. George Gliddon had been an Egyptologist, one among many to argue that the skulls of Ancient Egyptians were characterized by European features and had established themselves as a caste over more Congoid sorts. Ephraim George Squier was an American archaeologist famous for his work with Edwin H. Davis on sites such as the Serpent Mount and other Native American wonders built by the ancient "mound builders." He too believed that the different human races had origins separate from one another. Terry A. Bernhart, in *Ephraim George Squier and the Development of American Anthropology*, writes that

> Squier put forth a softer polygenism [than most], combining Gallatin's (and Humboldt's) position of mankind's psychic unity with the by then dominant scientific belief of separate origins and parallel (if retarded and/or backsliding) sociocultural evolution. That is, Squier argued that the similarities found among cultures – particularly nature worship – did not depend on a common origin. For Squier, separate origins of races did not preclude progress to 'civilization,' though 'degeneration' was a constant danger, even for the apex of 'civilization,' the northeastern United States.[467]

Louis Agassiz, a famous geologist known especially for his contribution to Glacial Theory, was also a polygenist, as had been Charles Pickering, Charles Caldwell, John Beddoe, James Hunt, Charles White, and John Crawford. Charles White and John Crawfurd, among other polygenists, also opposed slavery.

[467] Berhart

Crawfurd can be said to have been a major influence on the cessation of the East India Tea Company's brutal caste system in its control of India, supporting instead liberalism and equal rights, and this despite his own view that there were natural inequalities between the races. Many polygenists held to what is called the *White Man's Burden*, the belief that it was the obligation of white people to spread civilization to people of color, something that continues today as missionaries from white nations lend assistance to South Americans, sub-Saharan Africans, South and Southeast Asians, Austronesians,[468] and Oceanics.[469] As with *color-blindness*, meaning "not to judge by race," the White Man's Burden is today seen by postmodernists as a sort of "benevolent racism."

Running counter to the ideas of polygenism along with Blumenbach was Georges-Louis Leclerc. They were, together, the major proponents of Degeneration Theory, a theory of evolution coinciding with the process of entropy. They would be followed by the bigshots of science today, such as Thomas Hodgkin, Charles Lyell, Richard Owen, and Charles Darwin, as well as secondary favorites such as Jean Lamarck and Georges Cuvier. This would become the foundation of the "Out of Africa" concept that has come to dominate the institutions.

The heirs of polygenism would, to a diluted extent perhaps, be the polycentrists, such as Franz Weidenreich and Carleton Coon, and, to a slightly lesser extent, the multiregionalists, such as Milford H. Wolpoff and Alan Thorne. Coon, along with his interest in Weidenreich, had generally followed more directly after William Z. Ripley[470] in his physical anthropology. Ripley, who, like Georges Vacher de Lapouge,[471] saw the European races coming in three major forms,[472] had been opposed by Joseph Deniken, who preferred to break the races of Europe into six primary and four secondary races, which would later be considered to be a transition toward ethnology and the study of *ethnicities*, or groups related by self-identity.

Physical anthropology is an incredibly sensitive issue for many people and has been looked down upon by forces of political correctness associated with *postmodernity*, the time after the World Wars. This has especially been the case since the influence of physical anthropologist such a Madison Grant— the political progressive and Nordicist racist— on politics, by way of people such as Adolph Hitler, who had said of Grant's book that it was his *Bible*. Physical anthropology would nonetheless persist through people such as Jan Czekanowski and Carleton Coon. Since UNESCO's statement and attack on Coon, however, physical anthropology has been compromised by political correctness and institutional favoritism toward cultural anthropology. These sorts of historical factors, which distort public understanding, should be considered if one is going to engage in sound science!

Race is sometimes used interchangeably with *color*. It is common, for instance, to speak in terms of *white* and *black* or even including *red*, *brown*, and *yellow* races. This is not entirely incorrect, especially if one takes to a multiregional, hybridizing view of "race," wherein race is not something that must arise from common origins, so much as being a *genre* or *grouping* of people, many of whom do not share more specific phenotype characteristics or geneaologies, but merely a similar history of facing the same ecological pressures and shared goals of survival and enjoyment therein. This may be

[468] In this case, the inhabitants of Malaysia, Indonesia, the Philippines, and Madagascar
[469] The inhabitants of *Oceania*, being Australia, Tasmania, New Zealand, New Guinea, Melan-, Micro-, and Polynesian islands out as far as Hawaii to the North and Easter Island to the East
[470] In some respects, Ripley was also a predecessor of Antony Sutton in that he was a strong critic of Wall Street secrecy. He was also a critic of corporate and railway economics, having served himself in government departments and bureaus.
[471] Georges Vacher de Lapouge also posed that race was fairly synonymous with class
[472] Nordic, Alpine, Mediterranean

imperfectly[473] analogous to putting groups of hybridizable birds together according to color and declaring them to be of a kind. Human race— contrary to popular, hierarchical thinking— is not necessarily (though most oftentimes is) tied to shared familial origins.

The widest grouping of races, following after Meiners, would be dualistic, and would be split between "dark," "black," or "colored" people and those who are "light," "white," or "fair." In other words, between pigmented or melanated people and those who are depigmented or albinized. This generally separates people into Northern and Southern populations, as well, or between polar and equatorial populations, as people in Northern or more generally polar conditions tend to be depigmented, while those in Southern or equatorial regions tend to be more melanated. This is not entirely unlike the rest of Nature, as Buckminster Fuller points out, when he tells us that

> Biology demonstrates a botanical counterpart [...] manifest in the Earth's hardwoods. The most Northerly are white oak, Southward of which we come to the pink oak and light-yellow birch. As we go farther South, we see the pink pearl maple and gray ash, then the deep red-yellow Southern pine, South of which occur the brown mahoganies and dark-gray teak, and farther South the dark-brown rosewoods, with the spectrum change terminating at the Equator in the black ebony.[474]

Even within a given continent this tends to be the case. The white race in Europe, for instance, has been divided into the "pure" Mediterranoid (*Homo mediterraneus* or, prior, *meridionalus*) and the derivative Alpinid (*Homo alpinus*) and Nordid (*Homo nordicus* or, prior, *Homo europaeus*) subraces of Indo-Eurafricanoid,[475] with European Mediterranoids of the South often being associated with an olive or golden complexion and dark features, the Alpinids of Central Europe with ruddy skin and medium features, and the Nordid of the North with pale skin and light features, all to varying extents. Of course, extending South in the Mediterranean, the Berber people— a mixture of Mechtoid, Congoid, and Mediterranoid peoples primarily— tend to have an even darker complexion than their Mediterranoid cousins of the North Mediterranean and Levant, being bronze or chestnut; down South of the Sahara, peoples get even darker, with especially dark people such as the Pygmy, Ethiopian, and Chadic people natively near the equator, being mahogany, ebony, and jet black, before things lighten up again, becoming more chocolate. At the tip of South Africa, the fairly light, caramel-skinned Capoids are found.[476]

Among "white" people, or those with "fair" skin today, are the Nordid, Caucasoid (or Alpinid, Turanid, and Armenid), some of the later Mongoloid populations (such as the Han, Manchu, Mandarin, Korean, Japanese, etc.), and to a lesser extent olive-skinned Mediterranoid and even, by some indexes, Capoid. However, Australoids, Congoids, many Mongoloid populations, Mediterranoid peoples, and usually Capoid peoples are generally considered to be "black," "colored," or "dark."[477] Of course, the range of skin colors and tones in this dualistic approach to race is quite wide. Among the lighter skin tones may

---

[473] Because *Homo* is a genus or species, and not a class, the way *bird* is

[474] Fuller, 10

[475] Probably better stated *Homo sapiens mediterraneus*, *Homo sapiens alpinus*, and *Homo sapiens nordicus* to be clear we are speaking now of a singular, even if hybridized or composite, species

[476] During warmer and wetter periods, though, when the Sahara was green, Coon suggests that these people lived in North Africa, having been displaced by Bantu peoples, migrating along the hills to South Africa. Interesting to note, also, is the fact that these South Africans have an epicanthic fold that might be held in common with Mongoloids, whom Quigley holds to be derived from Turanids who had followed the Altai Mountains into Asia and North America.

[477] Capoids can be placed into either category because of their simultaneous Southern and polar tendency, as they are found today especially in South Africa. Mongoloids span both categories because populations especially near the equator, such as the Khmer in Cambodia, can be especially dark. Some Siberian populations are also, counter-intuitively, fairly dark (but lactose tolerant and often seafood eaters).

be included, depending on the index used, pale skin, ruddy skin, olive skin, tan skin, and even yellow or brown skin at times. The darker skins include ebonies, mahoganies, chocolates, and browns of all kinds, and sometimes also reds (Amerindian) and even caramels and yellows (Mongoloids). In layman's terms, *white people* might usually and generally include both European and light-skinned Asian people, and *black people* include Africans of all kinds, Dravidians, other dark-skinned Asians, and Australian aborigines. This is not a comprehensive or specialized list, of course.[478] Sometimes, *white people* is used exclusively for Nordid people, other times for Nordid and Caucasoid (or Alpinid and Turanid people), and other times also including olive or tan-skinned Mediterranoids. *Black people* might be used, in the colloquial, with African blacks in mind, especially in places like the United States of America.

While skin, eye, and hair colors are interesting ways to distinguish people one from another, there have also been attempts to categorize people according to other criteria, such as nose form, eye socket shape, hair texture, or etc. Alfred Cort Haddon, in *The Races of Man and Their Geographic Distribution*, divided race especially by hair texture. He said the *Ulotrichi* were those who had frizzly or kinky hair, which he calls "*woolly*," in which he included groups known to others as *Capoids*, *Congoids*, *Negritos*, *Semang*, and *Australo-Melanesians*. "Wavy" hair, he says, includes undulating, curved, curled, or spiraled hair, the holders of which he deems "*Cymotrichi*," including proto-Malays such as the Sakai,[479] Indonesians and Polynesians, Australoids, Ethiopians, and Indo-Eurafricanoids. The *Leiotrichi* are those with "lank" hair that is straight and falls downward, in which he places the Mongoloids, paleo-Amerindians, and Amerinidians.[480] Nonetheless, the most prominent indicator used by physical anthropologists today is craniometry, which is typically distinguished between *dolichocephaly*, *mesocephaly*, and *brachycephaly*, or "long-," "medium-," and "wide-headedness." The other traits, such as hair texture and color, nasal form, skin tone, eye color and socket type, are still still used to classify the races, but the crania is the most crucial (and also typically the best-preserved). Other features, such as "high-headedness," or *hypsicrania*, and "flat" or "low-headedness," or *playcephaly*, are also considered, as well as a myriad of facial descriptors.

Perhaps the first *Homo sapiens* of which we are aware— *Homo sapiens idaltu*, or *Herto Man*, discovered by Tim White— might be called *Idaltoids* or *Omoids*—in relation to the Omo specimens discovered by a team—, and come from Ethiopia. But these early specimens are arguably as "archaic" as are *Homo heidelbergensis* of the same time. For this reason, they may better fall into a category with late *Homo erectoids*, such as *Homo heidelbergensis*, which have been close to being deemed *Homo sapiens* themselves but have not yet made the cut. These early Omoids would likely have been involved in an Out of Africa event into the Levant, but possibly not far beyond. They would mature into *Homo sapiens* variants, sometimes called *Omoid* but usually called *Ethiopid*. Examples of peoples who have Omoid influence include the Aari, Hamar, Banna, and others of the area. They have strong relation to the Levantoids who may have speciated from them. *Levantoids*, sometimes called the *Littoral* race,[481] were a dark-skinned, kinky- or wirey-haired group of individuals, perhaps derived in part from Omoids,[482] who had speciated toward a proto-Eurasian phenotype. *Levantoid,* unlike many taxa, does

---

[478] Some of the occultists, for instance, hold that there were prior races, including a "blue race" that Lapps—such as the Sami—and perhaps other Finno-Ugric peoples are a remnant of

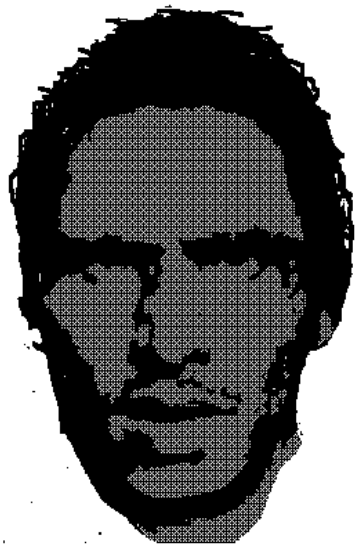
[479] The Sakai of Sumatra are a proto-Malaysian and Negrito people, perhaps from the *Minangkabau*, a proto- or fully Malaysian people, as some of them claim. The Minangkabau use a black, red, and yellow flag (similar to Germany) and speak and Austronesian or Malaysian tongue.

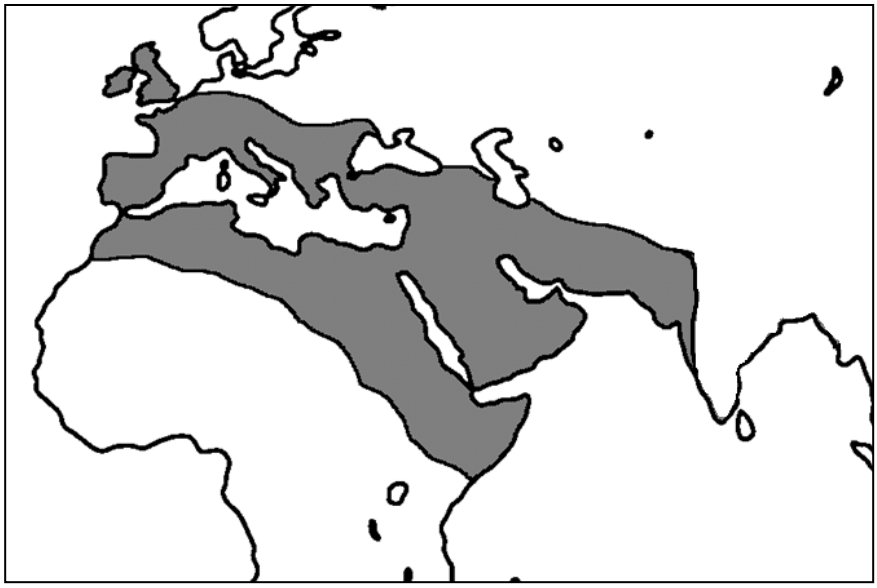
[480] However, it appears to me that many Native Americans have *Cymotrichi* hair, for instance Chief Joseph of the Nez Perce and Ishi of the Yana, both of which seem to have lighter, wavier hair than a Mongoloid typically does

[481] Perhaps especially when seen as a mixture between Mechtoids and Armenoids, perhaps a later rendition of the Levantoid, or early Mediterranoids, attributed with the Neolithic

[482] Omoids being native to the area

not necessarily represent a place of origin,[483] but, in common with Australoid, is named for its area of influence. Coon seems to have classified Levantoids among the Caucasoids, along with some of the surrounding East African populations, though he would classify them as *Negroid*, for him representing the condition of being black and so not necessarily referring to a Congoid phenotype. The most pure Levantoids might be found among people such as the Mehri, though they too are often mixed with Arabids, Ethiopids, Horn Africans, or Arabian Veddids.

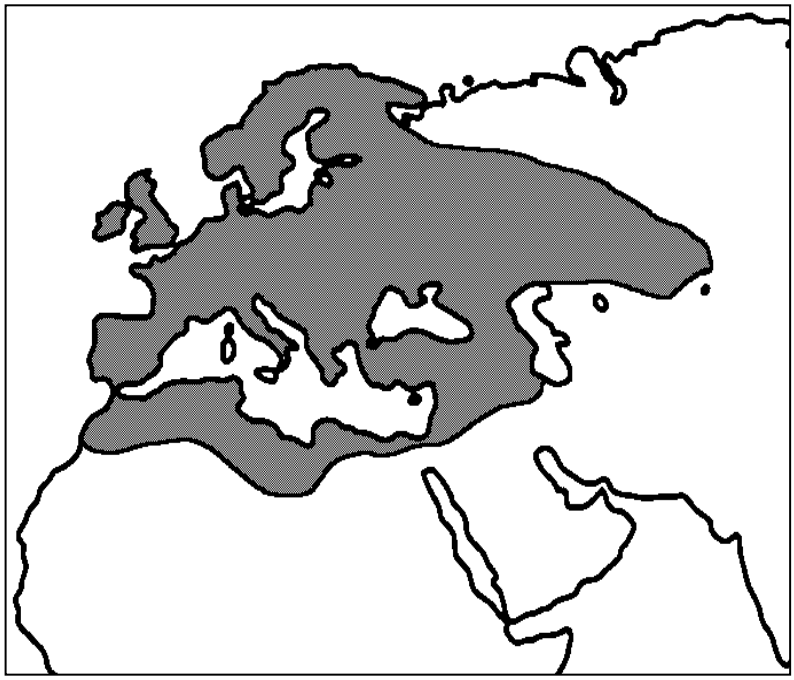


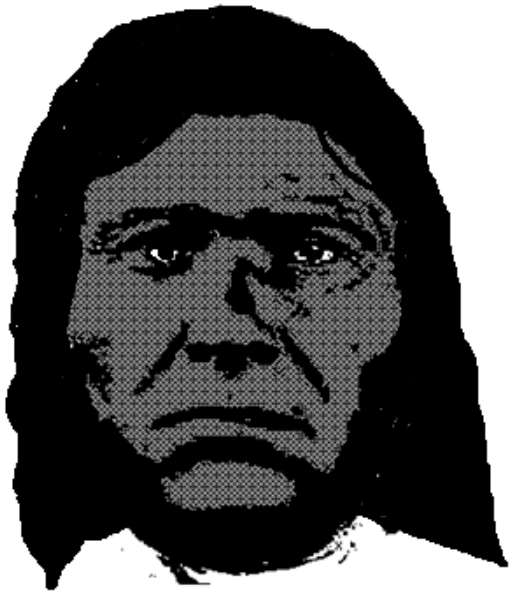


The extent to which these people contributed to the current genome of modern humans is not known, but it is likely a significant substrate, similar to Neanderthal and Denisovan, if not much greater. Among Nilotic, Horn, and Ethiopic Africans, the Omoid influence is likely very high if not foundational, and may have been passed around the continent. Also, early populations coming from out of Africa and into the Levant would have at least passed nearby these Omoid genetics. The Skhul Cave remains and Jebel Qafzeh remains, both in the Levant, are said by some though not others to be modern human remains, and Kebara Cave and Amud Cave have those of Neanderthals. Both Neanderthal and Omoids inhabited the same area there (like *erectus* before them), and even interbred, creating hybrids, perhaps Levantoids or proto-Caucasoids as these genetics may have stuck around there.[484] In this area the Mousterian physical culture was practiced by both Neanderthal and by *Homo sapiens*, who would take the otherwise predominantly Neanderthal culture and put it to use in North Africa and West Eurasia. The human remains in Kostenki suggest that proto-Caucasoids from the Levant had arrived in Siberia, probably following wooly mammoth populations, or that, perhaps less likely, *sapiogenesis*—the transition from archaic humans to *Homo sapiens*— was taking place there as well, perhaps from retreating *Homo heidelbergensis*. Levantoids may have composed some of the earliest actual *Homo sapiens sapiens* of Egypt, Canaan, and the Caucasus. It is likely that Cushites were originally Levantoid or Omoid, and that Levantoids are responsible for the development of the Emiran tool industry, and may have been a leading force in the Levantine Aurignacian that developed toward the Kebaran culture.

[483] Though, it can and does if the widest definition of *Levant* is in use, which includes the area of the Ancient Egyptians, including Cushites

[484] Or possibly but less likely as proto-Australoids, who may have migrated from the area as Omoid-Neanderthal hybrids





In Western Eurafrica, *heidelbergensis* and kin had contributed a great deal toward Neanderthal and would do the same with *Cro-Magnon*, one of the wings of Caucasoid or Indo-Eurafricanoid man.[485] If not first natively in Europe from *Homo heidelbergensis*, perhaps Cro-Magnoid had evolved from what are called *Early Modern Humans* from such places as Israel, such as with the Qafzeh or Skhul remains, themselves derivative of *Homo heidelbergensis* (or perhaps even Neanderthal). These individuals were exceptionally tall, with males averaging just over six feet. Perhaps less politically correct, Cro-Magnoid may be traced back to Galley Hill Man or Swanscombe Man, who, in *The Races of Europe*, Carelton Coon said were mostly likely early examples of *Homo sapiens* in Europe possibly ancestral to contemporary Europeans, both of them found in England, Swanscombe Man in Kent and Galley Hill Man in Bedfordshire.[486] In *Man, The Primeval Savage*, Worthington G. Smith tells us that, aside from Neanderthal, which he calls the *Canstadt race*,

> Two other races are accepted as of palaeolithic age by some continental anthropologists; these are the races of Grenelle and Furfooz, and Truchfere. The men of these races either lived at the same time with the Cro-Magnon men or a little later. If, then, the Cro-Magnon men are not accepted as truly palaeolithic, it is impossible to include races of men as palaeolithic who lived with or after them. As, however, these contemporary or later men, who no doubt date from great antiquity, are accepted in some quarters as representatives of a palaeolithic race, and as they are extensively referred to in works on the antiquity of man, it may be well to illustrate the crania.
>
> [...]

[485] Cro-Magnon was likely a relative of Australoid, but contributed a great deal as well to the substrate of European Caucasoids, such that Cro-Magnon might be considered both an independent predecessor of and contributor to the European Caucasian

[486] Coon suggests that these might possibly be traced to *Homo habilis* in East Africa, which he suggests might possibly be an "ancestral white man" due to its lack of prognathism and its "modern [...] shape and size"

> There can be little doubt that these three skulls belong to one sub-round type, the Grenelle. How ever doubtful these later skulls may be as to age, there can be no doubt whatever that the oldest of the series, the Canstadt or Neanderthal and Spy, once belonged to primeval dolichocephalic savages. The Neanderthal skull is dolichocephalic [...] The Cro Magnon skull belongs to a medium class, sometimes named orthocephalic [...] The Grenelle skull is brachycephalic [...] The Furfooz crania vary from brachycephalic [...] to the medium series, as in the example illustrated [...] The Truchre cranium is brachycephalic[...][487]

Some have tended to treat the various subpopulations of Cro-Magnoids as distinct races unto themselves, such as by suggesting that the Furfoozids were early Mediterranoids. For the sake of this work, and similar to how Smith groups them under "one sub-round type, the Grenelle," I will refer to these subraces of non-Neanderthal, European humans, as *Cro-Magnoids*, though this may not be entirely accurate if implying a singular or common origin. However, unlike Coon, I will generally treat Grimaldi Man as being of Capoid origin or admixture, or otherwise as having features derived from Neanderthal, which is in line with Coon's view. Indeed, Coon at times spoke of Cro-Magnon as being a spectrum composed of more-or-less pure, brachycephalic Cro-Magnoids in the West as as being admixed with dolichocephalic Neanderthals toward the South and East in the Skhul or Qafzeh caves types. Neanderthal was seen as a source of dolichocephalization, as Neanderthals are generally dolichocephalic. However, it is also worth mentioning that Antonio Rosas and Markus Bastir have defended the idea that Apidima 1 represents a brachycephalic Neanderthal. Others have claimed it represents early sapienization. After all, people like Weidenreich had argued that *Homo sapiens* developed, in part, from Neanderthal.

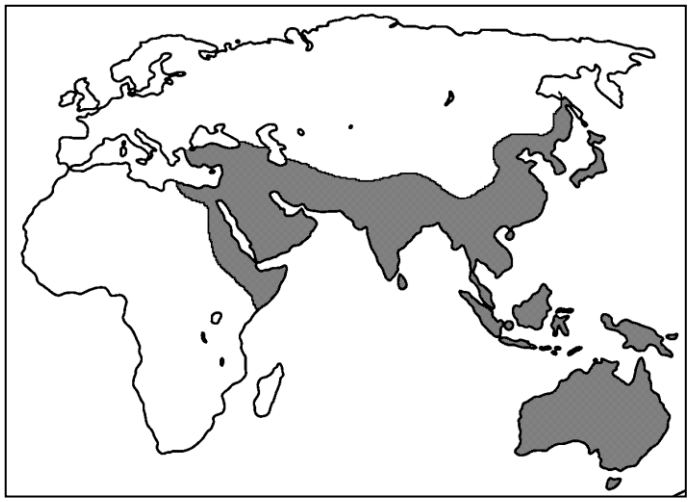
Cro-Magnoids, sometimes called *Early European Modern Humans* (though this may include in it also later Capoids and Australoids, possibly derived separately), were likely responsible for the earliest development in Europe and North Africa away from the Mousterian tool industry of Neanderthal, having developed the Chatelperron and Neronian tool industries in Europe. These would later be complicated by the arrival of Mechtoid (Iberomaurusian), Levantoid (Emiran), and Capoid (Aterian, Bohunician) Aurignacians, Australoid Gravettians, and perhaps even paleo-Amerindian relatives from America that may have been responsible for the development of the incoming Solutrean and Magdalenian tool industries from the West and East, both of which are strangely similar and are associated with use also by Cro-Magnoids.[488] Cro-Magnoids would also intermix with and assimilate the technologies of these new neighbors, as demonstrated by the Cro-Magnoid phenotype of the Combe-Capelle Skull, nonetheless associated with the Capoid Aurignacian culture. Michael Bradley, considering them an early example of the Atlantic race, thinks that Cro-Magnoids may have come from the mythical or legendary Atlantis, which he thinks may be represented by the islands of Azores off the coast of Portugal, part of the submerged Azores Plateu, which he holds to have sunk at the end of the Ice Age[489] (Jurgen Spanuth argued to the contrary that Atlantis was situated on Heligoland, Germany). Plate tectonicists hold that this is a triple junction point between the North American, African, and Eurasian plates, which is used to explain the fracturing, rifting, and faulting found in the area. It is located along the Mid-Atlantic Ridge. The area likely represents a point at which North America, Europe, and Africa once conjoined.[490] Along with the Canary Islands, Cape Verde, and Madeira, it composes a maritime locale known as *Macaronesia*, meaning, in Greek, "islands of the fortunate,"

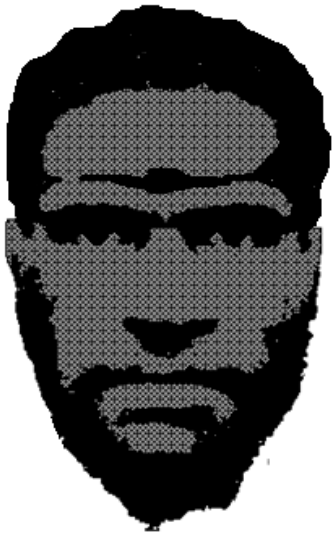
[487] Smith, 34
[488] The Magdalenian skull of Chancelade Man suggests a possible paleo-Eskimoid phenotype
[489] See Bradley[1]
[490] It may have been inhabited by Phoenician or Viking peoples during the Bronze or Iron Age, though likely not for an extended period of time

referring to any islands past the Strait of Gibraltor, which separates Spain from North Africa. *Mechtoids* were a population possibly ancestral to or derivative of Cro-Magnoid,or otherwise mutually related to the Gaunches of the Canary Islands, though there may be reason to question their native origin, as explored later.

Wallace's Line

Australoid[491] includes people such as the Australian aborigine, the New Guineans and others of Melanesia, as well as some inhabitants of Southern Asia (such as Veddoids),[492] and are understood by mainstream paleoanthropologists to represent the next oldest of the existing races. Found especially beyond *Wallace's line*, a line beyond which fauna differs drastically from others, and not entirely unlike the monotremes and marsupials that are also found in Oceania, Australoids tend toward a more archaic phenotype. As such, Australoids, especially Australian aborigines, and Papauans, but also Veddoids of South Asia to a lesser extent, among others, are characterized as very robust, by a prominent brow-ridge, prognathism, thick skulls, platycephaly, large teeth, and large nasal cavities.[493] Aside from this, they are characterized by dark features in their skin, hair, and eyes.





[491] The images of Australoid, Capoid, Mongoloid, Otamid, Ovejerid, and Lappoid are derived from images at humanphenotypes.net

[492] Perhaps the most controversially placed in the group of Australoid are a group called *Negritos*, referring to small black people similar in some respects to Pygmy people, and whose physical appearance tends to look more African than Australian. Negritos may represent an Omoid, Pygmy, or proto-Congoid input into the larger Australoid group, but Carleton S. Coon and others tend to place them in the Australoid category. Nonetheless, there may be a branch of the human family, perhaps among pre-sapiens erectoids, that ties together the Pygmies and the Australoids. It may be that the Negritos are of some relation to *Homo floresiensis* or *luzonensis* and get their small stature and soft Negroid features, uncommon among Australoids, from admixture therewith.

[493] The Capoid and Australoid phenotypes are understood in the mainstream to be among the oldest in the existing modern human lineage. It is interesting to note, however, the disparity in their phenotypes with regard to gracility and robustness, with the Capoid having what might be considered a much more modern phenotype than the Australoid, being very gracile in comparison to the robustness of the Australoid.

Australoid may have developed from Omoid-Neanderthal hybrids or Cro-Magnoids near the Levant, as suggested by many Out-of-Africa enthusiasts; though they more likely developed independently near or in India, or perhaps in Southeast Asia from *Homo heidelergensis*, as might be suggested by the Narmada fossil, a skullcap that may be *heidelbergensis*'s, or as was suggested by Carleton S. Coon.[494, 495] Coon says, "Southern China, Southeast Asia, and those Indonesian Islands which were joined to the continent during the glacial period of low sea level, constitute the homeland of the Australoid subspecies."[496] Most likely, there is some truth to both the Omoid-Neanderthal scenario, coming from out of the Out of Africa folks, and the local Indian or Southeast Asian origins promoted by the multiregionalists. Australoid likely involved a hybridization of local populations with those coming from out of Africa, who were mixed with Neanderthal. The Out of Africa strand in Australoids, or *Austromelanesoids*, may have developed among the mainland inhabitants of Southern Eurasia, before having taken to India, Southeast Asia, and Australia, and then on to Melanesia. Or they may have come from the East. Levantoids and Ethiopids may have mixed with Australoids in the Horn of Africa, a mixture likely contributing to later Elamo-Dravidian peoples also in West and South Asia. Australoid's composing a substrate to the Arabian Peninsula and perhaps even Horn Africa is such that I suspect an indigenous Indian origin, with spreading from there and refuge being taken in maritime Southeast Asia and on out to Oceania. Australoids once inhabited all of Sahul-Sunda, a peninsula that combined Australia, Tasmania, and New Guinea with maritime Southeast Asia. Sea level rising isolated these groups. Australoids may have brought the Gravettian tool industry into Europe, which made use of boomerangs similar to Australian Aborigines today, and largely displaced or assimilated the Levantoid, Mechtoid, and Capoid-driven Aurignacian.

According to Stan Gooch, in *Guardians of the Ancient Wisdom*, Neanderthal man and Cro-Magnon man evolved around the same time, in a polycentric or multiregional and hybridizing fashion, with Neanderthal in Europe and Cro-Magnon in India. These two groups, as he says in *Total Man*, produced two sets of ideologies, which he calls "*System A"* and "*B*." System *A*, associated with Cro-Magnon, was a solar-centered, masculine belief system that might today be related to fascism, while *B*, Neanderthal's way, was a lunar, feminine system that is more related to communism. Gooch suggests that Cro-Magnon came from out of India and into Eurasia and finally the rest of Europe, pushing Neanderthal out.[497] It is well known that Neanderthal's presence was increasingly receding from out of Europe until finally disappearing in Siberia.

Altogether, and details aside, this view seems to be more or less correct. And it is reflected in later patterns as well.[498] The reason for this may be that the equatorial line may have once ran through this treck.[499] This would have been followed, equator or not, by the Handaxe People, such as the Levallois industry, found in the Zagros Mountains, for instance, and all along what is called *Movius's Line*— after Hallam L. Movius, who noticed that handaxes rarely if ever made it into Asia—, and West of that. Along this same line would later develop the *Jat belt*, which is, according to *Jatland* author Laxman Burdak,

---

494 Australoids may include extinct members in their ancestry such as *Homo longi* as well, although *Homo longi* is recently discovered, and perhaps a Denisovan, known to have admixed with Australoids and especially Melanesians (but not Negritos)

495 It's not impossible that there is some prehistory also from South America or Antarctica that has not yet been discovered or revealed

496 Coon[1], 185

497 It is interesting to note that this follows the same trend as later Mediterranoids such as Yamnaya who pushed down into India and Europe as the Indo-Aryans, and then the proto-Nordics such as the Scythians, who pushed down into India as the Indo-Scythians and into Europe as the Belgae.

498 As with the Hebrews before becoming the Iberi (Celts), the Yamnaya and the associated Aryan expansion, and the Scythians and their presence in India before contributing to the Nordic race

499 True North is presently moving toward the Britain.

in "Jat Belt," an "area of continuous distribution of Jat population," *Jats* being an economically and politically important people-group prevalent still in Pakistan and India, gone over in more detail later.[500] I consider this Jat Belt to have, at one time, stretched from the Indies to Scandinavia. Some, such as Adler and others, have argued that the stone tools associated together with the Levallois industry arose independently, and so cannot be considered an indicator of expansion.[501] However, the proto-Elamo-Dravidian people may have developed along this belt as a convergence of Cro-Magnoid, Levantoid, and Australoid peoples, later developing into the Elamo-Dravidians, themselves proto-Jats[502] or a Jat substrate.[503]

What Gooch is calling "*Cro-Magnon*" is more than likely sourced from *heidelbergensis* and proto-Australoid or some relative, possibly some relation to Cheddar Man found in Western Europe. Cheddar Man, first modeled as a light-skinned Cro-Magnon and later modified to a dark-skinned, blue-eyed humanoid possibly of another variety, may or may not have been a combination of Cro-Magnon or early Caucasoid and of an ancient Australoid type coming up from out of India, perhaps not entirely unlike a proto-Dravidian. That there was some kind of relationship between Europe and India that may have extended since the times of *Homo erectus* is not entirely unimaginable. There are other, less Australoid variants of Cro-Magnon, however, associated with the original skulls named as such. These populations of true Cro-Mags, if not "the Nephilim," likely represent Canary Islanders (Gaunches) or some sort of relative coming perhaps from Eurafrica or the Levant, a very early variety of Caucasoid or proto-Caucasoid.[504] Cro-Magnoids have been presented in a number of ways that may preclude their being of a single race, though typically tending to be presented as white Europoids or perhaps as dark-skinned Australoids. Cro-Magnoid has been associated with the Vasconic languages, while Australoid has been associated especially with the Papuan and other New Guinean languages, the Australian aboriginal languages, and as providing substrate to Austric languages.

As Gooch's Australoid-like Cro-Magnon pushed across the highlands and into the lowlands of Northern Europe,[505] Neanderthal was probably already feeling pressured to leave by the warming climate, part-willingly following the receding tundra toward Siberia as the new *Homo sapiens* advanced. One author, going by the screenname *aryanencounters*, merges the Theosophic tradition that spoke of five "root races" with modern science. In "The Aryan Race Story"— *Aryan* generally referring to white Indo-Eurafricanoids—, "aryanencounters" suggests a relationship between the Hyperboreans and Cro-Magnoid, saying that Cro-Magnon had descended into Europe from the North,[506] a story lining up with the idea that the *Nephilim*— a race of giants from *The Bible*— resulted from the mixing of angels and

---

[500] Burdak[1]

[501] Indeed, *multiple convergence*—convergence of a common population or culture from multiple centers of convergent evolution— would allow this sort of thing, and it is unlikely that Stone Age people migrated into the territories of others with a high velocity. Rather, a similar recipe would be baked along similar clines, and a common people would emerge as a result of common genetic inputs and environmental pressures. In this way, members of the same race, due to convergence, do not necessarily always have genes in common, though they will be grouped together according to their phenotype. This is similar in conception to *multiple discovery*, whereby similar things are invented in disparate manners, described by Herbert Spencer.

[502] Perhaps first developing into peoples such as the Munda.

[503] Which is to suggest nearly the same thing when it comes to racial geneses established through hybridizing processes

[504] While some Australoid-like traits are present in Cro-Magnoid, Cro-Magnoid is markedly different from Australoid in many respects, with Cro-Magnoids generally being less archaic in form than present-day Australoids, perhaps resulting from more recent genes coming from out of the Fertile Crescent area, possibly including Caucasoid or proto-Caucasoid lineages, but also due to not having crossed Wallace's Line

[505] Perhaps as described by the Hyperborean model, and much as the Yamnaya and the Scythians would do later on as Aryans and Nordics, and indeed putting pressures on Neanderthal to leave

[506] See aryanencounters

humans, sometimes also associated with the mythology of titans and other part-descendents of the gods.[507, 508, 509] Perhaps this involved a Capoid input into the lineage, resulting in proto-Lappoids[510] or proto-Siberians rather than Cro-Magnoid. However, it may be that Lappoids were already separately present in the form of Chancelade Man, who Coon describes as having existed during a cold snap and having features consistent with Lapps, such as wide cheeks and sharp features.

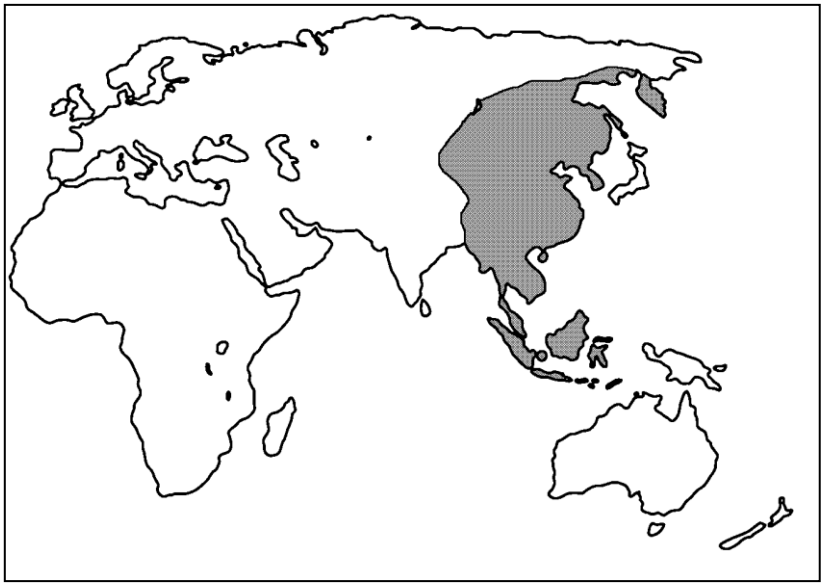
[507] If Cro-Magnon had anything to do with descent from "fairies," similar to the mixture of Australoid and *Homo floresiensis* discussed later, this story is not entirely impossible, nor does it require literal fairies. It might suggest that a mixture of *Homo heidelbergensis* with a humanoid like *Homo floresiensis* established Cro-Magnon as the earliest modern *Homo sapiens* in Europe. To my knowledge, there has been no archaeological discovery to confirm the existence of "wee folk," but the mythology is prevalent enough to consider it anthropologically.

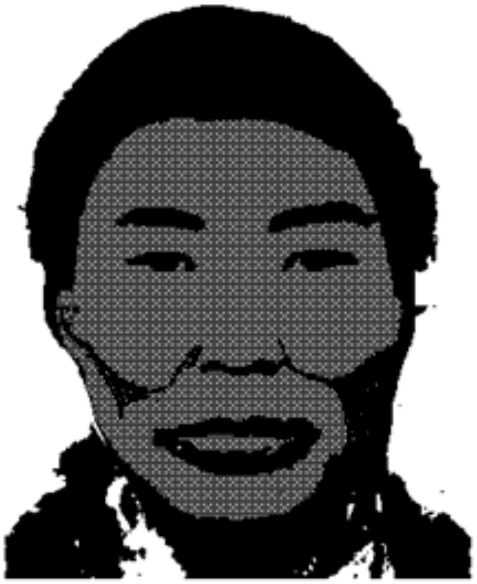
[508] Some elites, aware of their hybrid Titan origins, and obsessed with them, have gone through great lengths to repeat the results of the Nephilim. For instance, a question, "Human-Chimp Hybrids?" is asked of experts on *DNA Files*, by a user named Diane, who states in her question that,

> As you know, in the late 1920s, Soviet researchers (under Il'ya Ivanov, probably the leading expert on artificial insemination of farm animals) conducted fairly extensively and ultimately unsuccessful expiriments in human-ape hybridization.

[509] Side Note: *Anakim* were a Nephilim people in *The Bible*

[510] Discusssed later





Proto-Mongoloids— or early examples of an East Asian phenotype, sometimes styled *South Mongoloids*— would evolve in Asia, as is evidenced by the Liujiang skull, the Red Deer Cave people, and maturing into specimens such as Minatogawa Man.[511] Likely involving some admixture with Australoid, or perhaps having split from a common ancestor, many Australoid traits can be found in specimens such as these. Many of their characteristics are still found prominently in East Asia, especially in the South, and perhaps in their original form they were dark-skinned like one might find among a native Cambodian. Proto-Mongoloid,[512] or *South Mongoloid*[513]— associated with Austric languages and admixture with local Australoid and *Orang Asli*, or primitive and indigenous races—, are perhaps the main racial substrait of East Asia. Maritime Asia, both in the Southeast and along the Eastern coast, would provide a strong substrate of largely-Australoid peoples to the South Mongoloids and coastal North Mongoloids, such as Veddoid, Semang, and Negrito-like peoples, who would contribute a presence within the Ainu people of Japan, the Khmer people and other proto-Malay or Senoid types.[514] Some of these groups, such as the Semang and the Negrito, appear to have semi-Congoid phenotypes distinct from Australoid input.[515] Otherwise, the South Mongoloid is also distinguished by *Sundadonty*, a tooth form particular to *Sundadonts*, the inhabitants of Mainland as well as Maritime Southeast Asia, which may have been brought in from prehistoric Austronesians or Americanoids, who would also round out some of the sharper features of the paleo-Mongoloid.

The *Capoid*, such as the beachgoing *Strandloper*, the *San* bushmen, or the *Khoikhoi* herder, is said by many to be the oldest of the existing human races, though Carleton Coon— who attributed the beginnings of Capoid to Rhodesian Man— suggested it was certainly Caucasoids (Cro-Magnoids). The extent to which Omoid had a role in the development of Capoid is not entirely known, but is certainly a possibility, alongside convergent evolution. The Capoid is at times put into a shared category with other

---

[511] The Liujiang skull might suggest origins for Mongoloid development in Asia independent from Caucasoid, as per the multiregional model, although it does appear to have some Eurostanoid features as well. This is much less so of the Red Deer Cave people, whose features are clearly Mongoloid, marking a clear divergence from the Cro-Magnoids, Australoids, and Levantoids.

[512] Or Indo-Malayid and the Shanid or Senoid or Khmerid types

[513] With some Senids and others being more attributed to Australoid at other times

[514] The various local races of Southeast Asia, who contribute a great deal of substrate to the South Mongoloids, are again known as *Orang Asli*

[515] Australoid is also a strong component among Native Americans

sub-Saharan Africans, here described as *Congoid* peoples. But they have traits that distinguish them from other peoples of Africa, such as the Pygmies and Negroids (together in the Congoid clade), though Pygmies and Negroids such as the Hadza are considered to be especially related to them. Capoid people, with peppercorn hair and caramel skin, slightly less tolerant of the heat, may have evolved as much in North as in South Africa where they are found today, during a time when the Sahara was a savannah rangeland. They are also characterized by long-headedness, a sometimes-occuring occipital bun, a fairly common flat face without prognathism (though some certainly have it), having a high frequency of *steatopygia*, the presence of a large buttocks and upper thigh, as might also be seen in a Venus figurine, suggesting their having had a strong influence in Old Europe, where Venus figurines featured prominently. The presence of Venus figurines, showing *steatopygia*—an enlarged thigh and buttocks—, suggests that Capoids had been fairly widespread, perhaps having been partly responsible, perhaps by way of the Bohunician industry, for the Aurignacian tool industry that replaced the Chatelperronian industry of Cro-Magnoid, later replaced by the Australoid Gravettian and the paleo-Siberian Magdalenian industries. There is evidence, as with the remains of Grimaldi Man and Mal'ta Boy,[516] suggesting that Capoid, proto-Capoid, or a related bunch—perhaps proto-Negroids of some variety—had made it well out of Africa to become major contributors to Eastern Hunter-Gatherers and Ancient North Eurasians, and likely also to Mongoloid Asians. According to Carleton Coon in *Orgin of Races*, however, who rejected the idea of Grimaldi man having African origins,

> A favorite cliche of anthropology, as widespread as the image of the brutal Neanderthals, is that Upper Paleolithic Europeans belonged to three races: the Cro-Magnon, which was Caucasoid; the Negroid Grimaldis; and the Eskimoid race of Chancelade. This concept is a product of the type-specimen procedure. There was, in fact, only one Upper Paleolithic European race. It was Caucasoid and it inhabits Europe today.[517]

Indeed, he affirmed that "the Grimaldi child was no more Negroid than the Palestinians of Skhul and many living Europeans of the Mediterranean."[518] I find this a little curious, however, since— while Coon is skeptical of prognathism being an innate characteristic of Capoids— he also states that the "the Caucasoids who came with" the Paleartctic faunal invasion into North Africa "drove out the Capoids, who crossed the Sahara [...] southward to their present home,"[519] and that if "a skull now and then turns up among them which looks Negroid, Australoid, Capoid, or even Mongoloid, we should not be surprised because owing to the spatial position of the Caucasoids, in the middle of the Old World land masses, they should have been the least 'pure' of all human subspecies,"[520] indicating that he accepted a Capoid presence in Europe (though he described the Venus figurines as obese women, rather than Capoid women with *steatopygia*). I had thought that a lack of shovel-shaped incisors in the literature would indicate that the teeth were not Capoid, but it similarly indicates that they may not have been Neanderthal, as many Neanderthals are understood to have had shovel-shaped incisors. So this lends argument to Coon's view that Grimaldi was Cro-Magnoid ("Caucasoid"), but without telling us for certain the source of admixture. Coon says Grimaldi was Cro-Magnoid, but as he himself states, most understood Grimaldi to have been "Negroid." Regardless of their presence in Europe, when the Mediterranean people pushed Southward, suggests Coon, they likely pushed the Capoid people of Africa into their present location. However, the Capoid's home, the savannah, was also receding around the same time, likely playing an even larger role overall. Coon says that

---

[516] Mal'ta people are associated with Venus figurines too

[518] Coon[1], 584
[519] Coon[1], 590
[520] Coon[1], 486

> there is fair evidence that the ancestors of the Bushmen were full-sized people and that they evolved in North Africa, North of the Saharan barrier which gave them the isolation they needed to become a separate subspecies. When the present Palearctic fauna invaded North Africa near the end of the Pleistocene, the Caucasoids who came with it drove out the Capoids, who crossed the Sahara via the central Saharan Tibesti highlands, and then followed the cool East African highlands Southward to their present home.
>
> There they entered an underpopulated area inhabited by human beings of a lower evolutionary grade, who were related to the ancestors of the Negroes and Pygmies living farther North and West. These aborigines gave the ancestors of the Bushmen little trouble, and were absorbed by the invaders. [521]

The Khoikhoi, well after the European Stone Age, would move into South Africa from Central and East Africa, bringing Neanderthal and Eurasian genetics into Africa, where they came across their relatives the San people, who had been occupying the area for much longer. Khoikhoi have more Caucasoidal features than do the San, perhaps also being of some relation to the Ethiopians, who many anthropologists have considered to be Caucasoids, along with other— perhaps Omoid-derived— Nilotic and Horn Africans, as well as some Sudanese or Chadic people, owing largely to their lack of prognathism and more aquiline noses. The San, on the other hand, have more Mongoloidal features. At times, San may have a pronounced prognathism reminiscent of *Homo erectus*, while most of the time they have gracile and more infantile features (neotony) than do similarly ancient people such as Australoids, whose phenotypes are marked by large teeth and jaws, pronounced prognathism, large nasal cavities, and large brow ridges. Strangely, the Capoid exhibits some ultramodern features in comparison to their fellow Africans, including gracility. There are, however, some more archaic features in them as well, including the tendency to show signs of aging very early in life— perhaps a result of living as hunter-gatherers for so long and dying early, and so having a need to gain the status of an elder at an earlier age—, a penis that is semi-erect at all times,[522] and large labia, known as the *Hottentot Apron*. *Boskopoids* were a South African population typically associated with the Capoids though differing from them in being macrocephalic, similar to the more brachycephalic Cro-Magnoids.

[521] Coon[1], 590

[522] This is likely an archaic feature from times of greater degrees of sexual dimorphism and polygny, and so greater sexual competition, and may allow for quicker use in times when competition is nearby, similar to other Great Apes, who have a penis bone, or *baculum*, and mate rather quickly

Josiah D. Whitney, after whom the Whitney Glacier on Mount Shasta is named, suggested that human remains from the Eocene were found in California in the Sierra Nevadas, along with tools such as a mortar and pestle. In particular, there was a skull called the *Caladeras Skull*, now deemed to be a hoax, which appeared to be anatomically modern. The skull appears to be Mongoloid or Amerindian-related, having rounded eyesockets and pronounced cheekbones similar to the Red Deer Cave Skull. It was considered a hoax for a number of reasons. Miners were said to have placed it purposefully for sake of trickery. Despite flora and fauna around the remains having had been dated to a similar time, and William Henry Holmes's had accepted them as legitimate, Holmes suggested the skull simply did not match the expected timeline, being too modern. Frederic Ward Putnam believed the skull to be legitimate, as did Theosophists, but the mainstream has rejected the skull following Holmes.[523] The Santa Elina Rock Shelter, in Brazil, demonstrates human occupation from the Middle Stone Age as well as containing bones from a ground sloth species, *Glossotherium*. Ciprian F. Ardelean, et al. write, in "Evidence of Human Occupation in Mexico Around the Last Glacial Maximum," that there is evidence from Chiquihuite Cave that humans have been in Mexico since well before the last Ice Age.[524] Even while using the common Out-of-Africa chronology, in *The Essence of Anthropology*, by William Haviland, Harald Prins, Dana Walrath, and Bunny McBride, the authors state clearly a relationship between the Mesolithic and Archaic (paleo-Americanoid) technologies, telling us that in "Europe, Asia, and Africa, anthropologists call [the] transitional period between the Paleolithic and the Neolithic the *Mesolithic*, or 'Middle Stone Age.' In the Americas, comparable cultures are referred to as *Archaic* cultures."[525] Of course, mainstream anthropologists believe that the paleo-Americans had come from either the Bering Strait or, if they are edgy, Austromelanesia. But there is good reason to believe that this is unnecessary, owing both to convergent evolution among primates during times of geographic divergence as well as convergent geography during times of possible planetary contraction that would allow for hybridization. Terje Dahl points out that *The Victoria Advocate* noted long ago that "[f]inds made through excavations in Texas are beginning to give weight to the idea to the theory that man lived in Texas 40,000 to 45,000 years ago,"[526] about the same time as Cro-Magnoid's presence in Europe and

[523] Whitney would find opposition later with another claim— that the Yosemite Valley had been caused by sinking— by John Muir, who suggested it was caused by glaciations.
[524] Ardelean, *et al.*
[525] Haviland, *et al.*, 100
[526] See Dahl[1] (The issue is from August 22, 1974, linked)

Australoid's in Australia. The Meadowcroft Rock Shelter in Ohio is from around the time of Cro-Magnoids and has been associated with pre-Clovis artifacts, Clovis culture having developed later, closer to Texas, spreading from there. George Carter suggested very ancient dates for sites from San Diego and the Calico Mountains in California, going from 150-200,000 years ago. Even Louis Leakey apparently conceded that the Calico Mountains provided evidence of a very early presence for *Homo sapiens* in California. Leakey, working at the Calico Site himself, opposed Hrdlicka's idea that humans had only been in the Americas for some few thousand years, for which Hrdlicka had accused Leakey of teaching heresy. Other sites include Rio Puerco Canyon in New Mexico where butchered mammoths were found,[527] Savannah, Georgia, where tools were found,[528] and in Jalisco, Mexico where there was a possible *Homo erectus* brow ridge discovered.[529] It's seeming that *Homo sapiens* may have pioneered the place much sooner, or even evolved there natively, perhaps, like other Hominids, by way of a hybridization of vastly different specimens. Carlos Prince argued that the American Indians' ancestors may have existed in the Americas since the early Stone Age, and seems to have supported a kind of polygenism.

George K. Neumann, who proposed several kinds of phenotypes among the *Americanoids*—people of America—, suggested that the earliest inhabitants of the Americas had been a race he referred to as *Otamids*. This race, his most significant contribution, seems to have appeared first along the coasts of Texas and California, and spread from there to establish the earliest phases of the Lithic Period in American history, to later be joined by migrants from elsewhere. Neumann proposed that the Otamid had originally come from China, by way of Polynesia. At his time, this would have implied an origin from *Sinanthropus*, or Asian *Homo erectus*. The Channel Islands in California show the earliest widely-accepted human presence in North America.[530] He considered Otamid presence to be found prominently in the American Southwest, Illinois, and the Atlantic Coast. Other Amerindians are a sort of derivative or crossbreed of this sort, Neumann suggests. "The National Survey of Historic Sites and Buildings," by Conrad L. Wirth, holds that

> Only one partial human skeleton has been found which has been generally accepted as representing a very early inhabitant of the area now comprising the United States. This is the individual which, although a female, has become known as Midland Man. We know that the skull was extremely long in relation to its breadth and that the teeth were badly worn; that is about all. With so fragmentary a specimen it is difficult to assign it to any particular physical variety; but according to Stewart, some details suggest correlations with the Otamid variety as defined by Neumann. This variety is believed to be one of the earliest in America, and one which originally had a very wide distribution but was later forced into refuge areas. Virtually nothing is known of the physical anthropology of early Siberian peoples, but the Otamid skulls do resemble the late Paleolithic skulls from the Upper Cave at Choukoutien in China.

[527] Dated to around 37,000 years ago
[528] Dating back to 50,000 years ago
[529] Dated to around 50,000 years ago
[530] The area is presently occupied by Chumash and Tongva (possible relatives of Tongans) who use *tomol* or *te'aat* seafaring boats, being very economically influential through trading networks. Chumash canoes, or *tomols*, of Coastal California are distinct from others in North America, but similar to those in Polynesia such as in Hawaii.

> More skeletal remains have been obtained in Archaic Stage sites in the eastern United States.[531]

Mario Pichardo associates a group he calls "*Homo sapiens Americanus*" with skulls that are also identified as *Otamid*. Interestingly, he says that the most "primitive morphology is the Lagoa Santa, small thick boned in Brazil," but that he now rejects an earlier assertion he made that "some limb bones of a giant ateline (monkey) from Lagoa Santa might be referred to as the same hypodigm,"[532, 533] due to the later discovery of skulls that were certainly *Homo sapiens*. Could his retraction be mistaken, or is he making an accidental connection for us to *Protopithecus* and the paleo-burrows of Brazil, both also discovered in Lagoa Santa? It seems that at least one human species must have evolved natively in Brazil from *Protopithecus*, who is responsible for the paleo-burrows, and that Pichardo may one day retract his retraction. Likely others are derived locally from the Americas as well. Mario Pichardo suggests that Otamid-related skeletons have been found from Ice Age Eurasia, in Siberia and Europe, as well. Some of the Otamid skulls[534] seem to have some degree of prognathism resembling that of a Neanderthal, but otherwise have an exceptionally flat and slanted face, a sloped head (even in absence of archaic platycephaly), and other features such as an occipital bun with an occasional *Inca Bone*, a point on the back.[535] Otamids had long limbs and probably had aquiline or hooked Roman noses, deep red skin,[536] and may have had blonde or red hair. Their jaws show that they were highly carnivorous, and they are found to have at least sometimes had double rows of teeth. Sometimes the Otamids are associated with gigantism. Because not all of the Otamids are giants, however, it is suspected that they may have been hybridized with a much larger human, perhaps more ancient. *The San Antonio Express*, for instance, a reputable newspaper still around today relayed to us by Terje Dahl in "Texas giant-sized skull: Now confirmed by the university records," had a report of a very large human skull found by W. Duffen, alongside others of normal size, in a burial mound, the Morhiss Mound. These skulls were

[531] Wirth

[532] A *hypodigm* refers to a sample from which the characteristics of a population can be inferred

[533] Pichardo

[534] While Georg Neumann was fairly respected, Joseph K. Long, in "A Test of Multiple-Discriminant Analysis as a Means of Determining Evolutionary Changes and Intergroup Relationships in Physical Anthropology," denies the existence of an Otamid type altogether (See Long[1]). Others however, such as Sharon Day, believe skulls such as the Lovelock Cave Skull to be Otamid (see Day[1]). Still more have argued that the Ophir Skull, which has been described as having a jaw incapable of grinding and only useful for eating meat, or even the Foard County Skull, are Otamid or partially Otamid, as well as Arlington Springs Man (Arlington Springs Man was thought to be a man, and then a woman, before shifting back to its being a man). George Neumann himself pointed to skulls such as the Browns Valley, Wyoming I, Tierra Del Fuego, Astahuacan 2, Midland, and El Penon 3 skulls. "The Union Lake Skull, a Possible Early Indian Find in Michigan," by Meredith Black and Charles E. Eyman, suggests the *Otamid* classification for the Union Lake Skull found in the Humbolt Sink (see Black and Eyman). Sharon Day points out double rows of teeth, or *ectopic eruption*, on the Humbolt Skull. The Union Lake Skull is long-headed, narrow-faced, prognathic, has brown ridges, and an occipital bun, but does not have large nasal cavities or other features of an Australoid. The skull appears *Homo sapiens* but with Neanderthaloid features, particularly in the cranial form.

[535] Inca Bone separation from occipital bone, as is seen in some Otamid skulls, is something occuring in common with rodents, rabbits, and even-toed ungulates. Zaria Gorvett, in "How modern life is transforming the human skeleton," writes of the Inca Bones on skulls found throughout the world, pointing to their existence also in Micronesia, on the Island of Guam. She suggests a Lamarckian origin for these bones, which she suggests have been increasing in recent years. She thinks it is from tension on the neck from the use of new technologies. However, the Guam islanders didn't have cell phones. And they happened to be giants. She attributes the Inca Bones on their skulls, and their gigantism, to having repeatedly lifted heavy weight. This established a robust form and an Inca Bone, she says, because the robustness was needed to deal with the weight, and because the head would be tilted when carrying items on poles (see Gorvett). Whether this turns out to be true or not, it does speak to an academic admission to giants with Inca Bones, and to Lamarckian evolution as the cause. And that in itself represents some degree of progress, or at least a need to co-opt explanations that might otherwise threaten the powers that be.

[536] Like a *Margid*, a Native American phenotype, described later

analyzed by Marcus Goldstein. It was said to be twice the size of a normal human skull. Terje Dahl relays a report from Goldstein that the individual was very robust but not particularly tall.[537] People with a high relation to the Otamids include a great deal of Native Americans, among them especially mentioned in this text the Yana, the Navajo, the Yamana, and many of the Meso-Americans,[538] though all of these have their own, more specific classifications as well, with Otamid being merely an element of these groups. Some have argued that the Otamids were not alone in the Americas, suggesting that the ancestors of the later Americanoids[539] also had a presence in the Americas among the Paleo-Amerindians, perhaps originally distinct from the Otamids. The Otamid skulls are the oldest and most nativistic of the skulls in the Americas, while the others are mixed with two later migrations of people from Siberia, Neumann suggests.[540] Among the earlier migrants to join the Otamids in the Americas, suggests Neumann, were other paleo-Amerindians. However, there may be an Otamid presence also in New Guinea, the details of which appear to be intentionally esoteric.[541] Otamids have been called with others *Otamid-Sundadonts* (as in, from Sundaland).

---

[537] See Dahl[1]

[538] Worth noting also is the Pericu Indians of the Southern end of the Baja California Peninsula, who have been considered especially related to the original settlers of the area

[539] Ashiwids, Iswanids, or Walcolids of North America, and the Centralids, Brazilids, and Andids of South America, discussed later

[540] Others have proposed admixture also from Melanesians

[541] ChatGPT, the new "artificial intelligence" (AI) "chatbot" program, role-playing as Anarchist Information, so as to have anarchist values of free thought (When ChatGPT is put into a role with clear parameters it is more loose with the information it provides, at least for the time being), suggests that Georg Neumann and other anthropologists, including Marilyn Strathern, Eric Kline Silverman, and Tim Walsh, have written about the presence of an Otamid culture in Papua New Guinea, Neumann in "The World of Otamid: An Interpretation of the Way of Life of a New Guinea Tribe," Strathern in "The Otamid and Their Social World" (purportedly from *Property, Substance, & Effect*), Silverman in "George Neumann and the Otamid: Reflections on Filedwork and Theory," and Walsh in "Ritual and Power in the Otamid of Papua New Guinea." GPT has described the Otamid of New Guinea in contradictory ways, suggesting that they are both non-hierarchical and hierarchical, and that they have a society based on reciprocity and mutual aid that makes decisions by consensus. Owing to the literature on Otamid in general being well-hidden, it seems, I've had to largely resort to third-party sources on Neumann, some of them belonging to Bigfoot enthusiasts, from whom I have actually learned some important things nonetheless. Even the literature on the Otamids of North America has been stashed away so as not to be seen by the riff raff, like myself. The above texts, if they exist, cannot currently be found. Owing to ChatGPT's self-contradiction, as well as some lies or diversions told in the past, as well as its being in anarchist role-play mode, it is difficult to assess whether ChatGPT is creating a diversion, is appeasing, or if there is in fact a mutualistic tribe of Melanesians called *Otamids* written of by the same anthropologist who established the Otamid phenotype in physical anthropology. If this is indeed the case, and the literature on Otamids in New Guinea and much of it in the Americas is indeed hidden away, finding this literature might serve to quell the need for speculation. As it is, with it being a known unknown, speculation is about all that can be done. It seems likely that Otamids are composed of a mixture of Melanesian Australoid and Denisovan genetics in the Americas and, if this is true, we might expect the same from Otamids in New Guinea.

Carlos Ameghino, however, had identified a race that I call the *Ovejerid*.[542] Ovejerid may have been an early occupant of the Americas alongside Otamid, and, despite what Neumann says, probably before. This race seems to have radiated from Southern North America, Central America, and Northern South America, though its origins may be in South America.[543] Ameghino had referred to a population discovered in Argentina as *Homo pampaeus*.[544] He believed that *Homo sapiens* had come from Pampas, the South American lowlands. He believed he could show a series of development in succeeding generations among his skulls. He also believed there to be two different races present, an *Ovejerid*[545] that was smaller, later found to practice head flattening,[546] and another that was much larger, likely related to what would later be classified by Neumann as the *Otamid*. The term *Ovejerid* will be used in a very loose sense, even moreso than Neumann's *Otamid* category, which has been criticized for his relying on qualitative sorting rather than pure quantitative measurement (but which has not been superseded by anything better). Like Neumann's *Otamid* classification, this is not a strict category, but essentially means "other than Otamid," because we know such a thing is likely to have existed, though we cannot be sure the morphology due to so few specimens and scholarship that is made public. *Ovejerid*, for our purposes, refers to any paleo-Amerindian population that is not itself strongly Otamid-related or derived from migtrations of Cro-Magnoid, and may actually include a number of populations that need to be better delineated. Due to the copper tone that is common throughout the Americas, I imagine that the Ovejerids were themselves a copper brown color not entirely different from what might be found among Lagid populations surrounding Lagoa Santa or among Polynesids and Indonesids, though perhaps darker at this time. The migrations from Asia would probably tend to mix with the reds and browns to create the more familiar copper tones associated with Americanoids today. It is assumed herein that Ovejerids were an indigenously-evolved population, or perhaps multiple populations that were hybridizing and would split from time to time as well, and that this may also be the case for the Otamid (though Neumann suggests an arrival by watercraft, which seems plausible).

[542] And which may be associated with the Texepan Walcolid, and probably elements in Ashiwids and possibly Iswanids, as well as Centralids, Amazonids, Andids, and etc.

[543] Perhaps in part due to the establishment of trade embargos in Panama or nearby restricting flow, similarly to the effects of the Silk Road in Eurasia, perhaps being connected itself with an early maritime trade route, giving rise eventually to empires such as the Mayan and Aztec

[544] This population has been dated by some to 300,000 years ago

[545] He called it "*Ovejero*"

[546] Perhaps a relative of the Walcolid

Largest theoretical range of Paleo-Americanoid phenotypes (Otamids and Ovejerids)

A third population, perhaps indigenous to the Americas, possibly related to Denisovan or another Hominid like *Gigantopithecus* or *Meganthropus*, and which may have been responsible for the great height of some of the Otamids, is inferred to be possible but is not assumed, and so is treated within the realm of myth or legend, as a *Cryptid*, a species which is known only through hearsay, true or false, eluding public attention. This is here associated with stories about Bigfoot, Sasquatch, Yowie, Yeti, and etc.

There are other possible people-groups in America, beyond this. Windover, Florida had some bog bodies that were said to be of an archaic phenotype, but appear generally Indo-Eurafricanid, perhaps representing an infusion from Neanderthal into some of the incoming Eurasians. Images are hard to find, however. While the men were reportedly short, the skull of at least one showed high-rooted noses, and a reconstruction of a female body was recovered with red hair. Another skull, that has been apparently connected to the Windover people in Florida shows a markedly doliciocephalic craniomorphology that shows two hemispheres in the back and from the top, as in a heart shape, as if having two backs to the head, a true "butt head." This individual seems to fall outside of Neumann's classification system, and some have associated it with Boskopoids. Then, again, the tiny people of Wyoming also cannot be forgotten.

Regarding Otamids, Sharon Day writes, in "Ancient Giants' Migration and Origins," that they "were found along waterways from Vancouver to Catalina Islands, Baja, Nevada Lake Lohantan, Great Lakes, Mississippi, Texas coastal area, tip of Argentina, South Pacific, Australia, Solomon Islands, Indonesia, New Guinea, Canary Islands, but there are also a good deal of them found in locations like Georgia and France."[547] Brian Handwerk, in "Ancient DNA Charts Native Americans' Journey to Asia Thousands of Years Ago," writes that the migrations along Beringia were not one-way, as is commonly taught, but that Native Americans had also migrated into Siberia and, in particular, the Altai Mountains and Lake

[547] Day[2]

Baikal regions,[548] home to the Denisovans and the Tungids.[549] However, this probably began much earlier than Handwerk suggests, probably during a "mammoth steppe" that left behind the Yana people, or "Ancient North Siberians," of the Yana Rhinocerous Horn Site, distinct from the Ancient North Eurasians and the paleo-Siberians (Tungids) that would be derived, in part, from them.[550] The *mammoth steppe hypothesis* says that the mammoths had roamed in interglacials in a range from Canada to Eurasia by way of Beringia and that all of this was basically a steppe roamed by mammoths, reindeer, and perhaps people alike. The *wood-pasture hypothesis* of Frans Vera suggests that a savannah sort of ecosystem maintained by large grazers and browsers would have been the likely scenario following the Ice Age. The Americas and Eurasia were not always so separate from one another, certainly not moreso than Africa and Eurasia. This explains why a Clovis Point-type industry has been indentified at the Yana Site.

The Yana River, where the Rhinoceros Horn Site was discovered, notably contained pit-homes. It is near the Yana Plateu, and is found in an uninhabited region of Sakhaland as part of the Yana-Oymyakon tectonic zone and has many rivers and swamplands. The Yana area is part of the Pole of Cold, the coldest area in the Northern Hemisphere. *Lappoids* are derived in part from the Ancient North Siberians or Yana people of the Yana Rhinocerous Horn Site who may themselves have been paleo-Amerindians, or Americanoids, who had traveled from the Sierra Nevadas, now home of the Yana Indians, into Yakutsk, prior to the Mongoloid settlement of the Americas. Lappoids are named after the Sami, or Lapps. The original home of the Lappoids, however, was probably not in Lapland, their current home, but is likely, according to legend, to have been nearest to the North Pole of the time, which was around Alaska or Siberia, perhaps near Yakutsk, where they would later be known to others, such as the Greeks, as *Hyperboreans*, becoming very wealthy, likely in connection with peoples in the Americas, and well-versed in polar myths. The rest of their genetics are probably derived from Cro-Magnoid, Australoid, Capoid, and Neanderthaloid, representing an early mixture of modern humans. The distinction between Cro-Magnoids, Lappoids, and Ovejerids may ultimately have occurred largely during glaciations that set them apart from one another, otherwise being, aside from admixture with local populations, largely the same stock of (hybridizing) people. Jan Czekanowski, however, and I think correctly, considered Lapps to be a race of their own. Because of their most ancient origins as Southern- and Western-migrating proto-Turanids before the appearance of Turkic phenotypes, his label of *Lappoid* might be fitting in the sort of manner that *Mechtoid* is fitting of the proto-Berber phenotype, existing before Arab invasions. Lappoids, except for the Sami, Kets, Jomon (old Ainu), and similar peoples would be subsumed entirely into later populations of Eurasia, and would also contribute toward North Mongolian and Amerindian phenotypes. They will be gone over later in a little more detail later.

[548] Lake Baikal is also very biodiverse, perhaps reflective of its being a biological convergence zone between Europe, Asia, and the Americas, having also been a possible place of origin for Turkic peoples

[549] See Handwerk

[550] More than likely, such migrations brought with them elements of the Yeniseian, Uralic, Altaic, Caucasian, and Daic languages and, by extension, Indo-European, from out of the Na-Dene family. In this way, the Borean languages came to be affiliated, collectively having Nostratic or Eurasiatic (Kartvellian, Ural-Altaic) and Dene-Daic (Yeniseian, Circassian, Daic) elements to them.

The origins of the most enigmatic aspect of Cro-Magnoid connects it to the *Mediterranoid* race, discussed later, by way of the Solutreans, and to the paleo-Amerindians or Otamids and Ovejerids by way of the Yana.

Donald Alexander Mackenzie had considered Cro-Magnoids to be something of a proto-Mediterranoid people similar to Basques and other Iberians, as well as Berbers. They would be displaced, he suggested, by a later Mediterranoid people he associated with the Solutreans, being followed up by Alpinids and Lappoids and even later waves of Copper Age Mediterranoids. These Solutreans, sometimes loosely associated with the Chancelade or Combe-Capelle skulls, appear to possibly be coming from the Americas, though are typically considered to have gone the other direction. It seems that early explorers of South America, probably Australoids or ancient Polynesians of another sort, had either paddled along the coast of East Asia, across to the coast of Alaska, and downward, or may have made their way into South America by way of an Antarctic route during a warmer climate. Indeed, This was the view of Mendes Correa. As per Juan Comas, in "Antarctica, Siberia, or Across the Pacific… Where Did the First Americans Come From?"

> A. Mendes Correa, of Portugal, advanced the theory that an Australo-Tasmanian human element populated America not by sailing across the Pacific but by marching across Antarctica, island-hopping across the string of archipelagos between Tasmania and Tierra del Fuego at the southern tip of South America!
>
> Mendes Correa has indeed demonstrated that between 15,000 and 6,000 B.C., Antarctica was free of glacial ice and actually had a temperate climate at the time. Obviously, no archaeological proof exists to confirm this Antarctic migration hypothesis, and it will be extremely difficult, not to say impossible, to uncover any evidence with the permanent ice cap now covering all of the Antarctic continent.[551]

On the other side of the continent, however, they may have had something to do with, or have come into contact with, the pre-Clovis or Clovis paleo-Amerindian people, possibly trans-Atlantic travelers from Europe as with the Solutrean hypothesis, but more probably being the population that the Solutreans were ultimately derived from. They may have been Ovejerids with Otamid influence.

Despite the Yana of Yakutsk having been far separated from the Cro-Magnoids of Western Europe, they have been classified phenotypically and genetically as belonging to the same defining stock as the "Western Hunter-Gatherers," basically as Cro-Magnoids. These people are likely of relation to the Yana

[551] Comas

people of the Sierra Nevadas Mountains,[552] such as around the potentially-active volcano Mount Shasta,[553] a paleo-Amerindian group that likely represents a largely indigenously-evolved population of Americans. These Yana are said to be strongly Otamid admixed, sometimes considered to be Otamids themselves but often considered to have been Melanesians, and, interestingly enough, along with other Native Americans around Shasta— like the Pit River People, Wintu, and Shasta— have occupied the Pit River, known for its many pits (including pit-homes). Neumann believed that people in proximity to one another could either avoid one another or make contact and mix with one another, and these people seem to have done both. South America and the East Coast of North America have a good deal of Melanesian influence, too! The later races would be generally mixed with or derived from the Otamids and Ovejerids, the original inhabitants. These non-Mongoloid people would distinguish Native Americans, especially those most pure in their paleo-Amerindian status, from all other people in the world. It seems that New Guineans or Melanesians may have some Otamid influence themselves, and that this may be, along with or identical with Denisovan input, what distinguishes them from other Australoids, such as the Australian Aborigines and the Veddoids. Melanesians may have had something to do with the Easter Island and Olmec societies, among others, and their genetic influence is readily apparent among many of the Amerindians, especially those with clear paleo-Amerindian influence. The Yana occupied Mount Shasta along with other peoples such as the Shasta people, known for having headmen that did not participate in warfare, instead meeting with enemy headmen and negotiating for peace agreements, suggestive of early collusion between headmen as might later be found among practitioners of *synarchism*, secret government. Under such relations, it is easy to envision leagues of leaders forming a tribe within tribes and conspiring against their own people thereby.

Not directly related, perhaps, though likely distantly so, a mountain in Peru is called *Yanasinqa*.[554] There is also a people at the very tip of South America, in Chile and the Southern Islands, called the *Yamana* people, also called *Yaghan*. Like the Yana, they are known for inhabiting pit-homes. They are reputed to be distinct from the Mongoloid expansion into the Americas by way of Beringia and into Alaska, being considered to be more directly related to Otamids or perhaps Australoids, who are understood to have made it into the Americas even earlier than Mongoloids. Yamana people appear to have some similarities in their phenotypes to Cro-Magnoids or, perhaps more specifically, Lappoids, who have a clear connection to the Ancient North Siberians by way of the Afontova Gora site. A dolichocephalic skull of a Yamana woman was discovered by a rock shelter used for seal-hunting on one of the Northern islands of Antarctica, on what has been named *Yamana Beach*. The skull was dated to only a few hundred years ago. It was from before direct contact with Europeans, though indirect contact was made apparent by the discovery of iron used for blades, likely traded from more Northerly sources.

While the skull is not itself ancient, it begs the question as to whether the Yamana people had ancient knowledge of Antarctica or if it was a more recent discovery.[555] A warmer climate, and a smaller Earth, may have allowed Australoids and ancient Americans to have made contact and shared genes by way of Antarctica. Paleo-Amerindians may, themselves, be a mixture of Australoid with a more ancient species, perhaps American *Homo erectus*, Denisovan, or, on the wilder side of myth or legend, even Sasquatch, as many of them suggest themselves, contributing to the paleo-Amerinidan Otamid phenotype. Considering Denisovan's proclivity for cold, high, and volcanic environments, and its potential familiarization with electromagnetism, Denisovan or one of its relatives may have been from Antarctica.

---

[552] California's rivers are sourced in the Sierra Nevadas

[553] Which, along with the surrounding area, is also blanketed by a geomagnetic anomaly

[554] *Yana* meaning "black" and *sinqa* meaning "nose"

[555] Others have also visited Antarctica. Jacinta Bowler has written that Maori went to Antarctica a millennia before Europeans, apparently extending a tradition of claims made since Percy Smith's prior suggestion of the sort, itself extended by claims of Priscilla Wehi.

Magnetic South is very close to the Bunger Hills area of Antarctica, an area resistant to freezing behind the ice sheet, discovered by David E. Bunger and explored by Richard Byrd and is crew. A shift in poles may have preserved a Native Antarctican population near the magnetic pole there, dousing them in high amounts of polar electromagnetism. From there, the Anatarctic subpolar current could have taken them to Yamana Beach. The Yamana are typically assigned a paleo-Amerindian status with an Otamid-influenced Fuegid or Lagid phenotype, sometimes said to contain Australoid admixture. Their high tolerance to the cold suggests that they have either inherited brown fat from Denisovan similar to Tibetan Sherpas or had independently evolved this trait through convergent evolution. There are also other areas of Antarctica that, while not currently inhabited and while not having evidence of having been inhabited, is not unthinkable for inhabitation by humans. Mount Erebus, for instance, is a volcanic hotspot in Antarctica's Ross Island that has produced a warm, cave-like world in the glacier. The volcanic activity has been around since well before the Stone Age. A small portion of Ross Island, which is connected to mainland Antarctica by way of a permanent glacier, is free of glacial ice and snow. It is noted for its high elevation. The Balleny Islands, a volcanic hotspot, extend from the Ross Sea into the South Pacific toward Tasmania and New Zealand. Belemnite Valley is mostly snow and ice free. Some areas on Alexander Island are ice free. The Anvers and South Orkney Islands are found between Antarctica and South America. Areas such as this, which typically have populations of seals and penguins, could potentially support humans living a similar lifestyle to the Yupiks, Aleuts, and Eskimos or older variants such as the Thule. Oleg Gutsulyak, in *Antarctica is the Original Homeland of the Gods*, has made quite the case that ancient settlements may have existed there. Ancient North Eurasians and the Na-Dene people might carry Denisovan genetics,[556] which appear especially strong among the Na-Dene-speaking Navajo and are likely present in the Clovis people and Kennewick man. This is also found among Kets, Selkups, Nivkhs, etc. and Asians (Altains, Yakuts, Tungusics, Mongols, Koreans, Chinese, Indians, etc.) but less so in Europe, except among Swedes who likely represent a Solutrean or Ancient North Siberian element.[557, 558]

There is a clear connection, as it were, between the Clovis people, the Solutreans, and the Ancient North Siberians, or Yana[559] people, of Yakutsk, which may be followed back to native evolution in the Americas, perhaps around the Yokuts who dwell in the Sierra Nevadas Mountains with the Yana, or even all the way to the Yamana or, wildly, an Antarctic-derived Denisovan. It is likely that the Solutreans came into Europe, and the Yana into Siberia, from Out of America, and thereby contributed to the Cro-Magnoid or Mechtoid as proto-Mediterranoids.

All of the races alive today may be considered to be sapient. Some of the signs of sapience include burial of the dead, care for the sick, and symbolic thinking.

---

[556] Haplogroup Q

[557] It is more common in Eastern Europe than in Western, though Swedes have a strong presence, and Shetland in Britain and France around Lyon does as well. Strong presence in Azerbaijan and in the Hvar Islands of Croatia, once ruled by Illyrians and then Venetians. There is a significant presence in Jews, but not overwhelming. Almost non-existant in Africa.

[558] Some Otamid types, such as the Karankawa, have a tradition where their names cannot be shared with outsiders. The Karankawa also have a tradition where the in-laws of a father and his children cannot come into contact with the father and children, while only the wife was allowed. Like the Yaghans, they have been noted for their ability to have had withstood a great degree of cold. They had a binary chiefdom, with one war chief and one civil chief. They practiced forehead flattening and had tattoos. They are noted to have been sexually dimorphic, with short and stout women and tall and slender men, differing in their skin tones also, with men's being lighter. Men were more groomed and wore more jewelry, including finger rings. They would engage in cannibalism. They raised dogs. While husbands were not said to be particularly affectionate toward their wives, Karankawa women and men alike were said to care much for their children.

[559] Named after the Yana River for the Yana Rhinoceros Horn Site

Socioecology

Ecology refers to the complex interaction of organisms and their communities with other kinds of organisms and communities in an environment, so *ecological relationships* refer to the kinds of interactions that are common between the different participants in the *ecosystem*, the community of communities and organisms in the environment. Ecology describes the relationships between microorganisms, plants, fungi, and animals in a complex, mutually-supporting system. The study of ecology may have begun with Aristotle or Aristotleans such as Theophrastus, or perhaps with Carl Linnaeus and his inquiry into "the economy of nature." But it would really take off as a discipline with people such as Eugen Warming, Andreas Franz Wilhelm Schimper, Gaston Bonnier, Francois-Alphonse Forel, Stephen Alfred Forbes, and Karl Mobius, and would become solidified upon being named *ecology* by Ernst Haeckel. Warming had been a Lamarckian thinker, focusing on *phenotypic plasticity*, or the way that plants develop differently according to the conditions they faced, which he believed showed that Darwin's gradual evolution was not a limiting factor and that organisms can adapt to a wide range of circumstances. Rather than natural selection, Warming favored the inheritance of acquired characteristics and hybridization as mechanisms of evolution. Haeckel popularized Darwin's work while maintaining some skepticism, as he was a proponent of Lamarckism, Spencer's social Darwinism, and of eugenics.[560] He was also a monist, Romantic, and understood social science as applied biology. He believed that evolution occurred in a polycentric fashion.

Organisms relate to one another in competitive and cooperative manners, as can be seen in the trophic pyramid and in the process of *ecological succession*, the serial exchange of dominance, or success, from one element of the ecosystem to another.[561].

The *trophic pyramid* describes the structure of the *food chain*, the arrangement of which organisms consume which others. In the trophic pyramid or the food chain, organisms relate to one another primarily as the eater or the eaten, although this view must be complemented with an understanding of ecological communities, wherein it is understood that some of the organisms on the lower strata of the trophic system could never be available foodsources for those in the higher strata who are part of a prior phase of succession. For instance, an insect that relies on forest will not become prey to a desert bird without some kind of anomaly or disturbance having been caused, despite the bird being higher on the trophic pyramid and from the same location as what has become a forest. That's a major part of evolution, applying the ecological pressures of natural selection to sculpt species to fit one another. At the bottom of the trophic pyramid, or food chain, are the *primary producers*. These are organisms that produce primarily from the energy of the sun using basic components. These are organisms like algae and plants. These are followed by *primary consumers*, who consume the primary producers, such as with insects. *Secondary consumers*, such as birds and rodents, consume the primary consumers. These might be consumed by *third-level consumers*, perhaps such as a raccoon or a fox, which might in turn be consumed by a cougar or a human, a *tertiary predator*. The lower the level of the pyramid, the more

[560] Early on, *eugenics*, which was a term coined by Francis Galton, was more about selective breeding than it was about state control. In fact, the earliest popularizer of eugenics in the United States may have been the anarchist, Moses Harman, who put out a magazine called *Eugenics*. Other famous eugenicists include the anarchist Emma Goldman, whose influence can be found in Margaret Sanger, who took the anarchistic philosophy and adopted it for purposes of Malthusianism applied by the state. Many of the things that we are told are bad have actually been twisted to make them bad, as with anarchism, which today is associated with all kinds of degeneracy to which the original anarchists were opposed.

[561] In a certain respect, ecological succession is similar to the larger cosmic changes involved in phase transitions. Likewise, and in a fractal or holarchic manner, ecological succession may be similar to revolutions or phase transitions. Indeed, phase transitions may be responsible for ecological succession, which may in turn be responsible for revolutions.

energy-efficient, and the less energy lost into the environment, but also the less energy-dense. The higher levels, as a consequence, require many more members of the lower level than of their own. It takes many insects to feed a bird, for instance, and many more plants to feed those insects. *Ecological succession* entails the shifting of animal and plant communities, and so also a shift in the trophic pyramid.

When ecological succession occurs, different plant and animal communities take control, displacing the earlier stage and establishing a new trophic structure. New plants will feed new insects that are adapted to them, and new insects will feed new birds whose beaks are designed for them, and so on. Those who fed on the earlier plants, the earlier insects, and etc. either become deselected or must find a new habitat, adapting thereto. Ecological succession, then, is the ebb and flow of evolution.[562] Ecologist Nicholas J. Gotelli suggests in his work, *A Primer of Ecology,* that "*succession*—broadly defined—is the change in community structures through time."[563] He says further that "ecologists made two interesting observations about colonization following a disturbance," a *disturbance* being an external force that has disrupted the ecosystem. Nicholas says that they saw that "the species that showed up immediately following a disturbance were often very different from the species that would show up later in time," and that those "pioneer species have life history traits that allow them to thrive in the harsh physical conditions of a newly disturbed patch." These often include plants with thorns or spines on them. Gotelli says, "these pioneering species do not persist indefinitely, and are eventually replaced by other species." This replacement generally entails some co-evolution and mutualism, with each stage increasing in mutualism as it goes forward. It also involves some convergence, as Nicholas describes when he says that "communities that are disturbed in different ways and look different to begin with may become more similar through time." An example of this convergence is given, that "forest patches that are damaged by windstorms, cleared for agriculture, or selectively logged may [...] converge to a similar structure of secondary forest growth a century after the last disturbance." Gotelli concludes that "the presence of pioneer species and the convergence of communities following disturbance" had "suggested that changes in species composition during succession were deterministic, not random."[564] This increase in mutualism and convergence, associated with convergence, just about always goes this way.

There *are*, however, cases in ecology that demonstrate monopolization, but under certain conditions which eventually change. The "inhibition model" may explain a situation in which "initial colonists suppress the arrival of later species, whereas in the facilitation model, pioneers promote the entry of latecomers."[565] Indeed, there does appear to be an element of monopolization going on when it comes to human political communities, too.

Humans live in *communities*, or groups, which can be singular or multiple (as with a community of communities, such as a clan of bands, or a tribe of clans), and which compose a society. A *society* is a group of people who are engaged in consistent interaction for some common benefit. This can occur within a single community, or between communities in a multi-community society. Human societies as a whole, and not only individual humans, also face natural selection. And the human ecosystem, the

---

[562] No matter how important humans may think that they are, they are only one piece of the overall life system, the system of ecology and, even as primary consumers, their bodies themselves will be consumed by *decomposers*, organisms such as fungi that serve the primary ecological function of breaking down the dead matter left over by waste in the trophic system, themselves being somewhat extended between levels, consuming the dead as scavengers but also cohabiting and being eaten with the consumers by higher orders.

[563] Gotelli, 180

[564] Gotelli, 181

[565] Gotelli, 182

societal (including political) system, like any ecological system, undergoes succession. As organisms compete in the ecosystem, so too do societies, leaving survival to the fittest for the situation. Because the political system is ultimately an extension of the ecological, it is important to view political succession through an ecological lens, too. Like an embryo, which grows through the same stages with each unique person, ecological and ultimately political communities, in order to grow, and left to their own devices, must follow a certain pattern.

Sociology, the study of human societies, would have its proper beginning in the thought of people such as Henri de Saint-Simon, a utopian socialist who identified the industrial revolution as a source of potential positive political change, encouraging the creation of an international league of scientists to direct societal efforts away from war and toward societal betterment and the establishment of a society led by the *industrial class*, otherwise known today as the *producer class*, which included capitalists, small business owners, and wage laborers. This stood in opposition to an *idler class* composed of people such as aristocratic landlords. Himself an aristocrat by birth, he renounced his title. He saw society as largely driven by class conflict. Auguste Comte formulated a sociology of *positivism*, wherein he believed that society moved from a theological to a metaphysical and then a coming positive stage, which culminated in human emancipation from supernaturalistic thinking. Many strains of thought had contributed toward sociology, including economics most especially, as well as history, religion, anthropology, and the humanities. The Physiocrats, such as Turgot, were greatly influential in this regard, as was the rhetorician Giambattista Vico who seemed to echo the historical lessons of Polybius, German idealist philosophers such as Rousseau, Kant, Fichte, and Hegel, or English socialists such as William Godwin, William Thompson, and the Ricardian socialists, or French ones such as Charles Fourier and Robert Owen, among many others. Utopian thinking, coming from out of Saint Thomas More's conception, and following a long line of Platonist thought, was certainly a major influence on the development of sociology, as sociologists would tend to concern themselves with the elements of society that kept it from achieving the heights of *utopia*, literally "not a place," but meaning an ideal condition. Standing especially in the way of utopia were traditional class relations of domination that had been long-established, as well as some newer forms such as Southern slavery in America and industrial wage labor throughout the developing world. Continuing in the social pursuit, sociologist Pierre Proudhon would stress the mutualistic and sometimes antagonistic nature within society, suggesting that its dynamics were leading it toward an ever-greater societal equilibrium that balanced the needs of individuals and collectivities, a condition that through the course of time would abolish government as an encroachment on freely united individuals. Herbert Spencer thought similarly, but stressed the importance of biological evolution, particularly the adjustments of human sentiments to the needs of society as dictated by Reason and as resulting by way of natural selection working in favor of the evolution of *ethics* and *morality*, opinions regarding treatment of others and self. Lesser thinkers, such as Karl Marx and Emile Durkheim, would also become famous sociologists, though their ideas were far less useful.

Perhaps the model of social development that most consistently applies the principles of evolutionary biology, sociology, and ecology to human societies was developed by Gerhard Lenski, supported by his associate Patrick Nolan. Theirs is a macrosociological theory called the *ecological-evolutionary theory*. In it, Nolan and Lenski lay out the manner in which ecology ultimately affects the development of subsistence technologies (such as the hoe, plow, and combustion engine), which are the main determinants of economic conditions and political structures. To my view, and whether intentionally or not, they successfully provide insight into the workings of the *anacyclosis*, or political cycle (as described by Polybius, for instance) in the process, which naturally must be oriented within the framework of ecological succession, terms of which they use to describe their model of societal

development. For Lenski, the main force of societal evolution is intersocietal selection. Patrick Nolan, Lenski's cohort, and Gerhard Lenski, himself, say that the "key to the major changes that have occurred in the world system of societies"[566] "is the process of intersocietal selection that has drastically reduced the number of societies. Were it not for this process," they suggest, "in which the units that survive (or become extinct) are entire societies, human life would not have changed nearly as much as it has." They make clear, that

> Intersocietal selection occurs when a society ceases to exist as an autonomous entity. This can be the result of conquest or absorption by a more powerful society, or disintegration as a result of a natural disaster, environmental change, food crisis, or epidemic disease. Throughout human experience [...] societal extinction has been the result of contact and conflict among societies, and warfare and disease, either singly or in concert, have played the most powerful role. As a result, larger, more technologically advanced and militarily powerful, and more disease-experienced societies have prevailed, and they have come to constitute an ever larger proportion of the world system of societies.[567]

Taken at face-value, Nature can appear quite cruel at times. It is no different if a lioness tackles a gazelle or a superior society displaces another. Still, this is how she appears to do some of her most important work. It is not purely unfair if we look beyond the surface, however, because what Nature is doing is allowing for greater degrees of experience overall. When a superior society displaces another, it typically affords a larger population, which allows for more lives to be experienced overall, and often at a higher level of evolutionary development. As Nolan and Lenski tell us,

> Not all differences that have developed among societies have been equally important from the standpoint of intersocietal selection. Differences that influenced societal growth and development have been especially important, because societies that have grown in size and developed in complexity and military power have been much more likely to survive and transmit their cultures and institutional patterns than societies that have preserved traditional social and cultural patterns and minimized innovation.
>
> The reasons for this are obvious. To survive, societies must be able to defend their populations and territories against a variety of threats. These include [...], above all, threats from other societies.[568]

They say,

> Societies that effectively cope with their biophysical and sociocultural environments continue to exist as autonomous systems, those that don't either break up or are incorporated into other systems. Although societies with large effective bodies of cultural information are more likely to survive and pass on their traits [...], diffusion allows much of the cultural information of systems that fail to survive to be preserved and passed on within the world system of societies.
>
> Because technologically advanced societies have had the advantage in this process of intersocietal selection, their characteristics have increasingly come to be the characteristics of the world system as a whole.[569]

[566] Placed "in the last 10,000 years"
[567] Noland and Lenski, 64
[568] Noland and Lenski, 64
[569] Nolan and Lenski, 70

In other words, Nolan and Lenski are pointing out that societies, like organisms, face selection by their environments, which include the presence of one another. As such, those societies that better compete for and manage resources and cultural technologies, and by extension develop a positive feedback in the production of larger populations, tend to deselect the others.

As outlined by Patrick Nolan and Gerhard Lenski, and when informed by James Woodburn's concept of *immediate return societies* vs. *delayed return societies*, human development goes from various stages starting from foraging and scavenging and low-order hunting and gathering societies, that immediately consume what they find, and then hunting and gatherting societies that might start to store some food, and on to herding, fishing, and horticultural societies, which themselves develop into maritime and agricultural societies, before industrializing, all of which are increasingly preserving their products for longer spans of time. The smallest of human societies is the Stone Age *band society*, typically a small extened family, followed by the Copper Age *clan*, a collection of bands, a Bronze Age *tribe*, a collection of clans, and then the Iron Age *nation* and *empire*,[570] and finally by the world society of interacting civil and political units, as exists today in the Oil Age. It is possible to imagine a world society in which political units are entirely absent.

While there are material constraints, and subsistence technologies certainly appear to establish the upper limits of what a society can achieve in the present, Nolan and Lenski stress that there is a major difference between cultural and biological evolution. Indeed, Edward Burnett Tylor, a cultural evolutionist, suggested that societies develop through three stages from savagery to barbarism to civilization. He did not believe in major differences in human intelligence. He did, however, believe animism to be the foundation of all religion, though was himself a supporter of deism. The point of his cultural anthropology was that humans of any race could eventually go through all of the various stages of cultural development. People such as Pierre Teilhard de Chardin and Jean Gebser would provide an orthogenetic,[571] developmental, or phenomenological approach to psychology in much the same way, following after Tylor's impact. Building also upon the tradition initiated by Tylor, and having stated their own proclivity toward a degree of Lamarckism, which they anchor to cultural matters especially, Nolan and Lenski say, "[s]pringing from the easy flow of cultural information among societies and the ease with which it is incorporated into heritable form is" a "way in which sociocultural evolution differs from biological: it has given rise to much higher rates of change in our species." This differs from simple genetic changes, which are "necessarily a slow process in a species that has a long generation span and relatively few offspring," instead being able to be "rapidly acquired, exchanged, recombined, and accumulated, with the result that substantial alterations in a society's culture may occur within a single generation." As such, "sociocultural evolution may have a greater potential than biological evolution for being brought under rational human control," though "this process has hardly begun."[572]

We are genetically evolved—our instincts and impulses are suited— to exist in small band societies, but our technology has allowed us to develop beyond the capacity that we are genetically most suited for, such that we are now selected by artificial environments of our own creation.[573] The fact that humans can affect our own evolution in this way, and even in a conscious and directive fashion, is known as

---

[570] Following a period of hunting and gathering, and sometimes herding or fishing, advanced horticultural and agricultural as well as maritime societies would develop into advanced civilizations, including those of a democratic or republican and imperial nature

[571] The view that evolution is teleological

[572] Nolan and Lenski, 72

[573] While the political equality of hunter-gatherers does incite feelings of excitement about what is possible for human beings, the problem persists that technological development has made the informal or customary social structures of hunter-gatherers relatively ineffective

niche construction. As Robin Dunbar, Louise Barrett, and John Lycett suggest, in *Evolutionary Psychology*, "[n]iche construction means that adaptation [...] becomes two way, with populations of organisms setting problems for themselves, as well as solving problems set by the environment."[574] There must be something said in regard to the fact that human societies establish niches for greater degrees of communication so that problems can be resolved. Indeed, Robin Dunbar holds that *social grooming*—gossiping about others in order to protect one's allies from their negative behaviors, similar to apes picking fleas or mites off of one another— led to the development of human language. This was only necessary because groups had already been formed, but some wanted to play the role of "free rider," a sort of social parasitism.[575] Dunbar, in *Grooming, Gossip, and the Evolution of Human Language*, says that language

> allows us to exchange information about other people, so short-circuiting the laborious process of finding out how they behave. For monkeys and apes, all this has to be done by direct observation. I may never know you are unreliable until I see you in action with an ally, and that opportunity is likely to occur only rarely. But a mutual acquaintance may be able to report on his or her experience of you, and so warn me against you—especially if they share a common interest with me. Friends and relations will not want to see their allies being exploited by other individuals, since a cost borne by an ally is ultimately a cost borne by them too. If I die helping out a scoundrel, my friends and relations lose an ally, as well as everything they have invested in me over the years. Language thus seems ideally suited in various ways to being a cheap and ultra-efficient form of grooming.[576]

The ability to communicate with the use of signs and symbols, such as verbal and written language, is a characteristic that make us uniquely human. Human societies experience the constant opening of niches,[577] sometimes completely novel and entirely life-changing, and these niches demand filling.

Through niche construction, human beings have an influence in the direction of their own evolution. But niche "construction" is not really the case when we get down to the brass tacks. Rather, it should be seen as the *discovery*, not the *construction*, of new niches.[578] Niche construction and ecological succession necessarily involve establishing something that cannot last, though. In the "facilitation model" of ecological succession, for instance, Gotelli says that "alterations facilitate, or 'pave the way,' for the next group of species to invade while simultaneously making the environment less suitable for the original set of pioneer species."[579] Evolution still takes place.

High states of mutualism, as are found in ecological climax communities, come after aggressive stages of colonization and pioneering. This is found demonstrably true of ecology; and humans, being members of the ecological community and being anything but outside of its laws, must obey them. The Mutualist anarchist, Pierre Proudhon (whose ideas serve as the foundation of biological mutualism), in his *The Federative Principle*, also proposed a progressive, evolutionary "political" succession, compatible with ecological succession, when he said that

---

[574] Dunbar, Barrett, and Lycett, 28

[575] The free rider (or parasitism or communism) problem is one that persistently detracts from genuine attempts at mutualism, giving rise to the need to establish systems that prevent the free rider from leeching from everyone else's efforts. Unfortunately, attempts to prevent unofficial free riders often lead to institutionalizing officialized free riders, such as royalty or politicians.

[576] Dunbar, 79

[577] Compare this to William B. Greene's "Blazing Star" spoken of later

[578] The revolutionary social concept of *Mutualism* is an example of an attempted niche construction, resulting from a *conatus* for mutualism that has its source in retrocausality

[579] Gotelli, 181

> you will notice that both principles, Authority and Liberty [...] show themselves in history in chronological and logical succession. Authority, like family, like the father, genitor, is the first to appear; it has initiative, it is assertion. Questioning Liberty [...] comes afterwards: it is criticism, protest, determination. The fact of this succession results from the very definition of ideas and the nature of things and the whole of history testifies to it. There, no inversion is possible, nor the least trace of the arbitrary.[580]

Proudhon goes further into the mechanics that give rise to succession in his *System of Economic Contradictions*. Essentially, though, Proudhon argues that society evolves increasingly in the direction of Mutualism through the process of succession and— though he doesn't use the term— niche construction.

The colonizing pioneer principle of authority is expressed in "our" political structures, which, during its horticultural phase, had started tending more and more to brutalism and control. As if for a colonizing or pioneering plant species in ecological succession, the new niche afforded by climate change and human technological progress demanded aggressive action to fill it, and a new means by which to do so.[581] As with the pioneering species—the weeds and thorns—, authority filled the niche. Such was a state of low mutualism, but an important stage of pioneering succession, nonetheless; a stage that was needed to precede the high mutualism conditions of what is to come from a climax community. Then came the modern and especially the industrial era, when— as Nolan and Lenski point out— the ruthlessness of the beneficiaries of stratification started to slow down, and democracy and human and civil rights began to be won.[582]

While ecological settings may establish certain limits and conditions to the evolution of society, it would be mistaken to consider human societies to be purely, or even primarily, deterministic, in the mechanical sense.[583] Subsistence technologies are important drivers in evolution, but these are not produced entirely by a physical environment, but by way of correlation of the physical environment with psychological forces. These psychological forces, when it comes to human evolution, appear to be the main driver. Technologies are relics of human thought. The field of *socionomics*, for instance, is established upon the idea that human psychology is the major driver of change. Robert J. Prechter, Jr., in *The Wave Principle of Human Social Behavior and the New Science of Socionomics*, says that

> Social mood trends represent changes in human attitudes. Changes in social mood trends precede compatible changes in history and culture, indicating that the former changes the latter. Thus, there is powerful evidence that the pattern of mood change produced by the social interaction of men is the underlying engine of the trends of social progress and regress.[584]

Prechter, Jr., following after Ralph Nelson Elliott, proposes that Nature's growth takes a "three-steps-forward, two-steps back" pattern whereby "five waves" follow "net movement in the direction of the one larger trend followed by three waves" that push back. This is consistent with the idea that Nature or spacetime takes the form of a spiral, wherein linear and circular processes dance. Indeed, Prechter, Jr.,

---

[580] Proudhon[1], 692

[581] This was a niche for order-creation in societies in which fundamental biology had not provided a means. Human beings were evolved to exist in small bands, but not big societies. But culture and technology enabled big societies, and the result was a constructed niche, which created a demand for a colonizing or pioneering force to fill it. Colonizers and pioneering species are quite typically aggressive, and this is related to their ecological function of filling unused spaces quickly.

[582] Nolan and Lenski

[583] They are, nonetheless, determined in the retrodeterministic or teleological sense

[584] Prechter, Jr., 15

affirms that "[f]ractal, spiral, and Fibonnacci phenomena in biology and human perception and mentation suggest a biological basis for the phenomena."[585] Struggling to have come up with the best descriptor for what he otherwise calls "social mood," Prechter, Jr. says that, perhaps the best alternative might be a Greek word, meaning "to strive," *maiesthai*.[586] The ultimate source of this striving, found biologically in the organism, especially the human being, is *syntropy*, the process that runs counter to entropy. What is being empirically graphed in fields such as socionomics is the effects caused by the future, itself largely unknowable, and from how far it extends we cannot currently be certain.[587]

Unlike ecological disturbances, which generally (though not always) take place by way of external pressures, political disturbances can just as well occur internally. *Maiesthai* or *conatus* provides a means of political disturbance. Perhaps there is an analogy to be found in the ecological world,[588] but, among humans, widespread communication of important ideas— as had occurred during the Renaissance, Reformation, Scientific Revolution, Enlightenment, and so on— can lead to a sort of phase transition or succession in society, a *revolution*. Unlike in ecological relationships between organisms, however, the social relationships between humans might not always require the displacement of others,[589] as humans are individually capable of adapting to new societal niches, or roles. Political succession, then, does entail the displacement of old roles, such as *king*, answering only to his small court in a monarchy, and it does also entail their replacement with new ones, such as *prime minister* or *president*, accountable instead to a parliament or congress in a constitutional government or republic. Such succession moves society away from more pioneering societal or political structures toward more climax systems, ideally a society lacking politics altogether, with confederation but not government or state, such as with Mutualism, which would replace presidents with facilitators and congress with general assemblies, as well as employees with worker-owners and tenants with owner-occupants, restoring the equality once shared by hunter-gatherers, not by regression to disorder, but by progression of order past private domination and toward mutual co-operation, thereby making the order provided by government and state obsolete. The anarchy of Mutualism is not that of the hunter-gatherer, of the pre-state society, but of the post-industrialist, of post-state society. As such, Mutualism is civil society without politics.[590] For anarchists such as Rudolph Rocker, the distinction between physical necessity and human agency was very clear. Physical, material conditions set the limits, but within those limts human beings have a great deal of agency, owing to their will.[591] He says that

> in social events it is always a matter of a causality of human aims and ends, in nature always of a causality of physical necessity. The latter occur without any contribution

[585] Prechter, Jr., 15

[586] This word is similar to *conatus*, the word preferred by the radical and heretic, Baruch Spinoza, when he kicked off the Radical Enlightenment. Consequentally, it provides a strong foundation for radicalism.

[587] The extent to which we are compelled by the future has to do with our success, for there is no success without a future, as duration into the future is the ultimate measure of success. This can apply to individuals but also to collectivities. For many of the heretics and radicals, driven as much by spiritual and collective as by hedonist and individual concerns, the future extends far for the collective, but was cut short for the individual, many of whom were executed for their beliefs or their willingness to revolt against established authorities. This willingness, which ultimately gave form to republican societies, was itself a form of *conatus* or *maiesthai*.

[588] It has been found that trees and other plants communicate with one another by way of a kind of biological internet that occurs by way of the mycelium, or root-like structures, of mushrooms. Indeed, "magic" mushrooms have long been associated with psychological affects. There are even predatory fungi known to take over the brains of ants. So the connection between fungi and intelligence and information is fairly well-established.

[589] However, intersocietial selection does often involve displacement and can even involve genocide. In the past, there has been some correlation between speciation and succession. But that correlation has typically seen the emergence of new races by way of hybridization, which then assert dominance.

[590] Civil society is composed purely of voluntary associations (or societies), oftentimes the scale of a band society but at times growing as large as nations or empires

[591] Rocker, a Nietzchean, explicity suggests the "will to power"

> on our part; the former are but manifestations of our will. Religious ideas, ethical concepts, customs, habits, traditions, legal opinions; political organisations, institutions of property, forms of production, and so on, are not necessary implications of our physical being, but purely results of our desire for the achievement of preconceived ends.
>
> [...]
>
> Every process which arises from our physical being and is related to it, is an event which lies outside of our volition. Every social process, however, arises from human intentions and human goal setting and occurs within the limits of our volition.[592]

The distinction between physical causation and goal-setting is rooted in the distinction between entropy and syntropy. Both entropy and syntropy play out in the operations of society. But whereas entropy is a matter that is largely outside of our doing, syntropy expresses itself in our will, itself associated with our mood, a reflection of our understanding.

Among the capacities of humans to use their agency and to strive, to consciously evolve rather than to simply be fated, are the creation, maintenance, and— when needed— replacement of norms. *Norms* include the full range of social expectations or suppositions, from the less important ones such as folkways up to the level of laws. *Folkways* are the standard practices of a people, similar in some respects to the *best practices* found in industries, which have been widely adopted and normalized because they have been understood to provide the best results. These include such things as manners, customs, conventions, etiquette, popular acts of politeness and common courtesies, and the division of time throughout the day for common things such as waking, eating, working, and sleeping. To go against a folkway or a best practice may not necessarily be considered to be a moral or ethical wrong, though it may be considered to be foolish or barbaric, and cause for criticism, ridicule, mockery, or even scorn. *Mores* are moral or ethical norms of society regarding conduct, the breach of which results in some sort of shaming, shunning, or ostracism, typically much more severe than what occurs with breaks from folkways. *Laws* are norms that have developed from out of *taboos*, things that are strictly forbidden, often for a moral, ethical, religious, or political reason. A *law* is a rule of a society the infringement of which results in direct remediation or punishment by force, often resulting in physical punishment, banishment, or death. Whereas other forms of norms do not involve force, unless they are themselves laws, laws are defined by their potential or actual use of force.

We have *conditioning*, or habituating, effects on one another as one another's environments, such that we can influence one another's behaviors by the way we treat each other. By treating one another well and rewarding one another's positive behavior, we may bring one another's wellbeing up and cause positive mental associations with sociality, thereby neurologically rewiring one another toward pro-social behavior. Similarly, by maintaining justice, or by punishing bad behavior, negative mental associations with anti-social behavior can be established. This can also occur on the level of *ideologies*, the normative systems and beliefs held by groups— such as religious and political beliefs—, and on the scale of communities that, later in the development of humans, have even reached the size of empires. Ideological groups are constantly battling to win the approval of peers, to establish positive associations in the minds of peers with the ideological group, in order to build support to somehow put one's ideology into practice, often, though not always, in an "us against them" victory. These kinds of struggles can lead to simple changes of norms or even to "paradigm shifts" of various kinds, including political revolutions.

---

[592] Rocker[1]

Another capacity humans have is that of *non-conformism*, of going against the grain when norms are wrong. This requires being principled. Being *principled* means sticking to one's *principles*, one's comprehension of the laws of Nature, and not infringing them, especially when it is difficult to do, such as when a majority is saying to do otherwise. Principled individuals, if their principles are superior to the norms of an existing group, and if they are confident in those principles, can influence the consensus in groups, can cause factions and splits, or even revolutions if those principles lead to a paradigm shift and the establishment of new norms. This is risky, however, and if the non-conformist fails they may be declared a heretic or a radical unfit for the society, and even killed for going against the social norms.

Non-conformism and social conditioning are not necessarily at odds, but are instead two forces that are both needed, one to challenge existing norms with better ones and another to maintain norms until better ones prove their worth.

Hunter-Gatherer and Stone Age Society

Primitive society was composed of bands of people and small tribes with limited technology. Band societies would rarely produce a political hierarchy, being much too small. They would instead tend to be *acephalous*; that is, would lack a headman. Otherwise, they might have had a leader who acted within a functional capacity, accountable to the group, and not outside of those limits; someone more like an elected captain. This put them largely within the bounds of intraspecific (within the species) biological mutualism. Patrick Nolan and Gerhard Lenski, for instance, suggest that in hunter-gatherer societies there is essentially little to no political authority. They say that "political authority with the power to coerce is virtually nonexistent [among hunter-gatherers]." Yes, they permit that "differences in influence exist," but they qualify that this is "only to the degree permitted by those who are influenced, and only as a result of respect for another individual's skills or wisdom. When individuals lose this respect," they say, "they also lose their influence."[593] Oftentimes, and probably most commonly among Stone Age hunter-gatherers, there is no institutionalized hierarchy whatsoever, not even a basic headman. There are merely interrelations between members of the community. However, there are times when communities make use of a headman for practical reasons. Nonetheless, as Gerhard Lenski says, this time on his own, in his work *Power and Privilege*,

> Even in those groups which are governed by a headman, his powers are usually quite limited. To begin with, they seldom extend beyond the bounds of his own band and when they do, they are extremely tenuous. More serious limitations arise from the fact that the headman has virtually no tenure or authority.[594]

Gerhard Lenski here refers to the kind of authority exhibited by the headmen of hunting and gathering societies as rather purely "*functional authority*," and points out that such authority is often granted to those with accumulated honor and prestige, in an act of reciprocity, in which "potentially disastrous inequalities in subsistence are transformed into inequalities in prestige and influence, a much safer and more satisfying arrangement." This is done by having "the less able members of the group reward such a person with prestige and influence in exchange for a share [of his production]."[595] He says that, "[b]y this spontaneous and uncoerced exchange, those who are generously endowed by nature with talent and

[593] Nolan and Lenski, 93
[594] Lenski, 107
[595] Lenski, 105

energy are stimulated to produce more, and those who are not have greater assurance of obtaining the necessities of life."[596]

These examples serve to demonstrate that political hierarchies and governments are not something ingrained in the human species. Quite the contrary, the biological condition of human beings, stemming from the context that we are biologically evolved to exist in, is one of relative equality. Due to the lack of hierarchy and headmen, human societies before the evolution of coercive hierarchy were largely within the bounds of biological mutualism. This owes itself to the fact that social orders like those described by Lenski exemplify those we were longest exposed to, as human beings had been hunter-gatherers for much much longer than we have lived in industrial societies. Industrial societies are but a tiny fraction of the human experience. Mutual aid as a cultural technology, however, was less established as a tradition, and would be until the horticultural era. People merely practiced reciprocal altruism as a matter of familial instinct and custom. Human societies are not basically biologically conditioned to order of the level required by advanced lifestyles, which is why we have culturally established political hierarchy, seemingly against our biological instincts. It would take some time for mutualism to evolve into a cultural technology capable of strong solidarity through mutual understanding or contract.

That human societies were less violent when we were living as hunter-gatherers runs quite contrary to the progressivistic assumptions of many: that primitive people are by their nature more brutish and domineering. Counter-intuitive as it seems— due to immersion in governmental propaganda—, the social science shows that human beings are genetically suited for a primitive anarchy of headless bands, or with "functional hierarchies" (not a hierarchy in the anarchist sense of it) limited by the merit of the functionary. Many of our social problems result from divergence from this[597] condition, though some benefits do accrue from it as well. That early societies lacked political authority may tickle the senses of the anarchist reader, critical of authority. Noam Chomsky, after all, defines anarchism as the philosophy that authority is not self-justifying, but that the burden of proof rests on authority. The society of the hunter-gatherer, in many respects, is exemplary of such a condition. However, Chomsky, a self-declared anarcho-syndicalist, suggests that "anarcho-syndicalism [...] simply regarded anarchist ideas as the proper mode of organization for a highly complex, advanced industrial society."[598] Hunter-gatherer societies have certainly fallen short of such a task. And Chomsky, a reasonable guy overall, doesn't suggest going back to hunting and gathering. While hunter-gatherers and simple horticulturists generally lack political authority, they also lack strong, multi-community organization.

Many anthropologists and sociologists hold that problems of political violence accelerated with technological changes that made societies less manageable for their members by way of their own instincts and old customs. That this is so has given rise to evolutionary psychology, which looks at the results of biological evolution's attempt to keep the pace with cultural evolution. Larger societies would demand more rational and orderly structures, and these would often not be put into place except by the most cunning and capable of forcing them onto others. This represents an early stage of ecological succession, as will be discussed later.[599]

Primitive people generally lack notions of ownership of private property in land. This owes itself to the fact that most of human existence has been spent as nomadic hunter-gatherers, in which people did not

[596] Lenski, 105
[597] Nearly-Rousseuian
[598] Chomsky[1]
[599] Any successful anarchy—such as that proposed by the Mutualists—must find a way to maintain order—the ecological niche demanding to be filled— while eliminating hierarchy and coercion, if it is to claim a place as a climax system and not revert to primitivism

spend a lot of time in the same location for too long.[600] While tribes may develop traditional territories, in which they would generally cycle, these were, by no means, without dispute or change, and were themselves dependent upon tribal occupancy and use (a common notion regarding a precondition of Mutualistic property relations). Displaying the mutualism of early societies,[601] Nolan and Lenski relay to us that

> the concept of private property has only limited development among hunting and gathering peoples. Things that an individual uses constantly, such as tools and weapons, are always recognized as his own, but fields and forests are the property of the entire society.[602]

The earliest form of economy probably looked a lot like sharing between immediate family members in small bands, likely facilitated but not controlled by an assertive or suggestive father. A mother— and perhaps her mother, sisters, or children— might receive food acquired by the rest of the band, and that she also helped to gather, being responsible for preparing it for consumption. Before this level of specialization, which was according to gender, hunting and foraging likely resulted in immediate consumption by the band. Delaying the returns and specialization would contribute toward the growth of bands into larger units, such as clans. However, there may have been some early attempts to regulate debt relations or even to make a means of exchange, such as with the caches of shells found on Mount Carmel or the "Wolf Bone" tallystick associated with the Aurignacian culture.

Life in the Stone Age was not all fun and games, however. According to the psychohistorian Lloyd DeMause, there was actually quite a lot of child abuse going on. Lloyd deMause has suggested, upon anthropological evidence, that primitive people would regularly infanticide their children, including torturing them to death, and that this was an acceptable practice in their societies. He argues that this left the siblings of the infanticided children mentally disturbed, which has been associated with *bicamerality*, or a compartmentalized brain hemispheres, such as can be associated with schizophrenia, as proposed by Julian Jaynes. Such a disturbance, it would seem, mirrors the disturbance of an ecosystem, in that it produces very unfriendly "pioneer" behaviors, as primitive people would certainly be the pioneers of human social structures, and their societies are full of immoral behaviors. He believed that this was done by parents who were psychologically dissociated. Some psychohistorians hold that primitive people lack the desire for an exchange of "mutual gazing" with their children, important to psycho-social development. Whether this is the case of early modern humans of the Middle Stone Age, or if it occurred only after particular stresses, such as those of the Younger Dryas, is hard to tell.

In a certain respect, and despite the horrors of child abuse, the mutualism of the Stone Age hunter-gatherer that did exist, in a society lacking coercive hierarchy, represents a climax in early human, and indeed Great Ape, relationships. This climax, however, would be disturbed—perhaps in three steps backward—, especially by the onslaught of the Younger Dryas, which set humanity back into pioneering mode, giving rise to vicious hierarchies and political authorities of the Copper, Bronze, and Iron Ages that it remains our duty to evolve past today as we move past the Oil Age.

---

[600] Hunting and gathering has been the most prevalent means of subsistence activity in the human past, even as it regards *Homo sapiens sapiens*, the modern human

[601] Modern Mutualists distinguish the "private" property of the first sort, rather, as *personal* property, or possessions, than *private* property, which they would reserve for land. While not consistently used by *all* Mutualists (for instance, Thomas Hodgskin or Clarence Lee Swartz), this is an important philosophical distinction that Proudhon, the first explicit anarchist, had made, and that most Mutualists of today get behind, even if they do not consistently adhere to the language.

[602] Nolan and Lenski, 93

The Age of Cosmological and Biological Mutualism

The age of cosmological and biological mutualism refers to the era, within an eternal Universe, in which the only sort of mutualism to be found was of the biological and, at most, semi-conscious sort, induced through cosmological forces of survival, such as the execution of immediate goals. Natural selection produces— as facilitated by retrocausality and by way of ecological succession— a climax in peak mutualism when it gets the chance. Such a peak of mutualism was found among *Homo sapiens*, though it was informal. While steady for millenia, it eventually gave way to more exclusivistic, noble practices of mutualism. This establishes a second story in the house of human mutualism, a second, political layer, atop a biological or instinctual one. We will continue on to that.

THE AGE
OF
ARISTOCRATIC & NOBLE MUTUALISM

Looking at mutualism from its barbaric to its medieval state, and the practices of mutual aid that led to civilization and the aristocratic and noble form of the state

Borean Albinos

What is commonly referred to as the *white race*— white Indo-Europoids— is really just a collection of (sometimes Neanderthal-crossed) albinos[603] from Eurafrica and Eurasia, sourced from out of Iberomaurusian Mechtoids and Cro-Magnoids,[604] Afro-Levantian Levantoids and Caucasoids, West Asian Australoids finding their way to the Zagros, and, later, Polynesians, possibly coming from both East and West, if not also paleo-Americanoids coming from Out of America.[605] Albinos from Africa and India, at the very least, had combined, that is, primarily in the Levant, Zagros Mountains, and the Caucasus, to form that larger race that might best be referred to as *Indo-Eurafricanoid* or *Indo-Europoid*, having a *Eurafricid* wing in Europe and North Africa and an *Arabo-Afghanid* or *Indid* wing natively in the Middle East or West and South Asia, including the Arabian Peninsula across to India.

The Eurafricid wing would include among it mostly Mediterranoids, Alpinids, and Nordids, with some Caucasoid (and a substrate of the more ancient races[606]). The Indid or Arabo-Afghanid wing includes mostly the Arabid, Irano-Afghanid, and elements of the Turanid, with some Levantoid and Australoid substrate. Caucasoids, such as Georgians and Armenians, might be considered a central, possibly root population found between the Alpinid in Europe and the Turanid in Western Asia, and are often considered to be Indo-Europoids. The languages of these peoples, like these peoples themselves, have converged over time, leading to various groupings oftentimes containing but not being limited to familial relationships, patterned according to some dominant meta-structures arising from out of competing conventions. The larger grouping of these peoples and their languages is that of the Nostratic.

Less commonly, though not incorrectly, various Mongoloid populations might be considered to be a part of the white race. Indeed, Northern Mongoloids, as well as many Austroasiatic peoples, share with Europoids light colored skin. And, indeed, the language grouping in which the Sino-Tibetan and Austric languages fall, the Dene-Daic, shares relations with the North Caucasian languages, such that the term *Sino-Caucasian*, a branch of Dene-Daic, leaves us to conclude that at least one strand of input into Mongoloids shares relations with Caucasoids.[607] Still, even the Southerly Mongoloids, sometimes called *paleo-Mongoloids*, might share some relation to the "pseudo-Mediterranoid" Austroasiatic speakers. Whether Caucasoid or Mediterranoid, the connections of both South and North Mongloid phenotypes to the larger Indo-Eurafricanoid are hard to ignore, involving much hybridization as well as drift over time.

---

603 *Leucism*, or *Leukism*, meaning "white" or "light," is a related condition to albinism. Like albinism, it results in depigmentation of an animal. Because there are many overlaps between leucism and albinism, the lines between these can be blurred. And the two are quite often mistaken for one another. For the sake of this work, *albinism* includes leucism and related depigmenting conditions more generally.

604 Including here Gaunches of the Canary Islands

605 With some Mongoids from out of East Asia and Siberia thrown in for good measure

606 Such as Cro-Magnoid, Mechtoid, Australoid, Capoid, etc.

607 Likely the strand that Carroll Quigley points to, having taken their agglutinative languages to Northeast Asia and into the Americas, discussed later

That Africans in the Levant contributed to the "white race" is a possibility too likely to ignore. Coming "Out of Africa," or perhaps being forced out, African albinos (Capoid, Levantoid) would converge with other albinos in the Levant, the Caucasus, and the Zagros Mountains, to name a few hot spots. One author, in "The Real History of White People," writes that "[t]he second Out of Africa (OOA) migration event (The first being Humans to Australia), saw Blacks from Africa with straight hair and 'Mongol features' take an 'Inland route' through Southern Asia and on up to China, where they settled."[608] This author is a proponent of the Out of Africa view, and so believes that all humans originated in Africa. This view is also called *monogenetic*, because it implies a common origin from Africa for all people, typically from out of a single pair of people or a small population. There is plenty of evidence for this view, and it cannot be denied that there have been migrations from Out of Africa. However, according to a polygenetic view, such as the multiregional view, these African populations had likely combined with peoples who had evolved indigenously in Asia, wherefrom some of their features would come, and to which they would contribute some of their own.

"Included with this group," says the author, "were straight haired Blacks 'without' Mongol features—now called 'Dravidians' who stayed close to Africa, and settled in India and other areas of Southern Asia."[609] Dravidians are a very dark-skinned, black people that exists today primarily in India, though they were probably much more spread out at one time. They are likely some kind of transition or convergence from out of a more pure Australoid type toward a later Jat type, an Indian people discussed later, involving some admixture with Cro-Magnoids from Europe. They are noted for their having essentially Indo-Eurafricanoid features despite their being black.

The author continues, saying that they had been followed Out of Africa by "[a]lbinos, who were probably motivated by a quest for relief from the heat and burning Sunshine of Southern Africa—and relief from the torment heaped upon them by normal Africans. Even today," the author says, "superstitious Blacks of Southern Africa maim and mutilate Albinos in the ignorant belief that their body parts possess magical properties, which they use in rituals."[610] Southern Africa tends to be inhabited today by Capoids, or Khoisan people. These are some of the earliest *Homo sapiens*, or at least are some of the oldest existing humans. Populations would not only come from directly Out of Africa or even from Out of America, however. They'd certainly also involve migrations also from out of the Indies, such as India and Indonesia. The author, himself holding to the Out of Africa idea, continues, saying that "[t]he Albinos [...] found a pass through the Hindu Kush mountain range, now called *The Khyber Pass* they passed through it, and entered the grasslands (Steppes) of Central Asia, where they settled."[611] These individuals would contribute toward groups later known as the *Yuehzi* and the *Tocharians* of the Tarim Basin.

Similar in some respects, John Moore maintains, in "The Origin of the White Race," that "albinos were also called *'moon children'* because they had to avoid being exposed to excessive direct sunlight, therefor they usually only came outdoors during the night."[612] He says,

> Black parents, unable to explain why white skinned children would appear in their offspring became suspicious, and believed that albinism was a punishment from God and the child with albinism cursed or was an embodiment of sin, so they began separating the growing number of white skinned offspring from the natural black

[612] Moore

> skinned population. Those with albinism were either banished or thrown out of the tribes and forced to live in colonies in much the same way that people with leprosy were forced to live in leper colonies away from normal people.[613]

Indeed, white skin has even been considered to literally be leprosy. The root of *albino* is *alb*, which, according to Etymology Online, is related to Greek *alphos*, which means "white leprosy."[614] It may be that albinos had been confused for lepers, but there may simply have been a prejudice against white skin. Most likely, a number of interpretations of the occurrence would lead to separate outcomes, sometimes convergent.

Another possible role of the albinos, or "moon children," sometimes called *children of the night*, may have been as nightwatchmen. This suggests at least some possibility that the modern question of "Who watches the nightwatchman?" may have contributed toward some foul play, perhaps contributing to the concerns of the community about lighter-skinned members who wished to monopolize the nightwatchman role. The "moon children" would become the founders of Thracian, Dacian, Scythian, and Germanic mythologies surrounding figures such as what we now know as *werewolves* and *vampires*. While occurring in Europe, this may have had its beginnings among dark-skinned ancestors of the Na-Dene and Uto-Aztecan-speaking tribes of America, and it may have been brought to Eurasia by way of Beringia. The Navajo, for instance, have legends of shape-shifting witches that turn themselves into animals, such as with the "Skin-Walker," the opposite of a "medicine man," and a Trickster like the Coyote. Having been called "*Homo nocturnus*" by Linaeus, suggests Osten Bjornberg in "Total Albinos Among the Cuna Indians," the Cuna being a tribe particularly stricken with albinism, they have "at times been regarded as monsters" and "have often been killed.""Frequently they withdraw from association with the other Indians and become asocial recluses," Bjornberg suggests, but "'white' Indians have also been regarded as superhuman, associating with the gods and having their own heaven, which normally pigmented Indians could not enter."[615] Other tribes beside the Cuna[616] who are prolific in albinism include the Hopi, Zuni, Jemez, and others of a Pueblid phenotype.

Albinos would coalesce independently and separately in different areas, forming different tribes, and finding success especially in mountainous forest or cold regions where their skin would serve as a positive adaptation or at least a non-deleterious one. They might be found generally in the Levant, as refugees from Africa, but the Caucasus, wherein they mixed with Neanderthal—becoming the Caucasoid race—, would be their stronghold. They would certainly spread out from there as well as converge in other places, such as the Zagros Mountains and the Hindu Kush, but the Caucasus appear to be a central point of white convergence as well as emanation. John Moore says that "albino groups moved into the Caucasus, an area of mountain ranges, plateus, and forests during the Ice Age that lasted for thousands of years [...]"[617] In such a place as the Caucasus, this would likely involve a convergence of Cro-Magnoid, Mechtoid, Capoid, Levantoid, Australoid, and even Americanoid populations, along with a fair amount of Neanderthaloids too. In this way, "white people" are actually a mixture of most, if not all, of the races of the world, but particularly those with recessive traits such as albinism and blue eyes, which in the deep past had either been demonized or deified. White people would converge all along the mountains, in the Hindu Kush, the Zagros, the Caucasus, the Alps, and the Ural and Altai mountains, among others. Perhaps tying it all together was the Alpine-Himalayan Volcano Belt that extends from Indonesia, up into the Himalayas and Southern Siberia, back down through the Zagros and Taurus

---

[617] Moore

Mountains, and across the North Mediterranean. White Eurostanoids, if this is the case, may trace their ethnogenesis to the convergence of albinids from different races along this belt, the Caucasus, and the Ural and Altai mountains, perhaps first giving rise to the Alpinid variety of white or "white" (ruddy, olive, golden, etc.) Caucasoid, proto-Turanids having split with or separately hybridized from the proto-Alpine and going on to develop into Turanids and Mongoloids. However, some hold that before the Alpinid, a true white, there were others, such as the Mediterranoid or Polynesid, who would start to lighten up first, though not quite reaching a pale, fair, or even ruddy complexion.[618]

It seems likely that albinism was not widespread enough to create pale people in any lasting quantity at first. Rather, partial albinism was likely to be frequent and those albinos that were pale would mix with non-albinos who were available and willing to be mixed with. Partial albinism would come in the form of only lightened, but not whitened, skin tones, as well as "splotchy" or "patchy" skin, with giant freckle-like areas and lighter-skin areas. As time went on, however, skin would lighten and patches would shrink in size into freckles, producing people of a "fair" or pale skin-tone, sometimes even absent of freckles. This would especially be the case with later Caucasoid and Nordid types, as well as the Northern variant of Mongoloid, a partial derivative of the proto-Turanid.

Among the first "white people"—probably only slightly lightened, or "partially albinized"— may have been the various mountain peoples[619] who would become known variously as *Gutes*, *Juts*, *Gutians*, *Jats*, *Tats*, *Zatts*, and etc., developing largely from out of the Zarzian culture, probably a mixture of Australoids, Cro-Magnoids, and Neanderthals, perhaps including some proto-Turanids, in the Zagros region; and *Alpines*, *Albani*, or various other names, typically coming from out of Natufian influences as "Basal Eurasians"— Levantoid, Mechtoid, Cro-Magnoid, and Capoid admixture— mixed with Lappoids or Turanids and Neanderthal. Like the Natufians, who were a related Mechtoid, Levantoid, and Capoid culture developing toward a Eurafricanoid phenotype[620] in the Levant, the Zarzians, had, taking after the Kebaran people, similarly composed to the Natufians, participated in an early form of horticulture. The Kebaran had ultimately synthesized the Mechtoid Aterian, the Levantoid Emiran, and the Capoid Bohunician cultures, though there are also similar microliths to the Kebarans found in East Asia. Both Zarzian and Natufian stone industries developed in part from the Kebaran. Zarzians and Natufians represent members of the two major wings of the Borean languages, Dene-Daic and Nostratic, perhaps in their prototypical or ancient forms. Over time, the Late Stone Age process of coalescing albinos contributed further to what would become known variously in the Bronze and Iron Ages as *Hebrew*, *Aryan*,[621] *Scythian*, *Tartar*, *Hun*, or etc. groups— collectively referred to as *steppe peoples*— largely by way of the *Yamnaya*, or *Yamna*, perhaps the central locus of the Indo-European peoples, and themselves likely having taken to the Pontic Steppes after having adapted first to the Caucasus or having mixed with Caucasoids. These peoples were a good mixture of basically all of the races and had developed toward Pontid and Turanid phenotypes, which would mature much later into Nordid and Turkid phenotypes.

Blushing in a social manner, turning one's cheeks on one's face red for all to see, is an unpleasant genetic advantage that lighter-skinned people, such as albinos, seem to have over others, even when of the same race. Blushing occurs when something shameful or embarassing is happening or has occurred, typically as a result of the blushing individual's behavior, causing embarrassment or guilt. This includes

[618] A portion of the Mediterranoid race, related to the Minoans and Phoenicians, would come from India and up through the Pontic Sea

[619] *Ghat*, too, and for instance, also means "mountain"

[620] Essentially the substrate to what would become, through admixture with later Cro-Magnoids, Basal Eurasians

[621] Herodotus says that the word *Aryan* or *Arian* comes from the Medes, and suggests that they are all *Magi*, "mages," "magicians." *The Encyclopedia of Indo-European Culture* says that *Aryan* means "Freeman."

when someone does something shameful like lying, causing the individual to blush and, if their skin is light, to give away their secret (so long as they have not learned to lie with a skill, as by using half-truths or distorting the meaning of words using performative language). While a detriment to the immediate desires of an individual, perhaps, blushing is nonetheless a benefit to the individual's society, and thereby indirectly to the individual. Darwin had called blushing, in *The Expression of the Emotions in Man and Animals*, "the most peculiar and the most human of all expressions."[622] It may be an example of group selection, traits that are selected not because they are of direct benefit to an individual, but because of their benefit to the group.[623] John Farrier posts, in "Why We Blush: An Evolutionary Explanation," a quote by Jesse Bering from *The Scientific American* wherein he says that

> Given the possibility of being deceived, it would have been rather foolish of our ancestors to take at face value a person's verbal or behavioral expressions of remorse. Instead, over tens of thousands of years, uncontrollable blushing would have evolved as a fairly reliable predictor of the actor's future behavior. In other words, if the behavior or the situation at issue made the person feel so uncomfortable that his or her facial veins dilated— a psychological response that for many people is attended by a somewhat unpleasant tingling sensation— the blusher would probably avoid repeating that behavior in the future.[624]

In quite a similar fashion, Leslie Nemo speaks of blushing as demonstrating "reliable sincerity," in "There's an Evolutionary Advantage to Blushing." She says, citing Chris Thorstenson, that

> Collaboration requires trust. If trust is broken, riffs might be mended when someone shows they regret their actions. Blushing might signal authenticity the way other mannerisms can't. When someone apologizes, Thorstenson points out, they can mimic the facial expressions we associate with embarrassment. But blushing happens involuntarily.[625]

If one who is prone to blushing goes about a misdeed, the individual will have a difficult time getting away with the misdeed, and this is learned by blushers early on in life around one's peers and family. Perhaps it is called *fair-skinned* because fair people, or people who have traditionally been considered to be just, have been associated with it. Indeed, to avoid blushing, many take to being honorable and true. This sentiment shows when Charles Darwin passes on a quote from a Spaniard, who said "How can those be trusted, who know not how to blush?"[626] The difference between blushing in albinos and otherwise dark races was noted by Darwin himself, when he said that

> The small vessels of the face become filled with blood, from the emotion of shame, in almost all the races of man, though in the very dark races no distinct change of colour can be perceived. Blushing is evident in all the Aryan nations in Europe, and to a certain extent to those of India.

---

[622] Darwin

[623] Heroism is an example of group selection. Oftentimes, heroes die in their pursuits to help others. So how are these genes passed on? While the individual hero may die, their heroism is likely to benefit their families and societies in such a way that the genetics being widespread serve to benefit the genes overall. In this way, too, group selection is not necessarily antagonistic to, but may be an expression of, the "selfish gene" idea. So long as genes survive in natural selection, they are considered to be successful.

[624] Farrier

[625] Nemo

[626] Darwin

Nonetheless, Darwin said that "facts now given are sufficient to show that blushing, whether or not there is any change of colour, is common to most, probably to all, of the races of man."[627] Blushing is something that all humans do, but it isn't something that all humans exhibit readily or communicate socially to others. Darwin, again for instance, said,

> That the capillaries of the face in the negro become filled with blood, under the emotion of shame, we may feel confident; because a perfectly characterized albino negress [...] showed a faint tinge of crimson on her cheeks when she exhibited herself naked.[628]

It is fair to say, then, that all of the races of *Homo sapiens* feel shame and as a result blush, but that this is more easily signaled to others when one's skin is of a lighter shade. Farrier says that "blushing seems to be an appeasement display."[629] Chimpanzees do not blush, though they do appease with a grin, which is sometimes called *blushing* despite its not being a human equivalent. Humans of all races appease also. Farrier also relays that Mark Changizi "claims that our species' unsually strong color vision evolved so that we could detect subtle hue changes in other people's skin, thereby deducing their emotions."[630] That's a very powerful role for blushing to play, if true.

The importance of blushing should not be understated. The blushing of fairer-toned people has applied pressures from within white society to tell the truth, which had allowed whites especially—not to be confused with Europeans, but including albinos and fair-skinned people of all kinds— to develop a more honest and dependable culture. Originally a mutation that was likely seen as a bane— to the first one to blush—, blushing was favorably selected by nature because of the group benefits it offered.[631] The people who had started openly blushing through albinism are likely also to have developed the first well-established villages and civilizations in places such as India, Canaan, Mesopotamia, Egypt, and Europe,[632] taking us from out of the Stone and Copper Ages.

The Biblical *Adam*, possibly a tribe named after a patriarch or a totemic idea, was, according to some knowledgeable scholars, the first to be identified with blushing, though it may refer to being red for another reason. Josiah Nott, for instance, believed that *Adam* referred to "red in the face" or "blushing," and so that Adamites had to have been white people set apart from others.[633] Bertrand Comparet, for another instance, says, in "Adam Was Not the First Man," that the "Hebrew word *aw-dawm*, rendered *Adam* in English, is from a root word meaning to show blood in the face or of a ruddy complexion, a word obviously not applicable to the dark races, which we also know from scientific evidence to be much older than the white race."[634] Today, *Adam* is widely defined as "a person" or "a man" or "mankind." Many tribal peoples still alive today go by local names that, to them, simply mean "people," delineating them from others considered to be in the animal realm. Because I tend to the view that *The*

[629] Farrier
[630] Farrier
[631] Perhaps being a result of *group selection*, a concept that was promoted by V.C. Wynne-Edwards and Konrad Lorenz, later revived by David Sloan Wilson and E.O. Wilson
[632] Of course, many thinkers hold that the first widespread inter-cultural society was established by black people of some relation to Cushites, Elamites, Dravidians, and related peoples, which may be the case, but these would not have been agricultural civilizations so much as fishing and proto-maritime villages, until the spread of advanced horticulture from out of the Levant. Whether these Basal Europeans, in this stage, were albino or not is unknown, but is likely considering the trail of albinism they would leave behind in Europe, as indicated by tribal names and placemarkers.
[633] Though he was certainly not an avid defender of *The Bible*, often calling into question its statements
[634] Comparet[1]

Bible provides a genealogy of the ruling class, which I do believe to be white supremacist and also stated largely in earnest for the sake of posterity, I believe that Comparet's racial interpretation of the text is probably accurate. And from a secular position of evolution, blushing and albinism do appear to have some competitive advantages that might lead to the establishment of a ruling class during more barbaric times, leaving a residue that still persists today. If there is a "master race" among humans,[635] it is not owed to greater strength or intelligence, or even necessarily to any particular inner virtue, but to the capacity to socially blush, which has bestowed benefits beyond the individual, allowing for greater group cohesion through trust and a reduction of dishonesty, thereby ushering in the white ruling classes of the Bronze and Iron Ages, the "nobility," elements of which still persist today.

Unfortunately, methods have been developed to get around the biological response of blushing, among them performative utterances. *Performative utterances* are— according to Wikipedia, and following the thought of people such as J.L. Austin, John R. Searle, Kent Bach, and Robert Harnish— "sentences which not only describe a given reality, but change the social reality they are describing."[636] When it comes to performatives, the statements make the state of affairs. Saying it "makes" it so. These are "words as actions," magical *speech acts*. Performative utterances are transformative statements because they result in changes of the social environment.

An example of a performative utterance would be a statement like "I promise," which is nether true nor false, but is a projection or statement of hope. A *promise* is a statement of commitment to an action or to refraint from an action as an assurance of particular ends to another person. It is a kind of performative utterance or magical incantation used to achieve the trust of a person to manifest a result. Nonetheless, when promises are kept, and are considered dependable, they may become particularly important bases for human actions, such that, really, complex social structures are ultimately built upon promises. Promises may come in the form of pledges, oaths, vows, affirmations, and so-on, a particularly important form of which is the *contract*, the documentation of promises in the form of the privileges and duties of the involved parties, typically involving writing and signatures. Breaking promises, whether in the form of a simple agreement, or in the form of a ritually-established or written contract, is generally considered to be both immoral and unethical, and sometimes even taboo or unlawful, and so a cause for consequence.[637]

Another kind of performative utterance might be "I now pronounce you Husband and Wife." Another is "this meeting is adjourned," or "bye." These are statements that have the effect of changing the social environment of belief or relation. Another example, related to getting around blushing, might be an affirmation and acceptance of the statement of a liar, who would otherwise not be believed. James W. Pennebaker, in "The Language of Truth and Lies: Performatives," for instance, tells us that this happens quite often, especially with politicians. He explains that

> when people tell the truth they tend to use words like *I*, *me*, and *my* at higher rates than when they are lying, except under one circumstance [...] first studied by

[635] Left- and Right-wing alike tend to agree that existing ruling class tend to be composed of white people, but differ on the specifics, such as regarding Anglo-Saxons, Nordics, Jews, Turanids, and other peoples often considered to be white, including fair-skinned Mongoloids

[636] Wikipedia[1]

[637] Broken promises break down trust, such that future promises will not be considered to be of any worth, while broken contracts, or *breeched* contracts, can lead to legal *suits*, hearings by courts who rule on matter. Without such a contract, legal offenses between parties are considered matters of *tort*, rights and obligations as established by the court rather than by the contract. Broken pledges, oaths, vows, affirmations, and etc., often being treated as vocal contracts established by witnesses in rituals, may also carry normative consequences, sometimes as serious as death, banishment, expulsion, shunning, shaming, and so on.

> philosophers, and specifically a man by the name of John Austin. Austin studied something called *performatives*. An example of this would be [while holding a pen in the video], "I want you to know I am holding a shovel." Now, in reality, this is not a shovel, but nonetheless, what I just said, was it true or not? "I want you to know I am holding a shovel." In a weird kind of way, that's true. Why? Because the first part of that sentence, "I want you to know," is true. I really do want you to know I am holding a shovel. Now, "I am holding a shovel" is completely false, but that's not the premise of the sentence.[638]

In this way, performative utterances can be used to avoid blushing, allowing a skilled practitioner, even if very pale, to limit their biological signaling to others about having just told a lie.[639] To a certain degree, the use of performatives by elite albinos to lie while telling the truth has decreased the biological advantage of albinism, to the detriment of albinos everywhere.

A similar concept to a *performative utterance* is the *self-fulfilling prophecy* described by Robert K. Merton, who says that it occurs when an otherwise false statement inspires a new mannerism that leads to the false statement becoming true.

Mediterranoids

Human evolution takes place within the geological context of an expanding Earth, wherein the Ibero-Africa, Central America, and Oceania are nearby, if not touching. The Mediterranoid,[640] in common with earlier *habilis* and *floresisensis*, appears to have multiple points of origin, owing to the growth of the Earth, which had divided the continents from one another, and thereby also the major branches of the Mediterranoid, which do seem to have kept some contact when they could. As time went on, relations were harder to maintain between these separated populations. However, there does appear to have been some contact maintained by the people who would come to be known collectively as *Mediterranoids*. Michael Bradley says that the "combination of moderate Cro-Magnon physical features, many Saan traits and a few Neanderthal physical characteristics resulted in a mixed 'Upper Paleolithic' or 'Early Post-Glacial' people of the West who have sometimes been called the 'Mediterranean Race.'" [641] Bradley holds that a flooding of the Black Sea caused a drastic outward expansion of Neanderthal-admixed Caucasoids, from which he sees the Mediterranoid race as largely being derived from.[642]

More than any other race, however, except perhaps the Alpine and Nordid derived from them, the Mediterranoid race has been influenced by successive waves of migration from other peoples and from their own exploits, itself changing form throughout the years, from a more Mechtoid-type phenotype to the form taken today in the modern Mediterranoid, itself a Cro-Magnoid and Mechtoid foundation that has been mixed with Levantoid and Australoid albinos from sub-Saharan Africa and India, and islanders as explored later on. As such, Mediterranoid might be considered to be the most fluctuating of the races, perhaps starting with its prototypical form, the proto-Caucasoid Natufian. The development of lighter-skinned Eurasians— possibly beginning with Cro-Magnoid but certainly exacerbated by Levantoid and Capoid albinos from Africa, Australoid albinos from India and Indonesia, ancient Polynesians, and perhaps paleo-Amerindian albinos as well— would begin the process of

[641] Bradley[1]
[642] See Bradley[1]

Mediterraneanization and Noridicization, and would initiate the Levantian superstrate to the proto-Mediterranoid race. The Mediterranoid is typified by having olive to brown skin though it can be very dark, dark brown to black hair, and grey or brown to sometimes black eyes.

The evolutionary home of the Mechtoid and the Capoid races have been traced to the home of the Mediterranoid, as Coon suggested, in Ibero-Maurusia, from which Mediterranoid spread around the Mediterranean and throughout Western and Southern Eurasia as a whole. The Capoid race would evolve in a Green Sahara, most likely from Rhodesian Man. Capoids have since taken toward Eurasia and South Africa, being replaced in North Africa by Mediterranoids after a change of climate. The *Mechtoid*, or proto-Berber race, would evolve in North Africa, Iberomaurusia, or Eurafrica (as Spain and North Africa had been connecte), probably from a mixture between Cro-Magnoid people, or early Europeans, and various populations in Africa, mostly Capoid and possibly Levantoid, in a manner similar to Berber people themselves having mixtures of both Congoids and Mediterranoids. Northern Africa, above the Sahara, is considered separately from the rest of Africa due to its connection to the developments in Eurasia during times of a barren climate. As such, Northern Africa is considered a Mediterranean zone, largely populated and influenced by Berber and Mediterranoid peoples, themselves having maintained connections to Europe as a part of the larger zone of Eurafrica.[643]

Capoid and Mechtoid may have been some of, if not the original, inhabitant of the legendary city of Atlantis. Perhaps a testament to the connection between Africa and the Americas, or Atlantis and Lemuria, if you will, is that the Aterian points of Iberomaurusia look very similar to paleo-Amerindian Lithic points, perhaps also suggesting that *Homo rhodensiensis*, "Rhodesian Man," or possibly a derived Capoid had made a few journeys from Atlantis to the Americas, or "Lemuria." The Naia Skull, that of a woman in Yucatan, has been forensically-reconstructed by a team, resulting in a figure who appears to have some phenotypic relation to Capoids. This might be suggestive of a trade relationship or a point of connection between Yucatan and Atlantis, perhaps a Capoid visitor from Mauretania who met their fate on their journey to Central America, where they may have also contributed some genetics toward the people there. In such a case, a proto-Mechtoid may have been making a journey already well-known to Capoids, perhaps even to *Homo rhodensiensis* or even *Homo antecessor*. Rhodesian Man, from Mauretania, likely ancestral to Capoid and developer of the Aterian industry, strangely has an "Inca Bone." Mechtoid had powerful jaws and a flat face approaching that of Otamid, with a slight brow ridge, slightly sloping forehead, and Roman nose as well. In "Did the Denisovans Become the Legendary Giants in the Indian Mounds of the USA?," Terje Dahl makes the case that the Denisovans were the legendary giants and wildmen described in the tales of the American Indians, that they were of some relation to the Otamids, and that this is being covered up by the Smithsonian Institute.[644] It seems that, if this is the case, *Homo antecessor* had somehow made it into Asia, becoming Denisovan, that Denisovan may have traveled to New Guinea and then sailed to Texas, becoming Otamid, and then to Mauretania to become Mechtoid. If there are more native origins to Denisovan, it might suggest that *Homo antecessor* had itself come originally from Out of America before returning home as Denisovan.

The Mechta-Afalou skull, for which the Mechtoid is named, is missing its front teeth. One reconstruction shows Mechta-Afalou with extreme body modifications or piercings, spikes sticking out from different areas of the face, which might suggest that the teeth were removed for ritualistic purposes, perhaps as a sort of sacrifice, a practice called *tooth ablation* that is well-documented in

[643] Perhaps the most significant civilizations of North Africa were the Egyptians and the Phoenicians, whose maritime colonies spread across the North of the continent and into Iberomaurusia
[644] See Dahl[2]

North Africa, the origins unknown.[645] The Meso-American cultures are well-known to be obsessed with the idea of sacrifice, developing a culture largely centered around human and self-sacrifice, including practices of trepanation and cranial deformation. So teeth removal, or *tooth ablation*, as has been seen in Mechtoid, and while not a common practice in the Americas, could be a sign of this culture having made its way from the Americas to Atlantis in Africa, and expressing itself in a new way. A possibility for the origins of this practice might be to remove teeth arising from *ectopic eruption* or *hyperdontia*, the appearance of double rows or odd placement of teeth, as are found in Otamids.

Atlantis has been discovered by the independent researcher, Jimmy Corsetti of Bright Insight. He places it in Mauritania, near Morocco, in the "Eye of the Sahara," or "Richat Structure," citing evidence from the Ancient Greek historian Herodotus's map. Mauretania has landmarks such as the Atlas Mountains, and the first king of Mauritania was named *Atlas*. It is interesting that the mythical—now, legendary— Atlantis was built atop a natural feature, resulting from geological activity. The *Eye of the Sahara* is a mud dome that had formed from the bubbling up of the earth in that area, and had rings of water around it. This may have made Atlantis a particularly comfortable habitation, especially for people who had remained close to the location of *Homogenesis*, should that have truly taken place in the atolls of the South Pacific and North Indian oceans as Buckminster Fuller suggests. It must not be forgotten that, on a much smaller Earth, Atlantis would not have been far at all from this heartland.

Some have suggested that ancient societies, such as those of Atlantis, had acquired the use of electricity, and that this explains the great accomplishments of ancient civilizations, perhaps even as late as the Seven Wonders of the Ancient World, including the ancient pyramids, which some antiquarians suggest are much more ancient than usually agreed upon in the academies. Frank Alper, in Catherine Bowman's *Crystal Awareness*, for instance, tells us that

> Crystals have been used on Earth for over 80,000 years. They were the source of power in the ancient civilizations of Lemuria and Atlantis. They were used as conductors of energy information from the civilizations to other forms of conscious expression of life.
>
> Realizing that geometrics was the language of the Universe (it is without distortion), the Atlanteans developed patterns that created numerous forcefields of energy to serve a wide spectrum of needs.
>
> [...]
>
> The energies are real. We have used them in radios, watches, computers, and many other instruments available to us at this time.[646]

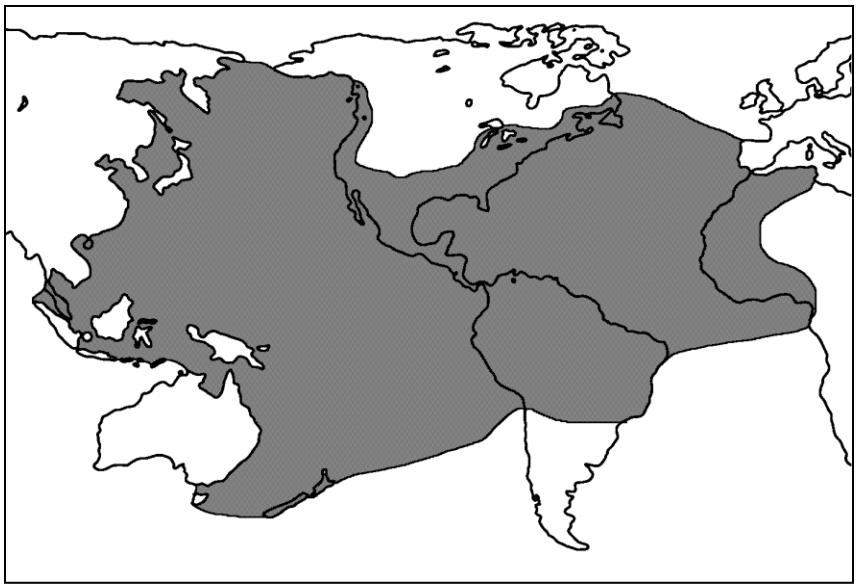
This reflects many of the attitudes of peoples, at least as relayed through myth. Could this also, perhaps, have something to do with the Denisovans' fine jewelry, which appears to require rotary motion otherwise unbeknownst at their time? This jewelry is, afterall, composed of serpentine stone, such as that found in volcanic vents, which can be quite magnetic. Did Denisovan discover the powers of polarity, and somehow cause the spinning necessary to bore holes and even carve rings? Is there a connection between the serpentine stone and snake motifs throughout religion?

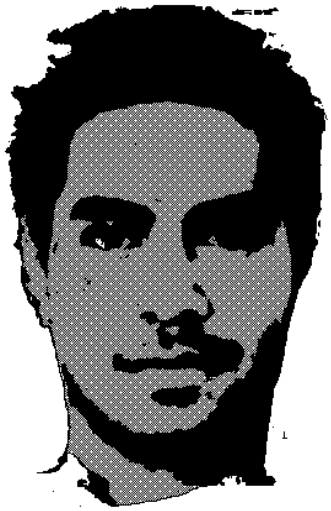
---

[645] In Australian Aborigines it is sometimes associated with moiety arrangements. Among the New Hebrides of Vanuatu, incisors are removed from women upon marriage. Vanuatu also has cannibalism, as depicted by Charles E. Gordon Frazer. The Amelbati were a Vanuatan cannibal tribe, part of the Nambas clan. A *nambas* is a penish sheath. On Vanuatu, only 28 lineages have a right to eat human flesh.

[646] Bowman

Mauretania is also the home of the Moorish or Berber people. Atlantis would likely have been a proto-maritime fishing and trading society, perhaps even connecting trade between the Americas, Eurasia, and the Indies. The Ancient Romans called the Berber people "*Mauri*" people. There is also a people known as *Maori* on the islands of New Zealand and the Cooks Islands. Anthropologists have also noted such a similarity between Maori and Maori-like people— Polynesians living in the Pacific Ocean— to Mediterranoids, that some anthropologists, such as Giuffrida-Ruggeri, referred to some of these Pacific Islanders' phenotype as "*pseudo-Mediterranid*,"[647] meaning "false Mediterranean." The site, referring to the phenotype as "*Nesiotid*," (after the Greek League of the Islanders) also cites Sullivan as suggesting it is "a gracile Europiform." Bertil Lundman categorized Nesiotids as true Mediterranoids. This phenotype is shown going from small populations along the coast of Japan, Southeast Asia, Indo-Oceania, New Zealand, and out to Hawaii and Easter Island, a coverage basically consistent with Polynesians. The Maori— says the Stewart Island Promotation Association, in "History and Naming of Stewart Island"— have a word for blushing, *Rakirua*, which refers to the "great and deep blushing" of Chief Te Rakitamau, related with sunsets and sunrises and the Southern Lights.[648] Polynesian genetics as well as trade goods have been demonstrated in South America[649] perhaps as a result of visitation by Pacific Islanders. My suggestion is that ancient Polynesians, or Nesiotids, and Mechtoids have some sort of relationship.





Polynesians of the "pseudo-Mediterranoid" variety are typically traced back to what is called the *Austronesian expansion*, an expansion of Austronesian (Dene-Daic, Austric) languages that took place from out of the Phillipines, a *Neolithic*, or "New Stone Age," people referred to indirectly as the *Lapita culture*. Being from the Phillipines, it is not unlikely that there would be some remnants of *Homo luzonensis* ancestry involved in the expansion of the Lapita peoples. These peoples married some of the Papuans of Melanesia as well. However, the Lapita-led Austronesian and Austro-Malaysian expansion

[647] N/A[2]

[648] See Stewart Island Promotion Association

[649] Which may have had not just an Amazon River, at the time, but an Amazon Sea, owing to the high waters of the warm period. This may have allowed for a quick journey across South America, with beaches available for resting and stocking up on food. Perhaps the Polynesians and Capoid people have a similarity in phenotype owing to ancient maritime connections. Capoid people, according to Coon, had evolved in Northwest Africa, near what others suggest as the location of Atlantis. Indeed, some researchers such as Augustus Le Plongeon have suggested that the Egyptians had received their culture from the Mayans, or more specifically the Naacal. This might explain why Ancient Egyptians, such as the sarcophagus of King Tut, at times appear to be Polynesian.

likely represents a later wave of Malay and Polynesian peoples than those associated with Mu, perhaps inspired to find their homeland of Mu after some settling of the seas. This expansion, nonetheless, is often associated with the development of major aspects of Malaysian, Taiwanese, Phillipine, and Polynesian culture. Tongans—who, interestingly enough, have crown jewels similar to those of European monarchs— are among the nearest to the original Polynesians.[650] However, certain Torriband Islanders may reflect a purer Nesiotid phenotype as well as preserve a unique "grade-taking" system, discussed later.[651] Buckminster Fuller places the expansion of the Austronesian people much earlier than the Neolithic Lapita people, around the time that Cro-Magnoid would have been well-established in Europe. He suggests that some of these Austronesian-derived people had been "blown Westward on rafts" to Somaliland and Arabia, where they would "confront the Westward on-foot or on-camel caravanning of the earliest Egyptian and Mesopotamian civilizations of written history."[652] Fuller attributes all seafaring traditions to these Austronesian island-derived peoples, including that of civilizations in Southeast Asia as well as those in the Mediterranean and beyond, especially highlighting the Phoenicians. Stephen Coombs relays that Stephen Oppenheimer (who poses an earlier Indonesian or perhaps Vanuatan home than the Lapita culture) suggests that *Orientalids*, the almond-eyed people of Western Asia, have ancient Polynesian admixture. The *Cymotrichi*, including Indo-Eurafricanoids, Australoids, and Malays, may have similar origins for their wavy hair. It seems to me that the Nesiotid phenotype developed independently on or around Vanuatu, that it may have been something of an albino Ovejerid (perhaps of relation to a Centralid or Centralid-derived Pacifid that had been banished and forced out to take refuge at sea), or that Fuller is correct about a *Homo sapiens* subspecies having developed in Maritime Southeast Asia and expanded from there, perhaps from some *Homo erectus* relative of *Gigantopithecus*, or from *Homo floresiensis*, or *luzonensis*. This would have occurred before the Lapita-led expansion and may have contributed also to some of the Polynesian influences in the Mediterranean as well as to the development of the Malaysian people.

The early proto-Austrics and proto-Moors, from whom the Mediteranean peoples would develop, would have learned to make the journey across the oceans to visit one another, perhaps crossing a much more sea-like Amazon at the time, contributing toward later Amerindian—such as the Toltec, Olmec, Incan, Mayan, and/or Aztec— societies; and then into Northwest Africa, perhaps contributing to the Otamid, Ovejerid, Capoid, or Mechtoid phenotypes and traveling inland by way of a much larger Nile, which likely included a large lake in the Sahara. This would especially be so if they had learned to follow the equator of the time—probably having deduced that the Earth was round and that such a voyage would take them somewhere— to discover islands such as Easter Island and the Canary Islands. They would then go about constructing sites along the equator, including those of Atlantis and the predecessor of Angkor Wat.[653]

Clearly, the distance between New Zealand and Morocco is vast enough so as to include two oceans and a continent between them. But this cannot be ignored. On a much smaller planet, the coast of Northwest Africa, containing Mauritania and Morocco; and maritime East Asia, Oceania, and the

---

[650] Polynesians have some distinct characteristics that distinguish them from Indo-Eurafricanoids as well as Mongoloids, including a pentagonal-shaped skull that is pointed on top adding to its vault, a sloping forehead, and a large "rocker jaw" with relatively small teeth, being also well-noted for their large size, being both stocky and capable of carrying more bodyfat than is normally healthy for other races.

[651] Which may tell us something of the source of the meritocratic nature of some of the mystery schools

[652] Fuller, 17

[653] While Atlantis would apparently succumb to flooding, before the drying of the Sahara, it would nonetheless be followed by later Berber civilizations. The predecessor of Angkor Wat, however, now in lush jungle instead of sand dunes like Atlantis, would be followed by Angkor Wat in the Iron Age, in the largest and richest city of the time. It was connected to the Buddhist religion and was characterized by extravagant temples and hand-dug waterways.

Pacific Islands, including New Zealand and Hawaii; come together around Panama, such that they are about touching.[654] It may be that in the cycling expansion and contraction of the Earth that these locations had come closer together. Indeed, the Expanding Earth geologist, Roberto Mantovani, had suggested something quite similar. According to Giancarlo Scalera, in "Roberto Mantovani […] and his ideas on the expanding Earth, as revealed by his correspondence and manuscripts," Mantovani had estimated "the rate of separation of the continents, and asserted that Atlantis was nothing but Brazil. 10,000 years earlier," he says, "that country was," in Mantovani's view, "only a few dozen kilometers from Africa."[655] Jonette Crowley and Groeneveld Dekker corroborate this from anthropology when they say, when interviewed in "Legends of the Ancient Ones – Before the Maori Arrived in New Zealand," that the ancestory of the Maori

> dates back to over 12,000 years ago when one of the continents in the world, Hawaiiki, went mostly underwater. Aotearoa, or New Zealand […], was to stay above water and become the "Pulse of the Earth Mother", or Hawaiiki Tautau, Lemuria or Mu in other languages. There were many who lived here then, including the Patupairehe (commonly referred to as the fairy people of NZ but of course being much more than that).
>
> More recent migrations brought Waitaha and later Maori to the land. They have all become one tribe over time, willingly or unwillingly.[656]

Crowley and Dekker promote, further, the idea that the Maori and Ancient Egyptians were tied together by their reverence toward the star Sirius. The map attributed to Herodotus, the father of history, shows Atlantis in Northwest Africa, and the Nile River almost reaching it, stretching Westward in a way that we would not recognize today, and possibly allowing the Egyptians and the Atlanteans to keep strong relations. The *Patupaiarehe* are said to have been white, red- or blonde-haired humans who preceded the Maori in New Zealand. They are said to be nocturnal albinos who cannot come out in the daylight. The Maori word for "white people" is derived from the word for them.

Augustus Le Plongeon had argued in favor of what is called *Mayanism*, the idea that civilization had emanated out from the Maya or, more specifically, proto-Maya, the *Naacal*, who are today associated with speakers of Nahuatl.[657] He had held that the ancient symbols of Freemasonry could be traced to the Maya, and that the Mayans had travelled Eastward, first to Atlantis and on to Egypt. He was opposed by the majority of scientists of his time, but regularly defended his views. His opponents had held that cultural diffusionism was not taking place, but that Egypt had grown natively from its own culture, a view consistent with convergent evolution. James Churchward would revive these ideas, however. Le Plongeon had pointed to Queen Moo, but James Churchward would suggest that the Naacal were the people of *Mu*— a lost continent that he was the first to suggest the existence of, considered discredited— and that the major world civilizations in India, Persia, Babylon, and Egypt were merely the colonial remains of the Naacal civilization. Le Plongeon said that the Naacal had become the Nagas in the East,

---

[654] Such a scenario poses important implications for the Out of America hypothesis, particularly as it relates to the Mediterranoid phenotype. If Australoid were to have had their status reduced to an archaic form of human similar to Neanderthal and Denisovan, perhaps as *Homo australensis* or something to that effect, and if this business about the Mauri and Maori is correct, then the Out of America hypothesis becomes viable not just to the Mediterranoid race, but to *Homo sapiens* at large. In such a case, *Homo sapiens* arises first not in Africa, Europe, or Asia—or else in all of these, united—, but in America, as a mixture of *Homo australensis* and perhaps some relative of Java man, *floresiensis*, or *luzonensis*.

[655] Scalera

[656] Crowley and Dekker

[657] Interestingly, *Nahas* is Hebrew for "snake," similar to *Nahua* as in the Nahuatl, perhaps indicating a reference or shared lexicon

in Burma.[658] The Naacal and the lost continent of Mu are not taken seriously in the mainstream. Indeed, if the seafloor maps prepared by the intelligentsia of the military-educational complex are to be trusted, there appears to be little place for Mu to have gone to. If there was such a continent of Mu, it is likely that it was composed not of now-sunken islands, but of islands that are not currently submerged but that may have been when the sea level was higher, and that these islands had, at one time, been together, pulled apart by the spreading of the seafloor. Of course, it is possible also that Mu had never existed at all. Mu may simply be North America. In the case that these occultists were correct, however, the Mediterranoid race—which may extend between Taiwan around the world through Eurafrica to India— may be in demand of a new moniker; perhaps, if Nesiotid, Ovejerid, or Otamid do not cut it, *Naacaloid* would be most appropriate. But this may really just be an unnecessary renaming of Eickstedt's *Centralid* or *Margid* variety,[659] or perhaps even the *Andid*, without even having a holotype.

Naga, cognate with German *snake*, is that which cannot be perceived by the senses, "gnosis" or "intuition." Nagas value direct judgement over trusting what one is told. The Nagas can be traced all the way to the Naacal in the Americas, but appear in Asia among dark-skinned peoples, perhaps Australoids who had started to deviate toward Dravidians to the West and Mongoloids to the East. To this day, there are very dark-skinned paleo-Mongoloids in Burma, Cambodia, Laos, and surrounding areas, while Dravidians can be found in Southern India. Both of these are derived, at least in part, from Australoid ancestry. The Nagas, however, would form themselves as a ruling elite over the local populations, themselves coming from the Mayans by way of Polynesia. To this day, there are stories of the Nagas who used to occupy Sri Lanka (now occupied by Dravidians and Veddoids) and of the Nagas being snake-like, shapeshifting gods,[660] there remaining in Northeastern India a swastika-using, Poly- or Micronesian-derived Mongoloid or Malaysioid people called the Nagas, known for worshipping snakes and hunting heads. Some of the Nagas would join the Jat Gotras as *Naga Vansch*, using the snake as their emblem. It is likely that much of the esoteric tradition in India and the Himalayas, such as Tantrism, as well as the pre-Vedic Indian religion, including Shivism, is derived from the Nagas, perhaps themselves present in the Indus River Valley Civilization. Naga language was, according to Chan Thomas, in *The Adam and Eve Story*, the predominant language spoken in the Eastern Hemisphere, nearly identical to Mayan, and a progenitor of many languages, including Polynesian, Greek, German, and Yakut. In the Naga language, says the author, water is depicted as a snake (a serpent entwined around the tree represents water covering the whole of the mother continent), alluding to the idea that serpent worship is an allegorical worship of water. According to his view, there are catastrophes every 6,000 years, and the Nagas are the originators of *The Bible*, which tells of multiple creations.[661] It was the snake, the Naga, who told Eve to eat the forbidden fruit. The Naga in India are amazing water workers, being known for their damming of rivers. The Shinasha people, a black Ethiopoid people in Eastern Africa, also called *Nagas*, speak a Naga language and are said by Oscar T. Crosby, in "Notes on a Journey from Zeila to Khartum," to do such things as "claiming great powers of necromancy, by menace of rain or drought, they force the Shankalis to yield up to them a scanty store of grain, or meat, or honey."[662]

Crude map to imagine continents closer together

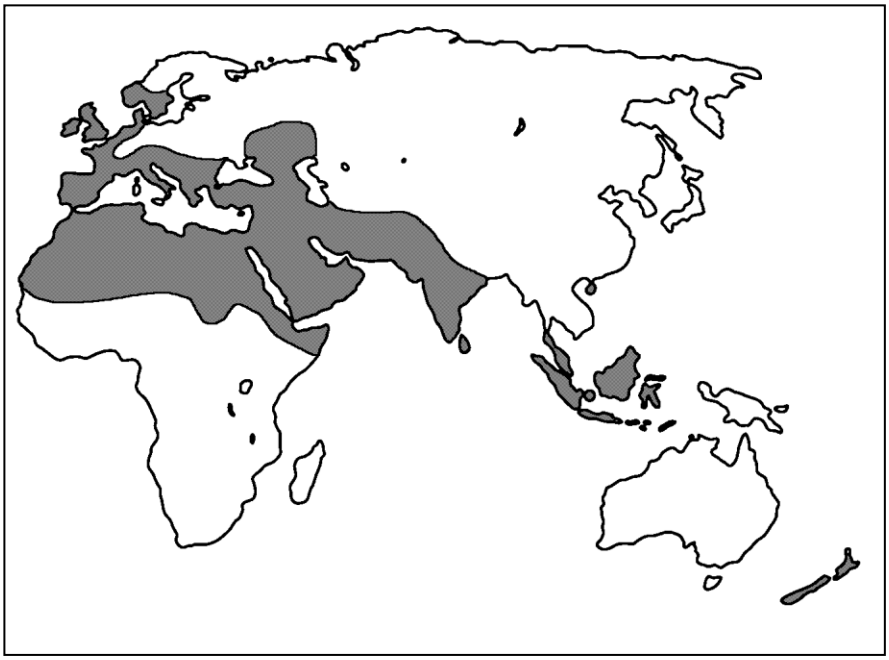
Peru, near where Mauretania would have met the Pacific Islands by Panama, is said to have the fairest-skinned of the South American Indian tribes. Found in Peru are the memories of the *Chachapoya* people or the Chachapoya culture, said to have been tall white people. They lived in round stone houses, similar in some respects to the *brochs*— or round stone building of Scotland—, the stone houses of ancient Celts, or even those of some of the Vikings.[663] These homes were built into the formation of hamlets, also similar to the Celts. The Chachapoya were also found in cliff dwellings, in some respects similar to the Anasazi or Hopi peoples of what is now the Southwestern United States, themselves associated at time with legends of giant white people. The Chachapoya constructed Machu Pichu, the fortress of Kuelap, and a number of other large sites. They constructed megalithic heads similar in some respects to the Easter Islanders, and mummified their dead, especially nobles, whom they placed on cliffsides or in sarcophagi.[664]

Mediterranoids have been variously classified as belonging to a race separate from, and as a branch of, Caucasoid. It may be most appropriate to consider the Mediterranoids, similar to the Levantoids, as proto-Caucasoids or as intermediate to Caucasoid, perhaps with dark-skinned Mediterranoids (having an especially high Levantoid or Australoid substrate), sometimes called *Melanchroi*, being

[663] Sacsayhuaman, or Saksaywaman, is an important citadel site in Peru that Ephraim Squier took interest in and which has a giant eight-mile-long cliff mural, the *Mount Elba* Mural, which Mormon and others interested in the potential Biblical history of the Native Americans have taken an interest in. Is *Sacsayhuaman* some relation to *Saxon*? The site is on Mount Elba, of relation to the *Elbe* River? Something to consider as we move forward.

[664] It is also interesting to note that the Celts, who would not have been too far from Mauretania, maintained stories about fairies. Like the Maori, who have since subsumed the Waitaha into their people, the Celts would have done something similar with the earlier Cro-Magnoid, Mechtoid, and other peoples[664] who would have been related to the Atlanteans, thereby coming into access with their stories, the Celtic ruling class having come, instead, from the East, similar to the later Germans, with the Indo-European expansion. Some have argued for an Irish or British origin for humans or for Aryan peoples. Also of interest is the potential for stories such as the mixture of little people and much larger ones to be conveyed as stories about giants, from the perspective of the "wee folk," as the Irish might say. Could this have something to do with the Nephilim and the "sons of god" and the "daughters of men"? The Nephilim, in such as case, would be the Atlanteans and their associated peoples.

distinguished from Caucasian *Xanthanchroi*,[665] attributed with lighter skin tone, from which the Nordids may have diverged. The Xanthanchroi Mediterranoid was perhaps a co-arrival of the Caucasoid, though some suggest even more ancient. Indo-Europeans, or proto-Nordids (post-Mediterranoids), arose when Eastern Hunter-Gatherers or Ancient North Eurasians, perhaps Capoids with an Ancient North Siberian influence or Lappoids speaking Ural-Altaic, Dene-Daic, or Kartvellian languages, advanced upon Western and Caucasian Hunter-Gatherers mixed with Neolithic farmers, perhaps speaking Caucasian languages, during the Copper Age. Advancing Alpinid farmers had nonetheless divided the proto-Nordids largely from the Mediterranoids that spawned them. The proto-Nordids of the Bronze Age maintained a relationship to the Near East and to Southwestern Asia, wherefrom they back-migrated— perhaps along the Jat Belt— as Germanics and Iranics, and became true Nordids in Northwestern Europe, around the time of the Iron Age, most likely through a process of increasing albinization.



Horticultural and Copper Age Society

Perhaps the first sedentary people on mainland, relying on their horticulture, and so the founders of the *Neolithic Revolution*—the period of time in which people started settling down—, were the Levantoid or proto- or paleo-Caucasoid[666] *Natufians*. They had evolved in the Levant, in the—at the time— Garden of Eden-like setting of Israel. The Natufians had largely come from the earlier Kebaran culture, possibly the *Urheimet* or homeland culture of the Nostratic language family, if one assumes a monocentric genesis for it.[667] Not only were they starting to settle down, they were also raising domesticated dogs and engaging in horticulture and the harvesting of cereals.

---

[665] Thomas Huxley had held that the *Xanthanchroi*, or pale-skinned Indo-European, were the true European race, and that notions regarding *Caucasians* were unfounded. He held that the *Melanchroi*, or the dark-skinned Indo-European and Semite, had been *Xanthanchroi* mixed with Australoid. This is not entirely unreasonable, as Australoid does form a good deal of substrate in Western Asia and was likely also to be found in Europe perhaps especially around the Mediterranean.

[666] Likely phenotype of Skuhl IV and related skulls

[667] The home of the Nostratic languages is suggested to be either in the Levant, among the Kebaran or Natufians, or else near the Caucasus or Zagros mountains, with the Zarzians, proto-Gutians contemporaneous with the

The Natufians likely included among themselves the albinos of the Levantoids, Mechtoids, and Capoids, contributing to a lighter complexion. Coon suggests that the Natufians may even have switched races over time, while maintaining a common Natufian way of life. If albinos, the Natufians had likely been outcast or ostracized. If this is the case, both the external pressures to cooperate and the internal capacity for blushing— a biological adapatation conducive to societal mutualism,[668] which may have began with albinism or some other form of depigmentation— may have contributed to the formation of the first Natufian villages, which brought the world into the *Neolithic* era, or the "New Stone Age." Blushing would not be a requirement of all races moving forward, of course,[669] but it would help, by allowing for contract, to establish the kinds of insights needed to found cultural technologies that could be passed on to other peoples. Perhaps this is what gave the original advantage to the Natufians, the first to really go about establishing villages, their Israeli home perhaps also associated at times with the Garden of Eden, though this is disputed. This advantage would seem to increase as albinism increased, eventually giving way to Aryan, Turanian, and Nordic peoples who arguably compose the ruling class elites of the world.

The Natufians had begun establishing a village society when the the Younger Dryas impact event hit. An asteroid struck in Greenland, moving the Earth into its present condition, with the equator as it is.[670] This may have coincided with or been caused by a pulsation in Earth, or perhaps an ejection as described by Brown's Hydroplate Theory. From the early Natufian village culture, and the spread of villages as far as Japan and the Americas, among the Jomon people and the Amerindians— and following the Younger Dryas, city life would develop, especially in North Africa and the Fertile Crescent areas of Egypt, Anatolia, and Mesopotamia, but also Eastward as far as India, and in the Americas in Central America and Peru, in the Pueblo zone of the North American Southwest, and around the Great Lakes and Mississipi Valleys. Some fringe archaeologists argue that, before the Younger Dryas, there had been more than simple village cultures and hunter-gatherers, and that some of the remains of Gobekli Tepe in Anatolia, Jericho in Canaan, and other sites, often including also the pyramids and megaliths across the world into their claims, speak to this having been the case. As reported by Vicky Verma, in "Massive 12,000-Year-Old Network of Underground Tunnels Stretches from Scotland to Turkey," researchers such as Heinrich Kusch have suggested that there is an entire network of

---

Natufians. From the Nostratic root language or family of languages developed the Afroasiatic (including Semitic, Berber, Egyptian, Omotic, Cushitic, and Chadic) and Eurasiatic (Including the Elamo-Dravidian, Caucasian and Kartvellian, and Indo-European) language families. These two families would distinguish themselves early on. However, the cultural differentiation was likely no more significant than that between branches of, for instance, the Indo-European language family, in that, while they differed, the common heritage between the various groups is likely to have been assumed.

668 Blushing is a mutualistic adaptation to a socially-established niche for honesty, because it communicates, however involuntarily, when one is embarrassed, as when one is ashamed, perhaps from holding back romantic feelings, from lying, or because of some other reason. People who blush are often considered by their peers to be more honest or worthy of forgiveness, because lying is more likely to be caught and obviously regretted, and embarrassment in general may be seen as endearing, with blushing making embarrassment very difficult to hide. The social benefits of blushing are a reduction of advantages to lying, and the personal benefits are the likelihood of being trusted and forgiven.

669 If blushing is a prerequisite of civilization, rather than a stepping stone to jumpstart things along, there is no explanation for the civilizations of the world that have successfully been administered by a dark-skinned ruling class, among them the peoples of Africa, Arabia, India, and South India, perhaps. Some dispute that this has been historically significant.

670Before this, the equator likely ran through Atlantis, Giza, Angkor Wat, Nazca, Easter Island, and a number of other sites, placing the old North Pole in Alaska, as Jimmy suggests (see Jimmy Corsetti). This suggests the existence of an international maritime society that pre-dates the megalithic builders, and whom the megalithic builders may have sprang from or emulated. Mauritania is the home of what was once Atlantis, and Angkor Wat is understood by many fringe archaeologists and anthropologists to have base structures that date back much further than Angkor Wat itself does.

underground tunnels, or "superhighways," that span over a million miles throughout Europe from around the time of the Younger Dryas and going into the Neolithic.[671] Grafton Elliot Smith proposed that the megalithic builders were a part of a *heliolithic* or Sun-worshipping culture that spread megaliths, pyramids, mummification, and etc. throughout the world from a single people, the Egyptians, a position known as *hyperdiffusionism*. He was joined in some of his views by Carl Whiting Bishop. Charles Hapgood, who opposed the Three Age system (Stone, Bronze, Iron ages) of archaeology, believed that hyperdiffusionism took place not from Egypt, but from a superior culture to Egypt that spread worldwide, such as that of Atlantis.

Buckminster Fuller points to another potential location for the beginnings of a global maritime trading network. He says that "Bangcock itself is the prototype of all canal cities developed by later water-people around the world—for example, Venice and Amsterdam."[672] He points out that "sailing-in-the-wind people" who had developed a *Nastika* philosophy of "man being contrary to his God" (on the grounds that sailing into the wind was against God's efforts) had "crossed the Indian Ocean, arriving in Mesopotamia and on the East coast of Africa. From there they travelled overland to the Nile." Indeed, he holds that "all civilization had its origins in the network of maritime interlinkages of early cultures."[673] Of course, before this, people had— and Fuller points this out too— been drifting with the natural ocean currents, and had in this manner effectively had contact with other peoples. Fuller tends to place his dating much earlier than is conventional, but the discovery of Atlantis and its coinciding with other ancient placemarkers, suggesting equatorial settlements of the deep past, might allow for his timeline. The Amazon Sea that existed when the ocean levels were high, and the Nile Sea that would remain for some time as a Nile River extending into West Africa, allowed, also, for the easy retreat from ocean currents (pulling drifters down into the cold waters South of the Cape of Good Hope at the tip of South Africa or the Southern Cone of South America). As the Amazon and Nile seas dried up, they became less accessible shortcuts for ocean-drifting humans, cutting off many worthwhile connections between the Americas and the rest of the world.

The Younger Dryas event drastically reduced the population of humans, who— perhaps like the *Strandloper* Capoids, themselves possibly a relic from Atlantis and the most ancient of the Capoids— took to collecting shellfish along the beach to survive, much as is understood to have occurred during the onset of the Ice Age after the eruption of the Toba Volcano.[674] Population is a major precondition for the maintenance of knowledge and for innovation, a precondition that was disrupted by the impact event, putting people back into a phase of hunting and gathering, before they (re-)developed[675] horticulture.

Western Hunter-Gatherers, or Cro-Magnoids admixed with Capoids and Lappoids, perhaps accompanied by Mechtoids and possibly Nesiotids as well, had made their way into Anatolia, where the offspring of the Natufians met them, from whom they learned how to grow cereal and legume crops,

---

[671] See Verma

[672] Indeed, Fuller traces the later Phoenician maritime culture to this area of the world as well

[673] Fuller, 22

[674] It's interesting to note that the Toba volcano, which set off the Ice Age, erupted in Indonesia, toward which the Australoids would later migrate; while the Greenland impact, which set of the Younger Dryas, was migrated toward by the Mediterranoids

[675] The Amazon rainforest is testament of the positive ecological effects humans can have, likely having resulted from practices of *terra preta* soil-building, perhaps practiced before the onset of one of the ice ages. *Terra preta* soil is self-replenishing, and is understood to have generated a good portion of the jungle, being mined today at a rate that is said not to threaten the rate of self-replenishment. Clear-cutting of the jungle appears to be more of a concern than robbing the *terra preta*.

likely among other things. The Natufians would come to mix with these Western Hunter-Gatherers,[676] and possibly some Nesiotids, forming the East Mediterranean population of Neolithic or Early European Farmers moving up from Anatolia and into Georgia and the Balkans, spreading from there. Levantoids, Cro-Magnoids, and Mechtoids are, along with Capoids and probably Nesiotids, a strong component in these Neolithic farmers, who are racially called *Basal Eurasians*, as they compose the substrate of much of Eurasia, especially around the Levant and Near East. Some of these Basal Eurasians were certainly albinized, perhaps following after the Natufians,[677] but appear to have admixed with dark-skinned Australoids in South Asia giving way to Dravidians, who remained dark.[678] The existence of Basal Eurasians suggests a point from which advanced horticulture would have entered into Europe, however— separate from the introduction of agriculture by Alpinids of the Caucasus—, by a mixture of Iberomaurusian and (probably albinized) Levantoid stock. Whatever the specifics, the Basal Eurasians made their way into Eurasia more generally— exemplified in a group known as the *Beaker People*—, becoming prominent enough to be considered "basal." Basal Eurasian farmers coming out from Anatolia (likely derived from the mixture of Iberomaurusian populations—Mechtoid or Cro-Magnoid—with Levantoids coming from out of Canaan, carrying with them Natufian horticultural practices) had preceded the Alpinid-proper. People of the area were in an exceptionally good place to evolve, because they tended the most to hybridization. Carleton Coon explains it best when he says that

> In zoogeographical terms, Western Asia is a nuclear region because it stands at the crossroads where Africa, Asia, and Europe meet and where three faunal regions, the Oriental, the Ethiopian, and the Palearctic, come in contact. With the cooling and moistening influence of the glacial advances and the warming and drying of the climate during interglacial periods, Western Asia has seen the comings and goings of many animal species [...] There was no better place in the Old World for men to evolve in. [679]

The strength of the Indo-Eurafricanoid, as it turns out, is the mongrelization it has undergone throughout the millennia, which started among modern humans especially with the early Caucasoids and Basal Eurasians.

I consider the Basal Eurasians to have been an Iberomaurusian, Egyptian, and Southcentral Asian wing of the proto- or early Atlantean society (before its disruption by the Younger Dryas), connected to the rest of North Africa by way of the Nile[680] and Western Europe by way of the Atlantic Ocean and the Mediterranean. Basal Eurasian, or at least Basal Arabid, likely contains an ancestoral component of Australoid outside of Africa and just across the Red Sea, too. Either alone, when synthesized into Mediterranoid, or in successive waves, and likely in mixing with Australoids, Basal Eurasians would contribute a great deal to Arabian and Elamo-Dravidian peoples, as well as to Africa at large upon an apparent back-migration. Levantoids, having it moreso than Negroids,[681] may have contributed toward a more aquiline noseform in the Eurasian Mediterranoid. It may not be entirely inappropriate, if we are not categorizing race wholly according to genetic relation but according to phenotype, to consider the

---

[676] Perhaps also Capoids, Mechtoids, and Australoids

[677] They are also, however, associated with a strata that may be found among Hornids, Cushites, Ethiopids, or Nilotes, as well as Arabids and Dravidians, but in their archaic stages

[678] Alternately, Australoid ancestors of the Dravidians may have been some of the first farmers and passed their knowledge to the Basal Eurasians. Other origins, however, including convergence or "multiple discovery," have been strongly supported as well, including native development of advanced horticulture in the Americas and by Polynesians.

[679] Coon[1], 485

[680] Which had an Eastward branch, sometimes composing a sea or lake, going toward Maurtania

[681] Non-Pygmy Congoids; Bantus or Bantoids

Northeastern African populations of Horn Africa perhaps all the way across to Chad and possibly beyond[682] to be of some relation to these Levantoid people, perhaps even deserving of a classification distinct from Congoid peoples. Indeed, many anthropologists have classified Horn Africans and others surrounding the Horn of Africa as proto-Mediterranoids or proto-Caucasoids, if not part of the Caucasoid or Mediterranoid race-proper.[683]

Basal Eurasians, similarly to Neanderthal, weaved cloth, and they also made pottery. *Megaliths*, or giant stone structures such as Stonehenge, also appear during the Neolithic era thanks to the Basal Europeans. This group is likely related to the megalithic builders of Europe as well, including the builders of Stonehenge.[684]

The Neolithic peoples in Europe would include especially two branches, a Danube River culture, associated with the Linear Pottery people in the West, and a Mediterranean culture in the Western Mediterranean, associated with the Cardial Ware people. Other Neolithic cultures or types include those such as the Sesklo, Starcevo, Vinca, Karanovo, Triptillian, Boian, and many others. Some of the Neolithic peoples maintained a hunter-gatherer lifestyle for some time, their Neolithic efforts not being defined in the Western manner, regarding horticultural activity, but instead by Eastern (Russian) terms, of dealing in pottery or advanced textiles. For instance the Pitted Ware were hunter-gatherers who have nonetheless been named for their wares. The Pit-Comb Ware people may be seen similarly, although they dabbled in some minor horticulture as well. Sardinians and Basques have a lot of Neolithic ancestry, also being related genetically to the Guanches of the Canary Islands. Perhaps the strongly Basal Eurasian Beaker people, along with Cro-Magnoid themselves, are a source of the Vasconic substrate to the later Indo-European languages.

In the Triptillian culture, an Eastern European culture, fetishes were present, perhaps suggesting some connection to Capoid[685] migrations into Europe and the presence of early seafaring Mediterranoid peoples (similar, in this way, to the Cyclopians and Minoan people). The Danubian culture is an example of an early European Neolithic society, associated with the Linear Pottery Culture. The Danubians had used "celts" to fell trees, their people living in longhouses. It is with the axe-like tool called a *celt*[686] that Celtic people would be identified, themselves not having been an identity group so much as a culture, if even that. Like the Levantoids, as well as the Strandlopers—perhaps refugees from the fall of Atlantis— the Danubians were avid mollusk hunters.[687] They are, perhaps, an example of Old Europe, before Indo-European advancement, as described by Marija Gimbutas and other archeaologists and anthropologists. These peoples became Alpinized later on down the road, through admixture with Neanderthals and incoming Caucasoids from the Caucasus.

---

[682] This zone had been considered in ancient times to be an extension of Berber territory, and oftentimes still is

[683] It is also likely that there is a native Omoid-derived substrate, likely a progression from the Omoid, perhaps even proto-Mechtoid, to these proto-Mediterranoid African populations. It's not an impossibility that these populations derive from migration routes established by *Homo erectus* that would be mirrored by peoples to come, such as those along the Movius Line or Jat Belt, discussed in detail later.

[684] This may have represented travel along an old latitudinal, perhaps even tropical, line that corresponded to some extent to Movius's Line, maybe itself the old equator, possibly moved along by way of sea, establishing some of the Old European cultures such as what would eventually become the Etruscans, Aquitani, and etc.

[685] Venus figurines show signs of *steatopygia* suggest Capoid infuence

[686] These celts would fall, timewise, in between the use of Stone Age hand axes as stopped at the Movius Line and the Bronze Age axes as were used by the Battle Axe People

[687] Remember that Phoenician purple came from mollusks

The same general rule of limited hierarchy found among hunter-gatherers is largely true in horticultural societies, though less purely so. While the existence of headmen become more prominent, their political powers remain fairly limited. Nolan and Lenski remark that

> The power of political leaders has been quite limited in nearly all simple horticultural societies. Even in the larger, multicommunity societies, villages have virtual autonomy except in matters of war and relations to other societies.[688]

However, Lenski suggests that "one of the striking differences which emerges from any comparison of [hunting and gathering and simple horticultural] types of societies is that social inequality is more pronounced in the horticultural."[689]

One mark characteristic of political authority is the existence of polygamy, particularly when the practice begins to leave some men, who are not voluntary bachelors, without wives. Polygamy does occur even in conditions of relative equality, among hunter-gatherers, particularly involving widows rather than previously unmarried women. A headman, for instance, might have two or three wives, but not generally at the expense of the other men in the band or clan having wives for themelves, if they want one. But in advanced horticultural societies a headman might begin to form a harem at the expense of wives for other men in the clan, a sort of reversion to polygyny.

Human social organization and leadership seems to be intricately connected to religion or spirituality and philosophy; in short, to one's *worldview*, or way of interpreting events. Human beings originally took to an animistic worldview, in which everything was considered to have a spirit. Animism would eventually give way to polytheism, and then monotheism. But ultimately, all religions rest on the prior existence of animism, and must refer to animism for their foundations. This animism was often understood within a greater context of Nature worship or pantheism, a recognition for the "web" and "cycle of life," which implied an interconnectedness that many of us in the modern West might not even have considered (though it lacked the teleology that would define Western philosophy after Egyptian influence). Among Neolithic peoples, and in particular horticulturalists of Europe, there was a tendency toward worship of Mother Earth or Mother Nature. Soothsaying was also becoming popular.

In primitive societies, spiritual or religious leaders such as shamans provided a good deal of political leadership. Nolan and Lenski suggest that "in some simple horticultural societies, shamans also serve as headmen or chiefs, because of the awe or respect in which they are held," but that in "others, secular leaders assume important religious functions and become quasi-religious leaders."[690] These leaders are generally limited to the functional role of *master of ceremony*, basically serving a role of primitive chairman. Nonetheless, as time went on, some people during the Copper Age would become increasingly powerful. It is not uncommon for the position of the shaman in primitive societies to be held by the mentally ill, such as those who may be manic or schizophrenic. This can, at times, and especially if a hierarchy is established, become an abusive situation, whereby leader-worship can develop into a sort of fetishism, wherein one's deceased leader's animistic spirit is understood to be contained within an idol or sacred object, becoming a sort of spirit god, having been prior, in life, a god among beasts. This idol may become a spirit unto itself, embodying elements that described the past

[688] Nolan and Lenski, 115
[689] Lenski, 126
[690] Nolan and Lenski, 115

leader, such as his spirit animal, thereby becoming a *totemic emblem*—a symbol of an animal having religious significance— of the origins of the ethnic group,[691] typically a clan or tribe.

A coordinated mutual aid, established upon a mutual understanding, a conscious mutualism, would not fully express itself until the formation of clans, and particularly among their leadership.[692] Patrick Nolan and Gerhard Lenski treat clans as extended kin groups, which act as mutual aid associations for their members. They say, "[k]inship systems," in simple horticultural "groups, or *clans*, are common and usually very important," because "they function as *mutual aid associations*, providing individuals with protection against enemies and with economic support."[693] They point out that the political hierarchies among advanced horticultural peoples were often established through clan rule, with the headman of a leading clan often becoming the leader of the tribe. They say that "the most powerful or respected clan often assumes leadership of an entire community, with its head serving as its headman, or even as tribal chief."[694] To my view, if what they say is correct, the mutual aid association of the clan represents a mutualist foundation for all governments, all of the originals of which convergently evolved from clan rule during the horticultural era, only later to become a learned tradition or cultural technology.

Perhaps the first tribal religion involved the conception of a "corporate group," or a group of people, such as a clan, cult, tribe, or etc. beyond the nuclear family, that one identifies oneself with, as being a part or extension of. For instance, the Cult of the Cave Bear was a cult, a corporate group, to which its members adhered as a common identity. Many peoples throughout the world practice totemic religions of this sort, the cave bear being a specific example of a particularly ancient totem, rooted in *astrotheology*, the deification of the stars. John Yarker says that

> the seven stars of the Great Bear makes a complete turn round in 365 days or thereabouts. The 13 lunar and 12 solar months in the annual birth and death of the sun is a later and more complicated calculation of a year, though it corresponds with the annual revolution of the seven stars round a polar centre.[695]

Totems, or group emblems often of an "animal spirit" associated with the clan, are important for the development of clans. One example of totemic art is the famous cave painting found in France, *The Sorcerer*, which depicts a humanoid figure with animal characteristics, an example of zoomorphism or anthropomorphism. Interpreted as a combination of totems representing corporate groups, this cave painting— often interpreted as the first image of a god, too, and found deep down in hard-to-reach caverns— is most likely an image from a secret society whose mission it was to form one of the very first *tribal* groups, a combination of clans who were not necessarily related by genetic lineage. As such, it would represent something of a proto-constitution, or covenant, around which initiates as representatives from the clans would gather. Totems are especially pronounced among people such as the Tlinglit, and other fishing and proto-maritime societies of the Pacific Northwest of North America, who have become famous for their elaborately-decorated *totem poles*, essentially large poles that tell the history of totemic succession where such has taken place along with other major events in a people's history. Totem poles may indicate *moiety* relationships— clan intermarriage agreements— and other important relations between clans or within tribes. Totems, however, need not take the form of a pole.

---

[691] Could animal totems speak of more than symbolic origins by way of convergent evolution?
[692] As hunter-gatherers in band societies are fully-evolved and sentient *Homo sapiens*, we must address clan formation as a cultural, rather than biological, evolution
[693] Nolan and Lenski, 114
[694] Nolan and Lenski,114
[695] Yarker

Totems are still around today— though they are not always anthropomorphic, zoomorphic, or zoological— in many forms. These totems, stacked one upon another in succession, give way to totem poles, coats of arms, family trees, and other means of tracking one's ancestral links through the tribe and, more specifically and most importantly for authority, the tribal leader.

Perhaps the sites that receive the most attention for Neolithic settlements are Gobekli Tepe and Carahan Tepe, which were essentially community centers that were likely created by "masters of ceremony," who would host ritual feasts between their peoples together. It was likely this sort of inter-tribal alliance-building between Master of Ceremony types that allowed for chieftainship and stratification to become a phenomenon later on. Eventually, it seems that these sites would be looked after by resident officials, perhaps lawmen or priests, probably both. At first, their residency was likely temporary and perhaps seasonal, plausibly including functional or ritual specialization among officials. They probably served as courts and religious ceremonial places, bringing late hunter-gatherers and horticulturalists together, who would support the resident officials with offerings. This corporate support allowed otherwise nomadic headmen to provide for or become a sedentary class of officials, which incentivized horticulture, because it allowed one to produce more food to share with the officials, and so to gain status as an upstanding affiliate.

In the Southeastern Asian region called *Zomia* there are many peoples who are said, by anthropologists such as James C. Scott, to be actively evading the state-centered cultures of the more lowland areas (Zomia is a highland zone, though not as high as the Himalayas or Tibetan Plateau to its West). Among these groups, points out Sran Samantarat, in "Outline of Karen 'Founder's Cult' System in 'Zomia' as Leadership Evolution in Southeast Asia," are found the Karen people, who maintain a proto-governmental fraternal system based in a clubhouse or ritual hall called a *blaw*, which is led by a founder-leader called the *blaw kho*. Like modern fraternities, such as Freemasonry, this fraternity is characterized by what Samantarat calls a "*continuum* [*of*] *primordial religious systems*." The deliberation of the fraternity involves working according to a dialectical system of "origin, change, and dismissal/revival," which Samantarat speaks of as "the hidden one in the traditional ideology."[696] This founder's cult shifts toward kingship when it moves from a highly civic space involving the voluntary entourage of a functional leader toward a space dominated by the leader who is still supported by the entourage, albeit in a circle which has widened beyond it and has come to accept his charismatic authority. All of this is built upon a cult that understands the leader to have contracted with the gods of the land, who are the original owners and who recognize the leader as a mediator between them and the leader's entourage. *Millenarianism*, the belief that a time of change is coming, is also a feature in the *blaw*. The founder's cult of Southeast Asia would become a major feature as well in the Polynesian societies that are derived also from Southeast Asia.

Ideologies such as the founder's cult is where the story of aristocratic and noble mutualism begins, as a break from strict biological mutualism to socio-cultural mutualism. And the result of the difference between those who evolved a highly disciplined mutual aid and those who did not was *government*, the rule of those who did over those who did not.[697] According to Carroll Quigley, in *The Evolution of Civilization*, aristocratic society

> did not accept the equality of men, but did insist on a fraternity of equals within the select group of participants. It emphasized the dignity of the individual, at first only

[696] Samantarat

[697] Of course, other factors come into play as well. Geographic advantages and economic rent are notable major factors in the success of societies. However, geographic advantages may also serve to biologically or culturally advantage or disadvantage populations, as well.

> the individual within the chosen group; but later, as democratic influences spread, it tended to grant equality and individual dignity to all, not by bringing the outlook of ordinary men into the select group, but rather by spreading the outlook of the select group outward to ordinary men.[698]

In many cases, superior resources were the culprit for the dominance of one society over another, and this demonstrates no moral or innovative superiority, but may, in social Darwinistic terms,[699] be considered a hindrance to healthy, allowable intra- or intersocietal selection.[700] But in other cases, cultural superiority, such as a proclivity for learning or organization, is the culprit, and in such cases represent a healthy, allowable element of selection.[701] Such processes of natural selection may be uncomfortable, but they have nonetheless been essential to the displacement of defunct ideas with those that are better working.[702] Nolan and Lenski state that, "from the standpoint of intersocietal selection," that genetic or memetic mutuations that

> influenced societal growth and development have been especially important, because societies that have grown in size and developed in complexity and military power have been much more likely to survive and transmit their cultures and institutional patterns than societies that have preserved traditional social and cultural patterns and minimized innovation.[703]

Indeed, innovations are immensely powerful for a society. One such innovation would include the development of working metal.

The *Chalcolithic Age*, or *Copper Age*, sometimes styled the *early Bronze Age* or *late Neolithic*, had possible beginnings in the Fertile Crescent, perhaps among participants in the *Hassuna culture*, participants in the wider Painted Pottery Culture, though use of copper among the Americanoids needs to be explored in more detail. Copper was immensely important to people who had otherwise been used to doing everything with stone, bone, wood, or fiber. Copper was malleable, and able to be formed into a large number of useful objects. Lead was also employed, perhaps even before copper. The *Beaker people*— a Neolithic culture from whom the Hallstatt and other proto-Celtic and proto-Germanic people are derived— spread copper through Europe. Otzi the Iceman had also been found with a *Mondsee copper* axe, one of the earliest European coppers, emulating the Vinca culture in the Balkans, known for

---

[698] Quigley, 279

[699] *Social Darwinism*, a term applied to the philosophy of Herbert Spencer as well as to those who bastardized his intentions, does not necessarily, though it may, imply an unempathetic outlook on others. Spencer himself supported the helping of others, and saw morality as a product of natural selection, such that those who were more moral—that is, helped others—, among other things, were more likely to be the winners in the outcome of the "*survival of the fittest*," a phrase that he famously coined. While it may be taboo, I use the term to take it back from antisocial elements, and to reconsider the importance of evolution for human societies. Further, it must be understood that fitness is relative. "Survival of the fittest" means that fish are more fit than us for the water, monkeys for dwelling in tree tops, etc. It does not necessarily imply the universal and eternal superiority of the fit.

[700] I'd hate to be a defeatist and submit to the idea that superior resources alone can maintain one's position, without need to keep up with cultural technologies such as new forms of organization. The Hussite victories over larger, better-trained armies suggests that emergent forms can stand up to older systems, and the American Revolution— fought by a mere three percent or so of the population of the colonies— demonstrates that they can be maintained for a considerable amount of time. While resources are an important factor, a well-organized force can do what it can to take possession of those resources and their benefits through cunning or skill.

[701] Societal merit especially demonstrates itself when empires are formed over other, once sovereign, states, and mega-multicommunity societies are established.

[702] Cultural revolutions will oftentimes fuel such transitions, as when the Enlightenment led to the Western transition toward liberal republics.

[703] Nolan and Lenski, 55

their large settlements and copper work. The proto-Germanic Battle-Axe People were also a Copper Age people.

Copper Age Economy

Personal possessions, such as tools, clothes, family animals, and other forms of moveable property, as well as well-utilized shelters, and even garden plots, have almost always and universally been considered by modern humans to be the belongings of the creator of them— whether individually or as a group— or the one who had received them in gift or trade, especially so long as they can be defended, which is most certain when it is physically possessed or being used. Most communities have considered belongings that are in one's domicile to be under one's control and in one's protection, in which case the defense of the items would be socialized through customary law and not entirely individual. To take something from another's home—whether that be a cave, a yurt, a teepee, a house, or what have you—has generally been considered to be an act of theft or burglary, which, at the very least, goes against the customs, but often the customary law or common law of most people, sometimes even being a capital offense or cause for banishment. Ultimately, structures such as property relations depend on spiteful actions from one's neighbors for enforcement, which may appear altruistic, but is not.[704]

Private property in land, distinct from mere possession, was not really expressed until people started taking up horticulture, pastoralism, and forming clans, and then producing hierarchies during the Copper and especially the early Bronze Age. Before private property, land was merely held by hunter-gatherers, fishers, and herders, by the tribe as a whole, as an often shifting territorial claim, with individuals being apportioned area within the territory for their living area, their individual claims, which often shifted at first as well. Gardens and sometimes enclosed pastures would then become important capital improvements to the land, and semi- and fully-stationary societies would begin to treat the land these improvements were on, mistakenly, as improvements to the land itself, thereby allowing the land to fall into the hands of private owners, forming legal structures around them. It is important to understand that *property* means exactly what it says, "an attribute," such that one's property, as a result of admixing labor with land, is one's attribute, an extension of oneself.[705] *Private*, from *privare*, meaning "to deprive [others]," is distinct from *personal* in that *private* describes that which is beyond *personal,* that held for one's own sake directly. That which is *private* is a *privation*, "a condition of shortage." It is held indirectly or in absence, used by others, and also includes a perpetual claim to land. An absolute monarch, a landlord or land speculator, and a sole proprietor who employs others, rule privately or in absence, controlling others who use what the rulers claim to be theirs. This is different from a hunter-gatherer or an independent artisan, who control only that which they use directly. Private property is the claim that natural resources and the productive possessions of others—those things that are being used by them, that are under their direct control— belong to someone else because they had it prior. As Proudhon suggests in *What is Property?*,

> They did not forsee, these old founders of the domain of property, that the perpetual and absolute right to retain one's estate—a right which seemed to them quite

[704] Spite appears self-sacrificial at times, because it involves a loss to oneself, but it is also an important means of ensuring that people do not take actions that may inspire spite, and so is a driver of moral evolution. Without spiteful action to hinder it, people would get away with committing more wrongs.

[705] This was a useful concept, particularly when economic rent was not at play, but as population would grow more and more, it would become more and more necessary to distinguish the value created by the land, the *rent*, from that created by the labor, the *wages*

> equitable, because it was common— [...] tends, consequently, to nothing less than the destruction of that equality which they established it to maintain.[706]

Customs that have favored private property in land, solidifying land claims into law and thereby allowing them to become perpetual, have coincided with concentrated power in the hands of elites who establish ruling classes.[707]

A proto-*maritime culture*— a fishing society which has begun to rely on overseas exchanges— appears to have had long ago been initiated by some archaic human in Southeast Asia. This was likely a derivative of *Homo erectus*, or perhaps even *Homo luzonensis* or *Homo floresiensis*, often three to four feet in stature, with very modern skulls. It appears that Denisovans and Australoids had mixed together, as well as with these little people, in the islands.[708] Hybridization contributed to some island genetics, especially Negritos and Austro-Melanesians, dominant in Australia and New Guinea; and Southeast Asian paleo-Mongoloids or proto-Malays, who would become dominant in maritime Southeast Asia and Micronesia.[709, 710] This may have begun after the Toba eruption, in a process culminating in many millennia. Austro-Melanesians, or Australoids, among other Pacific Islanders as well as Americanoids, have been known to worship volcanoes, and seem to have gotten to their location in Oceania following a pilgrimage after the Toba Volcano eruption, whereupon they collected some Denisovan genetics. Volcano gods are often worshipped among Oceanics and along the Pacific Ring of Fire in general. If a Denisovan-Australoid hybrid, especially a knowledgable shaman, could have convinced anticipants of the Pacific Islanders— perhaps something like Java men, *Homo floresiensis*, or *luzonensis*— that they had caused the Ice Age eruptions, they may themselves have garnered a god-like

---

[706] Proudhon[2], 106

[707] This may have had mutualistic elements, insofar as the recipients of the new private property rights had also been the grantors of them (which is likely the case, considering that a governing class both made the rules and owned the land). Of course, this was only a soft variety of mutualism. While the formation of such customs and the cunning may have been a mutual construct on behalf of an oligarchical, warrior class, working class Mutualists of today, who lack in the inheritance of such elite mutualism for themselves, have no other option but to out-do their well-established opponents, and to out-mutualize them.

[708] The discovery of elite jade jewelry in Denisova Cave before the known Jade Road (and the importance of Jade to the later Sino-Tibetan ruling classes), the presence of Denisovan DNA among both Tibetans and Austro-Melanesians (especially New Guinean highlanders), the advanced economic arrangements of Pacific Islanders, and the importance of Tibet in ruling class mythology, suggest Denisovan involvement by way of Austro-Polynesians, perhaps explaining the Polynesian phenotype suggested by the gold, slanted-eyed mask of the Egyptian Pharaoh, King Tut (who came much later, but may nonetheless have been aware of proto-Polynesian roots in the Egyptian ruling class). It is also interesting to note the similarity between the Capoid phenotype (epicanthic folds, yellowed skin) and that of Polynesians, as well as their similarity in having been pressured by newer groups in a Southward direction, into the islands of Southeast Asia and Oceania and along the beaches and into the desserts of Southern Africa. Unlike the Northern Mongoloid variant, which is considered to be more recent, the Southeast Asian and Polynesian phenotype has been described as *paleo-Mongoloid* and represents an older, less cold-tolerant, variant.

[709] This was a time before the Siberian-Alaskan land bridge, the Bering Strait, was crossed by those proto-Mongoloid, Ancient North Eurasians (a paleo-Turanian people) who would contribute to the Paleo-Amerindians and their derivatives, such as the Anasazi, just before the Younger Dryas impact. It would, later on, be crossed by the Mongoloid ancestors of the Inuit, Apache, Navajo, and so on.

[710] Those Australoids who had mixed with the little people—perhaps having something to do with the Nephilim tale— contributed variously to peoples such as the Negritos, proto-Malays, and what would become the Micronesian and Polynesian peoples. Polynesians are at least one branch of the Mediterranoid, though controversially so.

status from them. It appears that, during the Neolithic, the inheritors of the Denisovan lineage had established themselves as a sort of mercantile ruling class in Southeast Asia and Oceania.[711, 712]

Considering a possible relationship between Denisovans and retreating Capoids in Siberia (such as in Mal'ta), as well as the possibility that Capoids had themselves been connected to the Atlantean society in some way, it may be that Capoids were also involved in this picture, in league with Denisovans. Together, they may compose a significant percentage of the Mongoloid populations of Asia. Over time, the Denisovan genetics would be largely deselected, but the cultural aspects would remain, as they do today among the Pacific Islanders of Oceania and Maritime Southeast Asia, where Capoid genetics may also have been spread.[713]

Primitive economy outside of the immediate family was often oriented around "gift" exchanges, potlatching, and bartering, similar to the gift economies still alive in Austromelanesia today. But *gifting* in anthropological terms is restricted to what is referred to in biology as *reciprocal altruism*, and does not represent *true altruism* or a *true gift*, the selfless efforts taken purely for the sake of others, or letting go, with no reward expected. For instance, Victor Barnouw, in *An Introduction to Anthropology: Ethnology*, says that

> The donation of a gift places the recipient under an obligation. He may not actually want to have the present, but it would be difficult for him to refuse, for in that case the insulted donor might become his enemy. To give and receive gifts is an age-old way of maintaining peace and friendship. The recipient is not only more or less obliged to receive the present, but sooner or later he is obligated to return it with a gift of about equal value.[714]

Marcel Mauss, famed anthropologist, also tells us, in *The Gift*, about the reciprocal obligations involved in gift economies. Mauss says that in "Scandinavian civilization, and in a good number of others, exchanges and contracts take place in the form of presents," and that "in theory, these are voluntary," but that "in reality they are given and reciprocated obligatorily."[715] *Potlatch* was also described by Mauss. Potlatches are similar to what are called *potlucks* in the United States, where participants each bring a dish to eat, except that potlatches involve the giving of gifts. Mauss says that the American Northwest tribes "spend the winter in a continual festival of feasts, fairs, and markets, which also constitute the solemn assembly of the tribe," and that they are "organized by hierarchical confraternities and secret societies."[716, 717] Mauss describes the potlatch practice, saying one cannot "refuse a gift" or "refuse to attend a potlatch." He says that doing so "is to show that one is afraid of

---

[711] They made especially strong use of their relationships to proto-maritime peoples, likely acquiring culture from archaic *Homo sapiens* derived in part from earlier *Homo erectoids* mixed with other *Homo sapiens* coming from out of Africa and the Middle East

[712] This was likely through something like a *Big Man* arrangement— *Big Man* being a leader in a gift economy—involving some sort of shamanic mediator between man and the gods

[713] This is assuming that Denisovan culture was involved in initiating or as a sort of Big Man of the early Jade Road, an assumption made because of the quality jade (chloritolite) ring (as well as a marble and ivory one) discovered with Denisovan remains, which suggests, to me, that the Denisovans were high-status participants in the jade exchange. Because of the high level of Denisovan DNA among the highlanders of New Guinea, as well, and because these highlanders are Australoid by phenotype—representing the earliest wave of *Homo sapiens* migration—it is assumed that Denisovan culture, which appears to have been hierarchical, was spread by way of genetic and cultural progeny of the Denisovans, assumed to be Stone Age cultural and economic elites.

[714] Barnouw, 101

[715] Mauss, 3

[716] Mauss, 6

[717] It's interesting to note that the Mutualists much later—the working class Mutualists of industrial societies, whose thought composes the focus of this book— also took to or grew from confraternities and secret societies

having to reciprocate," and "every gift is always accepted and even praised," but that a "gift is receieved 'with a burden attached,'" and that to "refrain from giving, just as to refrain from accepting, is to lose rank— as is refraining from reciprocation."[718]

Another anthropologist, Marshall Sahlins, is famous for his studies into Melanesian gift economies and Polynesian command economies. In the *moka exchange* of Melanesian peoples such as the Mbowamb in the Mount Hagen area of New Guinea, gifts are understood to come with obligations of repayment or otherwise loyalty; in other words, the recipient of a gift goes into debt to the gift-giver. And gifts cannot be refused. The *Big Man* is the one who puts the most followers into debt with gifts, and so commands the loyalty of the most men. It should be clear that gift economies often produce hierarchies, in which one cannot marry without reciprocity with the Big Man. Such hierarchies may result from the private ownership of land, in which some have better pastures on which to raise their pigs, and thereby have more *moka* to exchange. R.J. Foster, in "Melanesia: Sociocultural Aspects," from the *International Encyclopedia of the Behavioral and Social Sciences*, remarks that

> Big Men typically validate their personally achieved leadership through generous distributions of wealth. They manipulate networks of reciprocal exchange relationships with other men, thus successfully managing the paradox of generating hierarchy—even if only temporary—out of equality.[719]

Psychologically, a Big Man might have characteristics approximating a narcissist. Narcissists are known for giving "gifts" in order to extract favors later, much as is done by Big Men. Suzanne Degges-White, in "Beware of Narcissists Giving Gifts: Strings Are Attached," says that "narcissists give gifts with an eye to maintaining a relationship with the giver and to maintaining control in that relationship."[720] Indeed, in our modern time, this is known as *financial abuse*, and can cause all kinds of problems for the victim, such as what is called *narcissistic abuse syndrome*, correlating to a psychological reliance on the narcissist associated with *enmeshment*,[721] a blurring of the lines of individuation,[722] sometimes resulting in a "surrogate spouse" sort of relationship between parent and child,[723] or even "covert incest."[724]

Assuming that the jade ring found with the Denisovans expresses an important role of great status, and following the economic habits of Eastern Asia, maritime Southeast Asia, and Oceania, especially among Papua New Guinean highlanders where high amounts of Denisovan genetics are found, we might assume that the Denisovans were the progenitors of what would become the Big Man system. It is likely that some Australoids had come across Denisovans and intermixed with them, possibly in Tibet, but otherwise somewhere in East Asia. Upon their journey into Sundaland and maritime Southeast Asia, these Australoids, perhaps with a Denisovan leader, would come across peoples such as Java man, *Homo floresiensis*, and *Homo luzonensis*, who are very small pygmy humanoids. Being much larger than they are, the Denisovans and Australoids would quite literally be big men in comparison, capable of bossing around the little people and putting them into debt through the *moka* exchange. Deniso-Australoids could possibly have used their large size and wisdom to influence the political structure of their smaller Island companions, becoming the Big Men to the *luzonenses* and *floresienses*, a system

[718] Mauss, 41
[719] Foster

[723] As suggested by John Bradshaw
[724] An idea of Kenneth Adams

that would continue on long after, perhaps after the Deniso-Australoid had hybridized with them. This is the most likely genesis of the Big Man system.

Another gifting system in New Guinea is the *Kula Ring*—discovered by Bronislaw Malinowski, a founder of anthropology—, in which items like "kula" are exchanged purely for purposes of social status. Victor Barnouw writes that

> The kula is a form of ceremonial trade, intertribal in scope, occurring in a wide range of islands. Within this ring two classes of valued objects are exchanged, red shell necklaces and white shell armbands. The necklaces travel in a clockwise direction along the ring, while the armbands move in a counterclockwise direction.[725]

Participants of the Kula Ring, high-ranking men, will partake in "man-marriages" together, representative of the loose reciprocity established between the two groups of which the men are leaders. They make long journeys through the ocean to exchange without a gain other than to maintain the relationship, which is memorialized by changes made to the "kula." An armband will be exchanged for a necklace, and food will be exchanged kind-for-kind and pound-for-pound, such that pounds of sweet potatoes are given in exchange for the same amount of sweet potatoes. While not directly economical, the ritual serves to display trustworthiness and to maintain connections between groups, who render more useful aid when times are tough.

Still another exchange network is the Sepik Coast exchange, which works like a loose barter network of delayed reciprocity. Abelam Beg Men are known to gift their worst enemies their best sweet potatoes. Failure to grow bigger ones diminishes one's status.

Alongside gift economies and prestations, people would barter, as groups or as individuals. This often took the form of the *silent exchange*, whereby a trade spot was selected, whereat traders would place items for exchange that would be picked up by the other party and replaced with something of roughly equivalent value, generally something that the other did not have easy access to in their area. Barnouw gives us an example, called *silent trade*. He says that

> One man leaves some animal skins or other gift in a customary place. The man who collects it replaces it with an exchange gift. In this way, the Pygmies of the Congo trade with their Bantu neighbors without having to confront them.[726]

It's not impossible that "offerings to the gods" had begun as a form of silent trading, including what would develop later into burnt offerings, perhaps from offering, knownst or not, cooked food, including one's own children. This would become entangled with supserstition, encouraged by the shamans and priests. As Ingersoll says,

> Man, in his ignorance, supposed that all phenomena were produced by some intelligent powers, and with direct reference to him. To preserve friendly relations with these powers was, and still is, the object of all religions. Man knelt through fear and to implore assistance, or through gratitude for some favor which he supposed had been rendered. He endeavored by supplication to appease some being who, for some reason, had, as he believed, become enraged. The lightning and thunder terrified him. In the presence of the volcano he sank upon his knees. The great forests filled with wild and ferocious beasts, the monstrous serpents crawling in mysterious depths, the boundless sea, the flaming comets, the sinister eclipses, the

[725] Barnouw, 103
[726] Barnouw, 102

> awful calmness of the stars, and, more than all, the perpetual presence of death, convinced him that he was the sport and prey of unseen and malignant powers. The strange and frightful diseases to which he was subject, the freezings and burnings of fever, the contortions of epilepsy, the sudden palsies, the darkness of night, and the wild, terrible and fantastic dreams that filled his brain, satisfied him that he was haunted and pursued by countless spirits of evil. For some reason he supposed that these spirits differed in power—that they were not all alike malevolent—that the higher controlled the lower, and that his very existence depended upon gaining the assistance of the more powerful. For this purpose he resorted to prayer, to flattery, to worship and to sacrifice.
>
> These ideas appear to have been almost universal in savage man.[727]

In a certain sense, silent exchanges are not purely divorced from gifting, but they are much closer to bartering. Bartering was especially useful between groups, but problems of barter, such as the "double-coincidence of wants" and the on-handedness of valuable possessions needed to make exchanges, would eventually be evolved around by way of gifting, commodity money, and credit.[728] That silent exchanges, which often take place between larger and smaller people such as the Bantu Negroid and the Pygmy Mbuti, are similar— in that regard— to the possible origins of Big Men, suggests either common origins or convergence, if not some strange mix of the two.

The penis sheath-wearing Kapauku are an exception to the use of gift economies by Big Men and others. They have been described by their premier anthropologist, Leopold Posposil, as primitive capitalists. The law man or judge of the Kapauku— a Big Man called a *Tonowi*—lends wealth rather than gifting it to put people into debt. Legal scholar, Bruce Benson, tells us, in *The Enterprise of Law: Justice Without the State*, that "[r]ecognition of law was based on kinship and contractual reciprocities motivated by the benefits of individual rights and private property."[729] He says that any Kapauku "could choose to contract with any available *Tonowi* (availability generally involved kinship)." He says that usually "followers became debtors to a *Tonowi* in exchange for agreeing to perform certain duties in support of the *Tonowi*," and that "this position of leadership was achieved through reciprocal exchange of support between a *Tonowi* and his followers, support that could be withdrawn by either party (e.g., upon payment of debt or demand for repayment)."[730, 731] The indebted were under the judicial authority of the *Tonowi*, and so became subscribers to his dispute resolution services when they became voluntarily indebted to him. Generally, offenses were compensated through payment, but otherwise were met with ostracism or even, in extreme cases, with death. Benson says that "among the Kapauku, an individual could be tried only by a *Tonowi* of a group to which he belonged." He says, "[r]eciprocities are the basic source both of the recognition of duty to obey law and law enforcement in a customary law system," and that "[b]ecause the source of recognition of customary law is reciprocity, private property rights and the rights of individuals are likely to constitute the most important primary rules of conduct in such legal systems."[732] Like the Big Man system, and perhaps also the system of burnt offerings and silent exchanges, the economic arrangement of the *Tonowi* may have some relation also to the influence of

---

[727] Ingersoll[1]

[728] It was once thought that early economies existed by way of barter, but barter is actually too clumsy, and relies on the double-coincidence of wants; that is, on each party wanting something the other party has at the same time, and to an equal degree, feeling it to be of equal value, use, or, as best used in terms of economy, utility. Instead, hunter-gatherers would give each other things, and loosely keep track of credits and debits. Barter, when it existed, was usually symbolic within groups, or occurred between them, but it did occur also as a spot exchange.

[729] Benson, 17

[730] Benson, 16

[731] Voluntaryism of this sort is essential to mutualism

[732] Benson, 12

Denisovans, deriving their influence not from some inner achievement, or even necessarily size in this case, but instead from networks with the outside world that provided advantages.

While not an economic arrangement, the Duk-Duk secret society of the Tolai people of New Guinea, and those like it across the world, would certainly become an influence on political economy, perhaps being responsible for the political part of things. The Duk-Duk come out only on a full Moon, and when they do they are allowed to punish people even by burning houses and by killing them, performed by men of no direct relation to the victims, often from other villages. To join the society, one pays dues in the form of cowry shells and must be a man, thereupon learning its secret signs. Dory Vigil, an Apache man, interviewed in Jesse Janson's *The Bigfoot-Alien Connection Revealed*, about the paranormal, described the noise of Sasquatch as a sort of "duk, duk, duk, duk."[733] Bigfoot hunters regularly go around banging trees with sticks to make sounds to lure Bigfoot which sound similar to those described by Vigil. Could this be of any relation to the Duk-Duk secret society in New Guinea, which dresses up as a creature with a mask and costume? It may be that the Melanesians had been inspired by this practice— perhaps something like a "snipe hunt"— upon venturing into the New World, from the ancestors of the Apache. Though, if Sasquatch is of some relation to Denisovan, they may have had something similar in their own volcanoes in New Guinea. Indeed, *Meganthropus* was found in maritime Southeast Asia, not too terribly far away. Some have even suggested that ground sloths may explain Sasquatch.[734] Whatever the case, I believe there to be a clear connection here between the Apache tracking of Bigfoot and the Melanesian men dressing up for their Duk-Duk. The question is, is it entirely make-believe, or is there something at the foundation of all of this? To make matters more confusing, Sasquatch researcher Mike Rugg of the Bigfoot Discovery Museum might have been in possession of a *Meganthropus* tooth found in Santa Cruz, California, but it has since been confiscated or lost by the labs sent to for genetic testing and identification.[735] It has been wrongly compared to the tooth of a *Camelid*, appearing to be that of a primate claim the Sasquatch enthusiasts, and indeed looking different from Ground Sloths as well.

Grade-taking systems also exist among the Austric peoples, including the "pseudo-Mediterranoid" Nesiotids, here considered to be a component of Mediterranoid-proper. These are meritocratic systems, sometimes fairly egalitarian, despite the ranking system, in that they are open to anyone willing to be tested and avoid arbitrariness. Individuals are tested, earn insignia and are ranked, often going through steps to become officiated to perform certain ceremonial duties, such as ritually slaying pigs— the indigenous tradition of Vanuatu[736]— or to take up leadership positions. The grade-taking system is notable for its relative lack of arbitrariness and its level-handedness, being considerably impartial toward personality and putting the focus instead on character and ability, particularly the ability to perform the civil function satisfactorily. Even where chiefly positions exist, grade-taking systems may act complementary or as a certain quality control, making the position more meritocratic. Officiation within grade-taking systems might be signified by official insignia. It is likely that the ancient mystery schools developed their degree structure from grade-taking systems of this sort, as well as the schools of philosophy, guilds (and military units as well, but to a more restrictive extent), and so on. Grade-taking has become an integral part of modern society, being especially noticeable in schooling.

---

[733] Janson, 16:44

[734] Indeed, they are certainly found at many sites of interest

[735] See Rugg

[736] Grade-taking systems are found on the Torres, Banks, Malekula, Pentecost, and other islands, and likely contributed to the worldwide mystery tradition

Similar economic and social practices were widespread among human societies, and likely led to the eventual status of nobility in European societies. In other words, nobles may have developed from something like the Big Men or Kapauku of Melanesian societies, or perhaps from grade-taking, or a mixture of these. Certainly, gifting played a large role in primitive European economies (though they would take a turn in the long run toward capitalism).

Conspicuous consumption, consumption with the purpose of impressing others, as named by Thornstein Veblen, is a longstanding habit of humans, who have long decorated themselves, their homes, their animals, and their possessions with colorful feathers and gemstones, precious metals, and fine craftsmanship. The desire to impress others creates a demand for *prestige items*, items of conspicuous consumption that display one's worth.[737] The demand for conspicuous consumption is created by the forces of sexual selection, which are easily analogized in the "sexy son" or "good genes hypothesis." Richard Dawkins, in *The Selfish Gene*, says about this hypothesis, that

> In a society where males compete with each other to be chosen as he-men by females, one of the best things a mother can do for her genes is to make a son who will turn out in his turn to be an attractive he-man. If she can ensure that her son is one of the fortunate few males who wins most of the copulations in the society when he grows up, she will have an enormous number of grandchildren. The result of this is that one of the most desirable qualities a male can have in the eyes of a female is, quite simply, sexual attractiveness itself.[738]

The peacock, for instance, is a very beautiful bird whose male members have a bright and colorful tail display, which is used for attracting mates. Richard Dawkins and others hold that, though it is costly in terms of energy and individual survival to have such bright plumage, that it is also a display of a healthy immune system. This is similar to explanations regarding the selection of men by women, who are often said to prefer square-jawed men despite the fact that high levels of testosterone are costly to the immune system; suggesting that men who can sustain masculine features such as square jaws have an exceptionally strong immunity, which might be passed on to sons and daughters. These kinds of pressures from sexual selection are used to explain costly genetic traits such as bright plumage and square jaws, but they can just as easily, if not more easily, explain the costs of conspicuous consumption. While conspicuous consumption is, on its own, costly, the capacity to conspicuously consume is a signal of good health and success.

Conspicuous consumption of personal possessions is important to men, especially, because the tendency for women, as suggested by anthropology as well as sex economics, is to select for men based on their status, often tending to marry upward in class status, a phenomenon known as *hypergamy*,[739] though personality and bare prestige may be in competition at times with class in regard to sexual

---

[737] Early on, these were things that were very hard to get, such as shells that had to be claimed from far-away lands or by skilled divers; rare amber, jade, or turquoise; or precious metals that were easily worked and shiny like gold and silver; or fine textiles such as the silks of China. Otherwise, they were surpluses of grains, or livestock such as sheep and goats, pigs, cattle of various kinds, chickens, reindeer, yaks, llamas, camels, or etc. When it comes to items of purely symbolic value, such as kula or wampum, these were often attached to legends, making it a socially-recognized honor to claim them.

[738] Dawkins[2], 158

[739] Women tend to prefer monogamy and pair-bonding because of the rewards that partnership offer them and their offspring, even if partnership with a lower class man. But they prefer to marry upward in class for personal advantage and better chances of survival for their offspring. Oftentimes, in traditional societies, widows of war would marry the headman, Big Man, chief, or etc.

selection. By displaying their status in a tasteful manner, men gain in sexual power.[740] Because of this, items of particularly high status-providing value were traded so widely and on such a common occasion that some economists, as well as anthropologists, have argued that these items are a *medium of exchange*—an item that is accepted in exchange because it is valued as an means of trade— and, in particular, commodity money.[741] *Commodity money* is money that has a widely-percieved or sought-after intrinsic value, or value which is exchanged for its own use. Likely evolving from out of gifts and prestations that were useful but especially which bestowed great status on the holder, as well as from commodity exchanges, examples of commodity money include obsidian, flint, cowry shells, amber, jade, silk, metals, livestock (like cattle, pigs, and horses), animal pelts, salt, and other kinds of widely sought-after goods, especially those that presented the holder with status or were otherwise widely useful.[742] When someone with plenty of cattle is willing to accept a cow in exchange, for instance— in order to increase their social status or especially in order to make exchanges with others—, cattle have become a form of commodity money. A large herd of cattle has been seen in many cultures, but perhaps especially Phoenicians and Indo-Europeans, to be an impressive display of wealth and status. A chieftain with a large herd of cattle might be expected to have a number of wives as a result of his high status.

Unfortunately, the fact that fecundity competes with survival as a motive for human behavior entails that humans, especially men, will oftentimes accept an absolute loss for a relative gain, meaning that they will accept an outcome that makes them less off so long as others are more less off, allowing them to be advantaged not absolutely, but relative to the group. Easter Island may demonstate an example of this in a largely isolated setting. The Easter Islanders' society collapsed due to deforestation and loss of resources, seemingly having had collapsed very quickly, as explored by Jared Diamond. Sociologically, such abuse of resources can generally be assumed to occur due to negligence or greed enabled at the top of society by officiated roles such as *chief*. Such chiefs, in their determination for relative gains, oftentimes cost the society in a more absolute sense. In this case, there seems to have been a greedy drive for more palms than the island could continue to provide in order to build structures. This was likely a concern to those harvesting the palm lumber, who would be quite aware of the rate of depletion. But political authority rarely listens to reason that does not advance its relative interests over the people over which they rule, and in the case of Easter Island it caused an absolute loss in the form of the collapse of an entire society.

Some commodities— especially prestige items, desirable materials for the making of tools, spices and salt and medicinals, and others that were not commonly available— became so widely exchanged that they became staple items along long-distance trade routes. Among these were the Jade, Amber, and Silk Roads. Jade, an important green rock that could be carved and served as a status symbol since the time of the Denisovans, was especially traded from the Phillipines, the Tarim Basin, and China to the rest of Eurasia and North Africa. New Zealand is an important source of jade and serpentine in Maori and Moriori culture. East of the Tarim Basin was the famed Jade Gate or Jade Pass. The Amber Road extended especially from out of Scandinavia, though other sources of amber—a golden gemstone of petrified tree sap—, especially *faux* amber, also existed. Silk was traded along the Jade Road, essentially taking it over, but also along the Maritime Silk Road, which made use of the Indian Ocean, the Red Sea,

[740] Conspicuous consumption faces competition from those who reject the costs as wasteful, however, and who make the assertion of such values sexually-appealing. Women also find strong-willed, moral men to be sexy.

[741] Others, however, argue that some of the cultures exchanging these items did not unanimously accept them as currency, and that these items are better treated as high-velocity barter items. States such as New England and North Carolina accepted wampum as legal tender for some time.

[742] They are considered "commodity money" particularly when they are so widely sought-after that individuals without a direct use for the commodity, who see its demand by others and recognize its exchange value, are willing to accept it in an exchange

and the Mediterranean. Tyrean purple, coming from Phoenicia, would become especially important to the royalty of Europe in later ages. Cowry shells and other items also had a wide exchange range. All of these items were luxury or prestige items. There were some practical uses for many of them, but for the most part the driving factor behind them was a conquest for status. What was being exchanged, then, was not just goods, but, more importantly, social status. Status was important for acquiring the most desirable mates, and sometimes multiple of them, but also for the sake of social power, influence over others of the same sex—with whom one often competed with over mates— which would also contribute to the longevity of one's lineage. It must be remembered that all human decisions, as with all organisms, are founded on the drive for survival, particularly the survival of one's genes, so people will tend to make decisions that enable them to increase their fecundity and to preserve themselves and especially their offspring. Aquiring desirable mates and gaining social influence are two of the most important ways to achieve these outcomes.[743] For this reason, intraspecific competition, especially between males, is often much more fierce than interspecific competition.

Eventually, largely as a result of sexual competition, and the use of coalitions using force and religion to gain an advantage, class systems would arise, and with them the return of polygyny, often taking the form of polygamy (multiple wives), but sometimes of (in terms of millennia) increasingly large harems (sometimes wives, typically concubines). Whereas hunter-gatherer men rarely went wifeless because of the extra wives claimed by a headman—usually widows of war or hunting—, the emerging caste and class systems would leave many men without wives, or otherwise unable to exercise any meaningful sexual selection.[744, 745] *Patriarchy*, or the "rule of father,"[746] would accompany polygyny, and would become especially potent in combination with private property rights and *gynocentrism*— a focus on the wellbeing of women and attention to their needs—, resulting in *gynocentric patriarchy* (much of the drive for political power by men is for the sake of gaining the favor or control of women in the first place). Through the use of private property, and in particular a son's inheritance to it, a father could control a son by threatening him with the loss of his inheritance. Fathers without private property to pass along have a much more difficult time controlling their children, and arguably have a difficult time establishing themselves as patriarchs with any considerable, unwarranted control over the rest of the family.

The first people to have been buried with gold treasures, and the first known to have had hierarchical burials, in the West, were the Neolithic *Varna* people, a people in the area that would become Thrace. The amount of gold buried with single individuals in their graves at the Varna Necropolis, interpreted to be either chieftains or goldsmiths, is more than entire regions put together. The Varna people, who are also loosely associated with *kurgan burials*—burials in mounds sometimes called *tumuli*—, lived near Solnitsata and Anhialos, in what has been claimed to be Europe's oldest town, where they maintained a salt monopoly, trading with people such as the Cyclopians (who traced their heritage back, at least in part, to the giants), using shell money. The most impressive burial, with the most gold, includes an individual wearing a gold penis sheath, not unlike the sort that one might find among people such as

---

[743] However, society can be said to enable this behavior as well, something that could possibly be different in the future

[744] This resulted in a decrease in, by way of an opportunity cost to, the quality of the species

[745] Today, many men go without wives still, often because they do not have the status to attract women, such as by having an official education, a high-paying job, property, or etc. This is especially a problem for lower and lower-middle class men. The growing sex industry, including peep shows, strip clubs, pornography, and prositution cater especially to rich, oftentimes married men, an example of polygyny returning.

[746] Some think that *patriarchy* means "rule by men," but that is mistaken. It is only "rule by men" so far as men are, or have the capacity to become, fathers, and especially fathers of a tribe or inheritants of the title to tribal leadership.

the Kapauku, though their penish sheaths are not made of metal but out of gourds. The Varna are said to have had afterlife beliefs because of their burials. Their town (perhaps towns) is said to have been destroyed by a natural disaster, not unlike the fate suggested to have occurred to Sodom and Gemorrah, perhaps. They may be of some relation to the Nesiotids, Melanesids, or another Polynesian group.

Newgrange, a Neolithic site in Ireland that is aligned to the Winter Solstice, is also characterized by the appearance of a strong hierarchy, perhaps even involving a "god-king," as suggested by the degree of inbreeding found in royal specimens, likely involving incest between siblings in an effort to preserve a paternal lineage. This is not at all unlike the royalty of Ancient Egypt, and was perhaps part of a larger cultural complex in which both the Neolithic Irish and the Egyptians took part.[747]

Leagues, Political Agonism, and Co-option

The return of inter-human political hierarchy was established by way of the league structure, through early developments in political agonism and co-option.

Leagues are distinct forms of human organization. Distinguishable from confederations, though sometimes growing into or being elements of them, leagues imply a greater degree of disagreement and competition than may typify *confederations*, which may be considered league relationships plus some element of mutual aid, such as intergroup trade relations, shared control, disaster relief, or military support. In a league, the focus is not on mutual aid, but instead on mutually-tamed animosity, often being hierarchical in interpersonal organization.

Perhaps the best way to understand a league is to consider what a league is when found in civil society today, most notably in sports or business. In sports, for instance, a league is an association of teams that have come together under a common franchiser for the purpose of competing according to standardized rules and procedures relating to the franchise. In this case, it is a form of friendly rivalry, though the rivalry has gotten serious a number of times. Similarly, business leagues are efforts of coopetition or cartelization, wherein competing entities come together, or cooperate, for the purpose of supporting a market in which they otherwise may mutually compete. Leagues officiate conflict and add a collaborative element between competitors.

The *modus operandi* of a typical league structure is that of political agonism, an expression of biological agonism. *Agonism* comes from the Greek *agon*, which translates to "assembly" or even "sports." It specifically refers to an assembly for sportsmanship, in which that which is valued is not so much the victory of one of the competitors over another, but the sense that there has been a good match with opponents worthy of one another, who try one another's abilities. Agonism is connected to a sense of good sportsmanship and to the mutual tending to common rules of conduct, despite the animosity that might exist between participants. Agonism in the league form might be understood to change enemies into adversaries or "frenemies." In this way, it can be distinguished from antagonism.

Agonism in the political sense demands a plurality of participants, each serving their own agenda, in a war of all against all, and each against each.

Resource partitioning describes agonistic behavior in animals related to the divvying out of resources between them. Similarly, political agonism depends upon the maintenance of borders. Both result from scarcity of resources, or demands being higher than supply. It is a means of sorting out who gets what, often by reducing violence to its minimum. Within the organized conflict of a league, it is well

[747] Indeed, many have spoken of Egyptian origins for the Irish, or at least their ruling class

understood that the terms of engagement are that one can win, and that the stakes are winner-takes-all, but that one cannot win for the rest of time. Similarly, a young buck can try again next season against this season's victor, and upon winning takes all for himself. To the political agonist, the league is an arena of competition that is to be valued for its own sake, with agony valued as a good not to be messed with. Anyone who disrupts the overall balance that keeps the agony going is to be targeted and neutralized. Deliberation and rationality are to be devalued, except as tools of belligerence in the organized conflict.

Internally, leagues recruit according to what is called *co-option* or *co-optation*, sometimes spelled without the hyphens. Co-option involves the— often involuntary— incorporation of opponents who are acknowledged for their skills or know-how and, upon the grounds of their expertise or status, are accepted within the bounds of a specific role, wherein they hold some limited authority. Everyone "stays in their own lane." This is known as *compartmentalization*. This is often an effort to reduce competition or competitiveness by providing a stake in one's own team to one's opponent. This often does not come with voting rights, and is often not an equal stake, and so the stake cannot be confused for a share of overall control, just influence and rights to play the game according to the rules. While this does represent some degree of mutuality, it is very agonistic, and certainly falls short of full co-operation, though it is certainly within the range of biological social behavior.

Co-option and compartmentalization further involves the defanging of one's opponent by incorporating them into the team and establishing the boundaries within which their time may be focused, without allowing them the means to change their condition. This also allows for what is called the *framing effect*, the idea that concepts can be "charged" with a negative or positive connotation according to how they are perceived, especially as influenced by the manner of delivering the message. Co-opted individuals are often limited from delivering particular messages, being restricted to a certain manner of framing by their superiors, often indirectly by way of custom. Their messages, instead, contribute to an underlying theme that establishes a paradigm which keeps the ruling class intact by customarily preserving its league structure.

Among some of the Uto-Aztecan peoples, most notably the Aztecs themselves, leagues were formed for the purpose of carrying on *Flower Wars*, real wars that followed strict rules of combat that restricted certain actions typical of normal warfare. These Flower Wars were carried on under the premise that, after being struck by a drought, the gods required mass and ongoing sacrifice, to which the parties of the conflict involved in the leagues of the Flower Wars agreed. So they started to follow rules of combat that resulted in the taking of captives for sacrifices.

League structures may have begun in the Americas in California or Mexico, though Russia or the Bering Strait area is another possible location, as well as Polynesia, Sumer, Anatolia, Egypt, or Israel. These are all important geologic and historical locations for the flow of trade.

By establishing a league, or partaking in one, even though one was still in competition with the other participants in the league, and even had to risk being sacrificed, one was still part of the "in group" that was fostering the coopetition, and so was still, in a sense, cooperating with one's opponents against further outsiders who were dealt with without legal standing. When cooperation became recognizably true and well-established, leagues would develop into formal confederations or alliances, where mutual aid would begin to take place between societies. There were mutual stakes in establishing a league structure where the economic rent, or yield on the land, was high due to economic traffic and population settling.

League structures, co-option, and agonism might be seen as efforts of harm-reduction or negative entropy (not to be confused for syntropy). While the Flower Wars and other forms of organized conflict have resulted in human sacrifice and even cannibalism, they are also characterized by increased civility in times of peace and even with the beginnings of what would today be considered international law, a favorite among elite humanitarians and peaceniks. This is, of course, fueled not so much by a social purpose as by self-interest in "the game," but its eugenic results have been duly noted by ethnoreligionists and have, in this way, become associated with tribal purposes and, in this way, with a limited sort of philanthropism that may or may not stop at the fringes of the tribe itself.

The social Darwinistic or eugenic forces at play in the leagues favored the competitive, cunning, and capable. League structures would establish systems of coopetition, wherein participants would compete according to agreed upon standards of relation. Being limited, then, from the ability to cheat or swindle, they had to learn to fill societal roles, and those who did so succeeded. Those who did not were allowed to fail, or, in the case of the Aztecs, were even sacrificed.

Caucasoids, Mongoloids, and Americanoids

Races are not matters of common descent alone, but involve the convergence of descent groups along environmental clines that select from among those lineage groups, thereby causing differentiation even where geneflow is present. Racial groups like *Cro-Magnoid* and *Mediterranoid* represent the convergence of groups and hybridization of them, for instance, whether *Homo heidelbergensis* or *sapiens* in origin. Commonalities result from such things as having a common substrate, common lineage, or common environment. This produces *races*, which are loose groupings of people who might be familiar to a particular area, but who do not necessarily belong to the same lineage, though they will often have some relation to others by way of a superstrate that was established by a conquerer who established themselves as a ruling class, thereby binding the conquered together under his lineage and creating a common identity as a people, despite their otherwise convergent or hybrid origins. This is why it is impossible to nail down a single location for the development of a particular race, a race being composed of genetics sourced from different homelands. Nonetheless, it is possible to suggest, with some accuracy, important points of dissemination that were particularly influential. For the Cro-Magnoids this was Iberomaurusia and the Canary Islands, and perhaps Scandinavia, as well as India, Indonesia, and West Asia, wherefrom Australoids, probably especially albinos, made their treck up what would become the Jat Belt (the stretch of land from Indonesia to Scandinavia). Some of the genes from Java Man, *Homo floresiensis*, *Homo luzonensis*, or etc. may have travelled up the Jat Belt to Cro-Magnoid, but otherwise may have come from the direction of South America and into Mauretania, spreading to Cro-Magnoid by way of France and Iberia. Cro-Magnoid, then, would be to the Mediterranean race what Mechtoid is to the Berber people, or what Natufians are to Caucasoids, a prototype of sorts. The Mediterranoid race seems to have developed as a maturation of the process, with Cro-Magnoid having been proto-Nordid (such as a Guanche), and Mediterranoid having been the one-time culmination of the process, later surpassed by Nordids-proper. This would make the Cro-Magnoid, Mechtoid, Mediterranoid, and Nordid a *chronorace* of sorts that develops along clines of convergence, or perhaps something like a *ring race*, analogous to a ring species (wherein subpopulations are established along a cline).[748]

[748] Race is particularly difficult to ascertain, because the lines of division are largely arbitrary.

Early Caucasoids[749] were produced when the Omoid-derived Levantoids, Native European Cro-Magnoids, and later Mediterranoids (and some Capoids, Mechtoids, and Australoids) in the Caucasus had mixed with Lappoids and Neanderthal. As the name suggests, Caucasoids are found in and around the Caucasian Mountains, though the term is often used interchangeably with *Indo-Eurafricanoid*. Because the Caucasoids had contact with so many other peoples, however, they could mix with them, contributing to an advantage. Coon says that

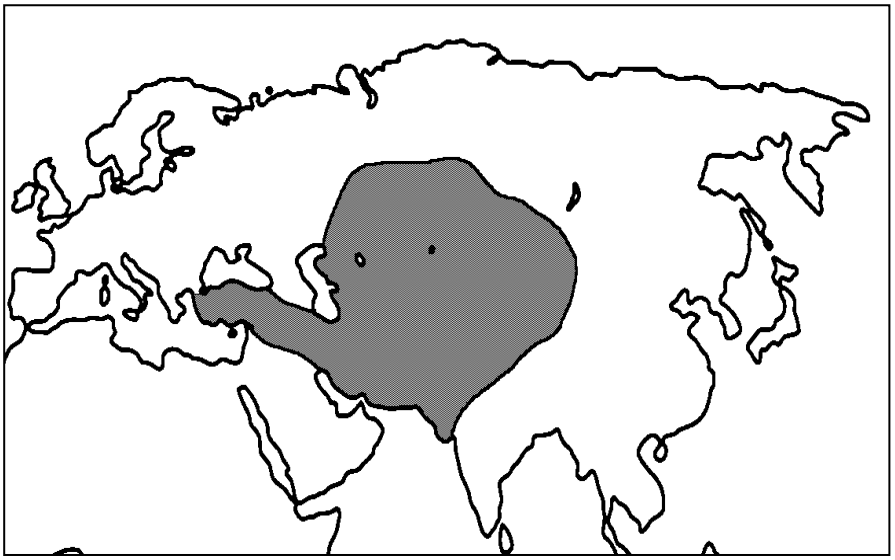
> The ancestors of the Caucasoids who, as we suppose, evolved there could have been in direct peripheral contact with frontier populations of three or four other subspecies: the Australoid in India, the Capoid in North Africa, and possibly the Congoid in Southern Arabia if not also in Africa. The Caucasoids did not have a common border with the Mongoloids, however [...][750]

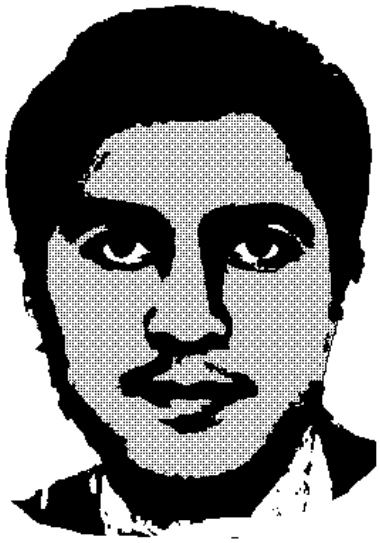
As a result of this, Coon tells us that

> If a skull now and then turns up among [the Caucasoids] which looks Negroid, Australoid, Capoid, or even Mongoloid, we should not be surprised because owing to the spatial position of the Caucasoids, in the middle of the Old World land masses, they should have been the least "pure" of all human subspecies.[751]

Perhaps the purest form of the Caucasian is found among the Georgians or Kartvellians of the Caucasus, Armenians, or others of the Armenid subrace of Caucasoid, possibly a result of especially Natufian, Zarzian, and Lappoid convergence with Neanderthal. From the Caucasus, especially, Caucasoids emanated especially across Eurasia.[752] Caucasoids that went Eastward and Northward into Central Asia would, along with their predecessors (Lappoid and Basal Eurasian), be called *Turanids* and Westward would primarily be called *Alpinids*, each a phenotypic deviation from these early Caucasoids. However, there are some Alpinids to also be found in Western and Central Asia, such as Tajiks, who have fully not diverged toward a Turanid phenotype, representing either more recent arrivals or an alternate point of origin for the Alpinids, perhaps representing a proto-Alpinid. The Alpinid-Turanid spectrum spans from Alpine Europe into Turan, or Iran, with the Caucasoid representing a central, emanating point. Both the Alpine and the Turanid are proto-Caucasoid in origin, with Caucasoid-proper, represented by Armenians and Georgians, being a local development from this shared foundation.

[749] Or proto-Alpinids, Proto-Armenids, etc., and here including groups such as the West Eurasian, Caucasian Hunter-Gatherer, Ancient North Eurasian (proto-Turanian), Western Hunter-Gatherer (Cro-Magnoid)
[750] Coon[1], 485
[751] Coon[1], 486
[752] And then eventually, come the Age of Discovery, the Americas and Australia





Turanids evolved in the Ural-Altaic convergence zone and Southward toward Iran, and are often said to be distinguished by being *brachycephalic*, or "round-" or "short-headed," in comparison to the more *dolicho-* or *mesocephalic*, or "long-" or "medium-headed," Nordid and Mediterranoid peoples. Brachycephaly is something that is shared with the Mongoloid (while the Congoid and Capoid tends to similarity with the Nordic and Mediterranean in having a longer head). Turanids are likely a mixture of the Lappoid and the Basal European or Mediterranoid race, perhaps having some ancient Polynesid in its Southern populations, sometimes considered to be *Orientalid*, especially prevalent in West Asia and the Mediterranean, often categorized with Mediterranoids. Turanids had begun to develop Asiatic features, such as almond eyes with folds or hoods, features that would be shared with proto-Turanid Lapps and Finns, and which would be passed along to Mongoloids in East Asia as well. This may or may not have been acquired by contact with Capoid. There are some— following William Matthew Flinders Petrie, Laurence Waddell,[753] and Walter Bryan Emery's ideas— who hold that the Turanids, or else Orientalids, compose a *dynastic race*, a race that was responsible for the formation of dynastic rule, especially as would be imported into Egypt from out of Mesopotamia, especially Sumer. According to some versions of this view, Turanids had been the first true rulers in the Cradle of Civilization, forming themselves as ruling families or dynasties over others. They would, however, be followed by Aryans and then Nordids in this role.

Max Muller placed the "Cradle of the Aryans," referring to Indo-European speakers, in the general area of Iran, Afghanistan, Pakistan, and India, especially surrounding the Hindu Kush Mountains and the Alpine-Himalayan Volcano Belt more generally. This would later be termed the *Cradle of the European Races*, referring to the Alpinids, Mediterranoids, and Nordids. Muller made clear later on, when his concept became racialized, that *Aryan* was an ethno-linguistic and not a racial term. Individuals of any race could be Aryan, so long as they spoke an Aryan tongue. Regardless, the tendency has been to ethnically associate race and language despite his protests. The Eastern branch of the Mediterranoids, Huxley's *Melanchroi*— Dravidians— perhaps accompanied by proto-Malays or Polynesians, would be understood to have traversed into Europe especially along the South of the Volcano Belt. The Alpinids converged along it, dividing the Mediterranoids from some of their kin to the North who would tend to take more to the route along the old Jat Belt between the Caspian and Aral seas and up into North and

753 "Indiana Jones"

Western Europe. There would be, of course, considerable mixing as boundaries were crossed by military expeditions, tradesmen, explorers, and etc. Alternately, Carleton Coon suggests that the Alpinids may also represent relict Cro-Magnoid populations. Rather than a strict emanation from the Caucasus, then, we might consider the Alpinids to have converged along the cline related to the Alpine-Himalayan Volcano Belt, which extends from the Hindu Kush to the Alpines of Europe. Often considered distinct from the Caucasus, this might distinguish the Alpinids from Caucasoids such as the Armenids (though less so the Georgians, associated themselves with an Alpinid phenotype).

As *Alpinids*,[754] the early Caucasians would become known as the *Neolithic Farmers*. Jan Czekanowski considered the Alpine race to be something of a mixture between the Lappoid and the Armenid (here considered to be Caucasoid-proper). This is probably fairly correct, though with some Mediterranoid as well, perhaps a later addition or stemming from another point of the cline. The Alpinid is typified by light and sometimes ruddy skin, light to dark blonde, red, or brown hair, and green, hazle, or brown eyes. Carroll Quigley was interested in these early Caucasoids, whom he said were "now linguistically extinct and they appear to many as of little historic significance." Of these, he says that they are "the agglutinative-speaking Alpine peoples of the Highland Zone," having especially settled around mountain edges. "This group," he says, "which usually receives only passing references in most histories, are, in fact, the most important group of humans who ever existed." Further,

> They were the inventors of agriculture as we know it, using the same crops and domestic animals we have today. They were also the inventors of metallurgy (copper, bronze, and possibly iron) and were the founders of the first civilization, in the valley of Mesopotamia.[755]

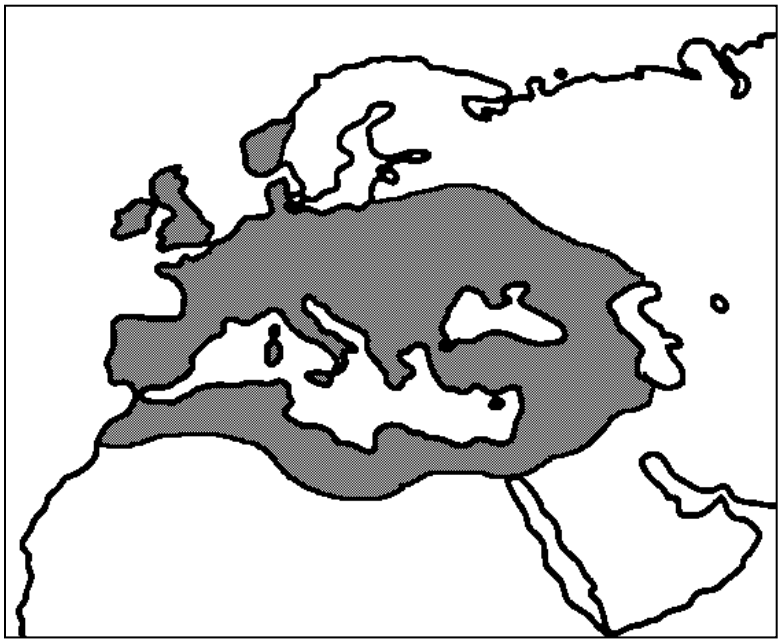
The Alpinid, an albinized and Neanderthalized Mediterranoid and Lappoid, is the standard of the Neolithic European. Quigley suggests that some of these Alpine people, who had involved mixing of *Homo sapiens* with Neanderthal, had settled around the mountains to farm along the edges, where the water would run off of the mountain and onto their lands. These Neolithic farmers, as you can see, Quigley attributes with the foundation of what would become civilization. The Polish nationalist and amateur anthropologist Stanislav Szukalski, and altogether a quite sloppy source of information,[756] wrote virulently of the *Yetisyn* (or *Jetisyn*), or "sons of the Yeti," which he believed to have been responsible for what he understood to be the cultural decay of Poland and, by extension, basically the rest of the world. Clearly, by his descriptions, the most obvious racial group he could have been speaking of was the Alpine people, as Ben Hecht apparently also noticed, though inconsistently and often by taste, with much focus on facial features. Interestingly, the Yetisyn idea seems to correspond to the notion of Quigley (as well as Coon and others) that the Alpine people had intermingled with Neanderthal, if we take *Yeti* (or, in some versions, *Jeti*) to refer to Quigley's Neanderthals. I'm not sure how dolichocephalic Neanderthal is supposed to have contributed to a brachycephalic Alpinid, unless starting with a basal Cro-Magnoid or Mongoloid stock, or else if Antonio Rosas and Markus are correct about Apidima 1 representing a brachycephalic Neanderthal, but it is nonetheless commonly considered true that brachycephalic Alpinids nonetheless had much Neanderthal admixture. Further, Halfdan Bryn performed a Mendelian analysis regarding the passing of traits related to skull shape and eye color in

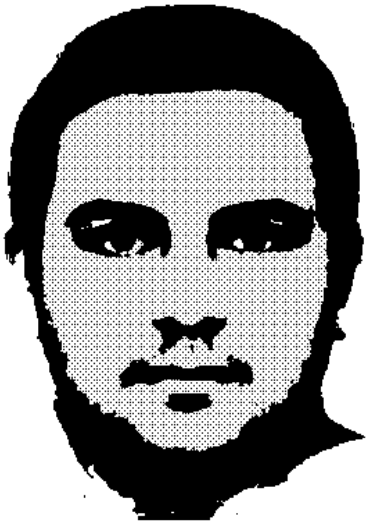
754 The images of Alpinid, Turanid, Mongoloid, and Americanoid are derived from images at humanphenotypes.net

755 Quigley, 193

756 Most his writing were artistic instinct and useless banter, overall, rather than scientific or philosophical. If there is any redemptive value in his many volumes, they are simple nuggets of common sense observations that have been mixed with a greater degree of Romantic sentiment. Please approach readings of Szukalski with much reservation.

Norway, concluding that the Alpine people there were actually dolichocephalic, the Nordic people were mesocephalic, and the Cro-Magnons were brachycephalic.[757] Bryn concluded that the human skull, even as inherited from parents, was greatly variable, and that racial differences were not themselves strictly cephalic, but that the cephalic index is instead associated to the races by representing a sort of average in the race. As such, we can expect individual and even collective outliers in given populations, which, if isolated, could potentially lead to divergent evolution. Szukalski, of course, traced the Yeti influence to the Himalayas, to the Abominable Snowman, which would correspond to the idea that the Alpinids spread along the Himalayan-Alpine Belt. If we take *Alpine* to be a reference to whiteness, or *albino*, we may consider that the white skin of Alpinids may come, in part, from the Abominable Snowman, or an ancestor thereof.[758]





Otzi the Iceman is an Alpine Caucasoid who was murdered and left to become a well-preserved ice mummy. His makeup seems to have been a mix from Alpine people-proper and a Swedish hunter-gatherer, his skin white. Otzi's mother's line originated locally in the Eastern Alps. Sarah Griffiths, in "The mystery of Otzi's wandering father: Famous iceman's parents came from two different parts of Europe and may have had a fling in the Alps," writes,

> Putting the pieces of the genetic puzzle together, the researchers think Ötzi's paternal lineage is part of an ancient genetic line that arrived in Europe but originally came from the Near East with the migrations of the first Neolithic peoples some 8,000 years ago.

[757] This runs counter to the notion that the Nordic people were dolichocephalic, while Alpines were brachycephalic. However, at this time, what constituted dolicho- and brachycephaly was under debate, with conceptions having some overlap, and Bryn clearly used traits outside of the common cephalic index to distinguish Nordics from Alpines.

[758] Further, there may be connections outside of the Alpine race to the Yeti, such as the possible connections with ethnic terms such as *Jat* or dialects such as *Yiddish*. Jats, in particular, average out to be mesocephalic, with outliers to each side, suggestive of a mixed population. *Yids*, or Ashkenazi Jews, are generally classified as brachycephalic, while their Sephardic counterparts are at times counted among the dolichocephals, though more recent attempts try to define Jews as more generally brachycephalic. Nonetheless, there are certainly dolichocephals and mesocephals present among world Jewry as well, as Jews are a highly-mixed people.

This suggests his father came from a line of travelling farmers.[759]

Otzi's parents likely met in the picturesque landscape of the Alps. The farmers coming from the Near East are likely to have been from the Levant or related to those who had come from there.[760]

Sarah Sloat, in "Ancient Skulls Show How Early Humans First Made It to Scandinavia," writes that, in Scandinavia, "ethnically distinct groups start fraternalizing with one another, and then their combined genes is what allowed later generations to thrive in the region's extremely cold environmental conditions."[761] Once there, Sloat points out, these Scandinavians, converging from Southwestern (probably Cro-Magnon, Capoid, maybe Polynesian or Mechtoid) and more Easterly sources (proto-Caucasoid, proto-Australoid), became adapted to the cold. This adaptation is still reflected in the blonde-haired, blue-eyed inhabitants there today; though these traits may have solidified later, especially with the appearance of the Nordid race, likely a combination of these locally-adapted Northwest Europeans and albinos (Mediterranoids especially, but also Negroids, Caucasoids, Alpinids) coming from out of Eurafrica, Eurasia, and India, perhaps even Indonesia. The tendency in Scandinavia would be for light skin to be favorably selected by nature, while dark skin was deselected over time.

Whether Scandinavians of the time also had light skin is a matter of debate, though the DNA of a Danish girl called *Lola* who has been reconstructed by the technocracy is shown with blue eyes and Austro-Melanesian[762] characteristics, and the Oase remains—a cross between Neanderthal and *Homo sapiens*— has been reconstructed to have very dark skin and blue eyes. Cheddar Man, the hunter-gatherer in England, is also reconstructed with very dark skin and green or blue eyes in later models.[763] The hunter-gatherers— unless we are being lied to for purposes of cultural Marxism— often shared dark skin, a common trait with their Australoid kin in India and South Asia, Southern Eurasia, and possibly North Africa. This is, if we take the techno-managerial class's word for it, the typical form of especially the more Westward hunter-gatherer, though, if so, this may not be including Cro-Magnoid proper, who is related to the Guanches of the Canary Islands and to various relict populations such as Borrebies and Brunns in Northwestern Europe. Neanderthal and Denisova are also understood by some to have had dark skin. The Ust'-Ishim Man fossil revealed that *Homo sapiens* in Siberia also had dark skin and possibly blue eyes. Still, some of the Scandinavian Hunter-Gatherers, we are told, show some signs of skin depigmentation, suggesting that there may have been lighter-skinned individuals. These populations are understood to have been derived from Eastern and Western Hunter-Gatherers that were themselves derived from Cro-Magnoid, Capoid, Alpine, and proto-Armenid Caucasoid stock, along with Ancient North Eurasians (in part derived from Ancient North Siberians, possibly Naacaloid relatives of Cro-Magnoid mixed with Cro-Magnoid and Capoid), basically Lappoids. Cro-Magnon and the Caucasoidal Caucasus Hunter-Gatherers may have developed light skin, or depigmentation, on their own,[764] and Capoids can have light skin themselves. Some of the Eastern Hunter-Gatherers, a mixture of Capoids and Cro-Magnoids who would contribute genetics to the Sami and Finns and other Baltic and Ural-Altaic peoples derived otherwise from Ancient North Eurasians, tended toward skin depigmentation as well, though this is especially so after exposure to *Neolithic*, or "Late Stone Age," Alpine and Turanian farmers coming from the Levant. Hair color among the hunter-gatherers, perhaps

[759] Griffiths
[760] The Levant is one of the most important places for history on Earth, because it is the Cradle of Civilization
[761] Sloat
[762] A dark people sometimes known to have blonde hair
[763] Earlier models depict an Alpinid-like man, which may be correct
[764] Though this does seem unlikely considering the likely placement of the equator at the time

due to admixture with Neanderthal— or *alpinization*[765]—, was variable much as it is today in modern humans. The inland Celt and the Slav are typically Alpinids, as was noticed by Paul Broca.

In Eastern Asia, Australoids had established themselves especially in the South, where vitamin D from the Sun was plentiful, and along the coast where seafood provided sufficient supply. Various local races to East Asia appear who have baffled anthropologists. The Jomon and Ainu people of Japan, for instance, appear to have some similarities with the Sami, but sometimes also with Australoid, being classified variously, often as Caucasoids. The Munda people appear to display a unique phenotype at times, variously showing Levantoid, Australoid, Mongoloid, and possibly Negrito features. *Negritos* themselves are black people with features similar to or in common with Negroid people South of the Sahara, including skin tone, hair texture and color, and some facial features, much more so than Australoids, whom they are generally classified as a subtype of. However, unlike their African counterparts, these Asian black people have wide instead of long skulls, more in common with their Mongoloid neighbors. Whatever the case, they are generally considered to be Australoid subtypes with some admixture with local populations. Other peoples exist, especially among the indigenous hunter-gatherer populations, such as the Semang, another black population in Southeast Asia that appears to have African characteristics, but which are generally considered to be, like Negritos, Australoid.

It is the Mongoloid, however, that has become dominant in East Asia. *Mongoloids*, colloquially referred to simply as *Asians* (though there are many non-Mongoloid Asians!), are found spread across East Asia from centers[766] especially surrounding Mongolia, China, and South Asia. Like Caucasoids, Mongoloids had an exceptionally good place to evolve in. On the reason for the prevalence of Mongoloid and Caucasoid phenotypes, Coon suggests that

> Caucasoids and Mongoloids who live in their homelands and in recently colonized regions, such as North America, did not rise to their present population levels and positions of cultural dominance by accident. They achieved all this because their ancestors occupied the most favorable of the earth's zoological regions, in which other kinds of animals also attained dominance during the Pleistocene. These regions had challenging climates and ample breeding grounds and were centrally located within continental land masses. There general adaptation was more important than special adaptation.[767]

He further says that

> This geographical situation gave the Mongoloids the isolation necessary to retain their extreme racial peculiarities while evolving from a lower to a higher grade. At the same time it placed the Caucasoids in a central position in which they could accept

[765] Alpinization is likely to have itself been a converging phenomenon, occurring many times, before hybridization between hybrids solidified the various ethnic groups into a worthy racial or subracial distinction. Nordicization is likely to have similarly involved convergence and hybridization, but between various manifestations of Mediterranoid and much less with Australoid (although Mediterranoid likely has an Australoid substrate to it already) and Neanderthal.

[766] Mongoloids may have multiple points of convergence. The proto-Mongoloid might be associated especially with the Mongoloids of Southeast Asia, and may or may not include the proto-Malay, variously considered an offbranch of proto-Mongoloid or as a separate race altogether. Along with these potential locations of Mongolo-genesis, later Mongoloids associated especially with Turanian roots might have developed in China and Mongolia-proper. The Sinid might be considered either a Northern Mongoloid or some early offbranch from what would become the Northern Mongoloid or Mongoloid-proper, perhaps a Middle Mongoloid. In this way, the proto-Malay, proto-Mongoloid, and Mongoloid-proper might compose three or more major subraces of Eastern Asia, or of Mongoloids, similar to the Mediterranoid, Alpinid, and Nordid subraces' interrelations in Europe.

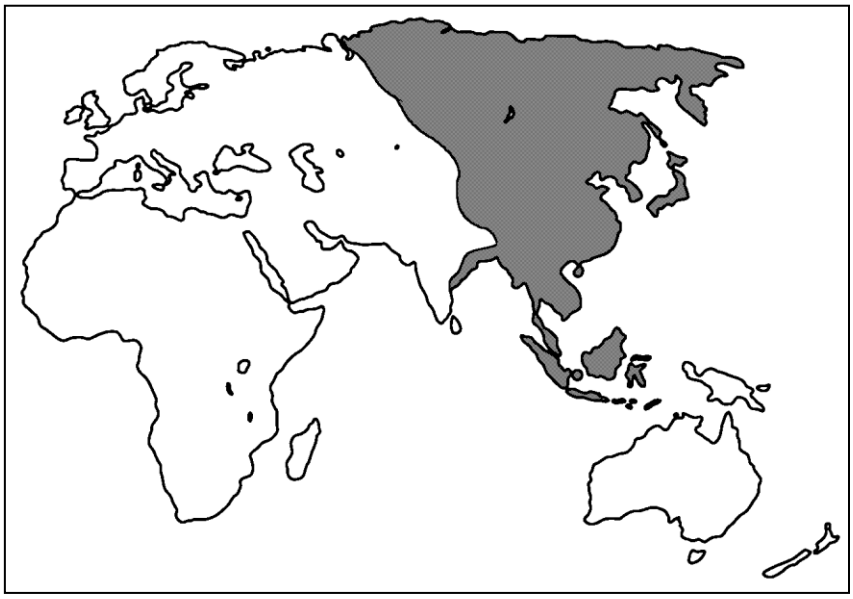
[767] Coon[1], 663

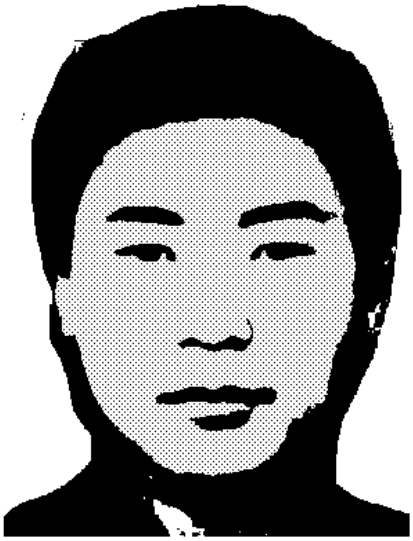
> genes directly and simultaneously from the three other subspecies; process these new genes by exposing them to natural selection for climate and culture, in a zoologically central area; and pass the product back to the peripheral populations separately. In the same way, to a correspondingly lesser extent, the Mongoloid could deal with Australoid genes [...][768]

It's interesting that Coon points out the fact that the advantageous ecological setting of the Caucasus and Southeast Asia meant that Caucasoids and Mongoloids benefitted from becoming genetically generalized rather than specialized. Generalization contributes greatly to success, and Coon is suggesting that environments that favor generalization are better than others. Coon also points out, however, the capacity of other races to catch up, evolutionarily speaking,[769] despite these advantages, thanks to the development of economic capital that has been spread to the other races. This makes immediate environment less of a determining factor, and even allows for it to be changed in significant ways. Coon says

> Any other subspecies that had evolved in these regions would probably have been just as successful. Now the success of these groups is being challenged in many parts of the world as other groups who evolved later learn to use their inventions, especially modern means of communication. And evolution is still taking place, particularly natural selection resulting from crowding and stress [...][770]

Nonetheless, the Caucasoids and the Mongoloids had the most favorable area of habitation for the longest time.





[768] Coon[1], 485

[769] This would become especially important for later Congoid phenotypes, which Coon suggests really started to appear as *Homo sapiens* sometime around the Iron Age, passing the milemarker and evolving away from stages of *Homo erectus*. While early humans were almost certainly black, these were not black Congoids, but black Omoids, Levantoids, Australoids, and Elamo-Dravidians (mixed Australoid and Levantoid deviating toward Cro-Magnoid). Nonetheless, black African Congoids have joined the rest of humanity in sapience. Coon points out that, in places like the United States, blacks and whites cohabit space largely sympatrically, perhaps suggesting some sort of co-evolution now at play, perhaps operating along the lines of *coopetition*, or competitive cooperation.

[770] Coon[1], 663

Mongoloids come in a number of possible subtypes, but especially and typically divided into a Northern and a Southern type, the Northerly variant having lighter skin and the Southerly being darker, among other minor differences in their phenotypes. It is the Mongloid-proper which gives their name to the phenotype, exhibiting the greatest contrast with other groups, perhaps, owing to particularly pronounced cheekbones and slanted (not just almond) or monolid eyes that provide an advantage when facing the Sun's glare from off of snowy tundra or sandy dessert, common to Mongolia. Other "Mongoloids" also have pronounced cheekbones—indeed, the Red Deer Cave People show this to be so early on— and comparably Asiatic eyes in comparison to Europeans, even if not quite "slanted," being almond instead.

Much localized evolution in South Asia occurred around the time of a declining Cro-Magnoid in Europe, in a population generally called *South Mongoloid* (but that bleeds into the North as well) or *Sundadont*. Some of the South Asian "Mongoloids" included Daic speakers whose culture had emanated Eastward, perhaps from the Caucasus, toward Tibet and China, becoming the Sino-Tibetans— most influentially, perhaps, the Chinese—, but who would also continue into Southeast Asia where they contributed a superstrate to the Austroasiatic languages and Austronesian—collectively, Austric— languages. Some of them would move Northward, too, joining the Uralic peoples, or Westward, where they joined the Cro-Magnoid Vasconic speakers. Those who went furthest East, suggests thinkers such as Quigley, would pass the Berring Strait, joining the American Indians as Na-Dene speakers (though I think it may have happened in the reverse, perhaps also, as in an exchange). Other agglutinative languages would also find themselves in the Americas, including the Aleut-Eskimo, Na-Dene, and Amerind groupings.

Near the Ural Mountains, Lapps started to independently acquire Mongoloidal or Asiatic features, sharing in common with proto-Mongoloids of Southeast Asia, who had also aquired such features as an almond-shaped or slanted eye.[771] Some of these proto-Turkic peoples would travel to the Altai mountains, and from there throughout Siberia and North Asia (and also toward Scandinavia), such as around Lake Baikal, where they would undergo greater processes of Asiatic adaptation, becoming through that adaptation as well as by interbreeding with paleo-Mongoloids and some Australoids, light-skinned "neo-Mongoloids" of a *Tungid* subvariety. Full Mongoloidization involved not only divergence from the proto-Turanid line, but also much local convergent evolution taking place (especially in East Asia, from which much of the Mongoloid phenotype originates independently from Caucasians) and involved strong forces of local adaptation. Further, some of the neo-Mongoloids would either adopt or bring with them non-Altaic languages, speaking instead languages such as Sino-Tibetan, from the Dene-Daic language family, in common with South Mongoloids. In East Asia, then, there appear to be two subbranches sourced from the North, the Sino-Tibetan-speaking *Sinid* (colloquially called *Chinese*),[772] involving many European inputs from outside of Asia,[773] and the largely Tungusic-speaking Sibero-Tungid (often colloquially called *Siberian* or *Mongolian*). These are called together— if not *neo-Mongoloid*, then— *North Mongoloid*. They may also be identified by their tooth structure, which is, in contrast to the Sundadonts of South Asia, known as *Sinodonty*, and the North Mongoloids as *Sinodonts*.

[771] However, the early or proto-Turanids had, like the Alpinids, adapted a lighter skin tone, sometimes ruddy and other times quite fair, even having undertones of blue or yellow

[772] The Sinid appears to represent a North Mongoloid that has since adopted a South Mongoloid language, perhaps representing a distinct form of Middle Mongoloid

[773] Such as those of Scythian-related groups like the Yuezhi and influences from the Caucasus

The *Americanoid*, phenotype of the Native Americans, is quite complex, and as much if not more of an oversimplification than is "Caucasoid" or "Mongoloid." The Americas would see migrations from out of Northeast Asia. Sharon Day says the Americanoids who came from Siberia were put roughly into two groups by Neumann: the paleo-Amerindians and Ceno-Amerindians. The paleo-Amerindians represent an early migration into the Americas and the Ceno-Amerindians following them up later. Following Egon Freiherr von Eickstedt, *Centralids* are the people of Central America.[774] They are probably derived from Ovejerids and Otamids and people from later migrations. *Pueblids*, a form of Centralid, are of relation, probably somewhat ancestrally, to the Iswanids and Ashiwids of Neumann in North America. *Margids* refer to the populations of the deserts of Southwestern North America, and are a prominent substrate still in the Centralid subvariety called *Mayid*, prominent among the Maya, as well as among all of the desert peoples. The proto-Centralids, similar to Margids, probably gave rise to the *Iswanid* people associated with the Archaic Serpent Mount Builders and Kentucky Shell Heap, and an *Ashiwid* variety, associated with the Anasazi,or "Ancestral Puebloans" and derived basket-makers of the Southwestern Plateu such as the Zuni or Hopi.[775] Long considers the Iswanids possibly ancestral to the Sioux (Lakotids, Planids). Some scholars have denied a distinction between the Ashiwids and Iswanids. Texepan Walcolids, suggests Mario Pichardo, may be an exception to Otamids being the only skulls of the first migration. It may actually represent a Ovejerid or Walcolid presence among the Paleo-Amerindians. Pichardo wonders if the Texepan is somehow related to a desert culture that had somehow been pre-accustomed to farming, distinct from the Otamid hunters, giving rise to the Ashiwid. A later migration might bring the Walcolid people to the Pacific Coast and the Mississipi River Valley. The *Walcolid* group, found on the Pacific Coast and in central California as well as in the Mississippi Valley, practiced cranial deformation, and so Joseph K. Long has considered them a cultural group rather than one identified by phenotype. It may be that some of the Ovejerid partial inheritants of the Otamids tried to stay "in the family" by artificially shaping their heads like their patriarchs.[776] Another development would establish the Silvid. *Silvids*, according to Eickstedt, are Eastern North American Indians who started to populate the Great Plains later on. They may belong ancestrally to the Iswanid or Lenapid variety, perhaps representing a mixture of the two. They gave rise to groups such as Neumann's *Lakotids* or Eickstedt's *Planids*, the (Northern) Plains Indians, as well as Neumann's *Lenapids*[777] or Eickstedt's *Appalacids*, of

---

774 Neumann called them *Uinicids*

775 The Puebloan people often have a *sipapu*, or hole in the floor of their homes, to which they trace their origins, which are sometimes also associated with Snake City

776 Others, in Eurasia, such as the Yuezhi, Huns, Alans, Eastern Goths, and more are also known to have engaged in this practice, and, in South America, the Incans, Mayans, and others engaged in the practice. It is likely that this is owed to the Otamid heritage within these groups.

777 Long re-classifies the *Lenapid* of the Woodlands as an *Iroquoid*, which seems to me to be splitting hairs, as Neumann already classified the Algonquins from which the Iroquois were derived as *Lenapids*. Interestingly, there is an Algonquin people called the *Sauk* or *Sac*, but who call themselves the *Thakiwaki*, or "those who come

the North American Atlantic forests, which show traits similar to Cro-Magnoids or Lappoids, perhaps related to Solutrean foundations and being of relation also to the Yana of Siberia and the Sierra Nevadas. Neumann refers to Shoshone Indians, or "Snake Indians," of the Great Basin area, as *Nootchids*.[778] *Deneids* refers mostly to the people of inland Northwestern North America but alsp includes groups such as the Navajo. Navajo sometimes express an *Arizonid* type as well, a mixture of Silvid and Centralid, also common among Southern Plains Indians in general, such as among the Commanche and Apache. *Pacifids* probably have some relation to Polynesians and appear to have been Centralids who co-habited with the Na-Dene to a great degree, so much so that Lundman considered them to have been a Deneic subtype. The *Californid* is a particularly archaic *Homo sapiens* suggested to possibly be of some relation to the Ainu. It has prominent brow ridges, a receding and short forehead, a receding chin, and strong body hair for an Americanoid. *Inuid* refers to the Inuits and Aleuts of the arctic. These people were a much later migration, related to the Tungid-related Siberians who replaced the Lappoids during the Tungid expansion.

Polynesids, or at least some among them, particularly a *Nesiotid* variety explored later and probably elements among *Fijids*, the people of Fiji, and others as well, are likely derived from the Ovejerids, Margids, or Centralids, though others clearly come from out of Malaysia, Indonesia, Taiwan, Japan,[779] the Phillipines, and Micronesia, bringing some proto-Mongoloid and Mongoloid elements, likely making their way at times also, along with Australoid Melanesians, into the Americas. Eickstedt's *Brasilids*, or otherwise *Amazonids*, are the people of the Amazon, and also appear to be related to or derived from the Centralids. *Andids*, of the Andes of Peru and Equador in South America, appear to have more relation to the Silvids and Patagonids than to the Centralids, who seem to have cut them off from their relations up North. They are notably hypsicranic (tall-headed) but small-headed, with a hooked Roman nose, and connected to the Inca Empire. The mysterious Paracas Skulls of Peru, which have undergone artificial skull deformation (not unlike Prince Yuehzi in Eurasia), also have the "Inca Bone" at the back of the skull attributed to the Otamids.[780] *Patagonids*, of Patagonia, legendary home of the giants,are often quite large and sometimes hypsicranic. *Lagids*, of South America, are sometimes, along with Margids of California and old Mexico,[781] the Fuegids of Chile, and the Californid of Bertil Lundman in California, said to be a remnant of the paleo-Amerindians. Archaic features such as brow ridges also feature in the Fuegids, Lagids, and Margids, whose skin often tends also to be very red or copper-toned, giving rise to the stereotype of the red Indian. *Fuegids* include the strongly Otamid-related Yamana or Yaghan people of the Southernmost tip of Chile, where it is very cold.

The Americas are filled with mounds, earthworks, *puquois* (sophisticated wells), pit homes, shelters, houses, and pyramids. Some of the most interesting of these include the various serprent mounds associated with the Adena or Hopewell people, the Nazca lines, the pit homes of the Northern Californian Indians, the Cliffside pueblos of the Anasazi, the mounds of the Mississipian people, and the pyramids of the Olmecs, Inca, Maya, and Aztecs. There has been much speculation regarding the relationship between these structures and those found in the old world. For instance, the mud brick

---

from the water," perhaps being some connection to the Shoshone. Alternatively, they call themselves *Eshkwia* or *Meshwahkiha*, "people of the red dirt," not unlike the name *Adam* in *The Bible*.

[778] Georg K Neumann also says that the Shoshone represent the Margid phenotype most, and are mesocephalic. According to HumanPhenotypes, the Margid type includes the Mexicid, Californid, and Sonorid. The Californid is a particularly robust and archaic type of human, similar in respects to Neanderthals. This suggests an indigenous evolutionary origin for the Shoshone, perhaps separate from Otamids. The Otomi, namesake of Otamids, however, are classified as Margids on HumanPhenotypes.

[779] Such as Jomon, Ainu

[780] The Galley Hill Skull was also very long, similar to an Otamid in that respect

[781] California to Mexico

building of the Puebloans appear to have shared some similarities to the Neolithic and Chalcolithic structures in India, Mesopotamia, and Antolia, pyramids to those in Egypt and Southeast Asia, and mounds to the tumuli, and pit-homes to the pit-homes, of Eurasia.

Culture and Ethnicity

Archaeology developed from *antiquarianism*, less formalized considerations and musings over the distant past including over fossils, weapons, coins, myths, legends, folklore, and more. Jacques Boucher de Perthes, an early archaeologist, studied Stone Age humans, which he understood to be *Antediluvian*, or pre-Flood, and established the concept of the *Pleistocene*. William Harvey excavated *Stonehenge*, the giant stone structure in Britain. William Cunnington practiced excavations, digging trenches to seek out antiquarian novelties, producing artifacts from the Copper and Bronze Age burial mounds. Joseph Prestwich published on flint tools. John Evans studied coins and other artifacts of the Britons, Anglo-Saxons, and other peoples of Britain, while August Pitt Rivers collected weapons spanning from the Stone Age to medieval times, arranged so as to show their development, as influenced by the thinking of Spencer and Darwin. John Lubbock excavated Hallstatt with John Evans, and invented *Paleolithic* and *Neolithic* as terms. Christian Jurgensen Thomsen established the three-age system of Stone, Bronze, and Iron ages, to which Copper Age was later added by John Evans. Thomsen had noticed that there was a correlation between different kinds of artifacts with the sorts of metals in use at the time, such that the metals could be used as a sort of standard of measurement for the time period, perhaps a keen observation but one that might be expected of a coin collector of his sort. Edward Burnett Tylor maintained an interest in *survivals*, or relict customs and practices as well as in the evolution of religion from animism, suggesting that human progress was typified by cultural evolution from lower to higher stages.

It's important to understand that race and culture are not intrinsically interlinked, though they often are interlinked (and this is more true the further back in time we look). *Race* is the phenotypic grouping of people, while *culture* is the behavior, such as language, tool use, and other conveyable conduct. People from different races can and oftentimes do share a common culture, as with the Mousterian culture that was adopted by *Homo sapiens* from Neanderthal; or as with an ethnically French Congoid, a black whose phenotype comes from Africa, but who has become nativized as a Frenchman, speaking the French language and behaving as a Frenchman behaves. It is the sharing of common culture between races—perhaps starting with something like the Red Ochre Cult and carried into the Cult of the Cave Bear shared between Neanderthal and *Homo sapiens*— that brings them into contact long enough to seriously begin interbreeding. When this occurs, evolutionary progress tends to take place, as racial transcendence among humans often occurs through hybridization and is not limited to genetic drift or isolated mutations. Inbreeding, alternatively, breaks down the integrity of the species, leading to genetic defects, including sometimes monstrous deformities.[782]

Ethnicity,[783] or sub-race especially defined socioculturally and by way of group identity, may or may not be associated with differences in physical phenotypic traits. Ethnicity is not itself the same thing as the subrace to which it may be largely associated, but includes especially cultural variations, and most importantly self-identification, which set peoples apart, or distinguish them, from one another. Ethnicities, or nations, might be further broken down into tribes, clans, and bands or families.

[782] These can be carried on in royal families, even while they would otherwise be sexually deselected
[783] *Ethnicity* is an ancient concept going back at least as far as Anaximander

Ethnic groups have also been studied through archaeology and physical anthropology as well as antiquities such as myths. John Aubrey collected ethnographic folklore of Jews and Gentiles and helped to establish the field of *toponymy*, the recognition of place-names as it relates to ethno-linguistic origins. Johann Joachim Winckelmann studied art through archaeology, and distinguished between Greek, Greco-Roman, and Roman art, for instance. Jean-Francois Champollion, a philologist, deciphered the *Rosetta Stone*, an Ancient Egyptian stele or post, thereby learning how to derive meaning from hieroglyphics. He had been anticipated by Thomas Young, "the last man to know everything," whose work went unnoticed. William Flinders Petrie studied the Great Pyramid of Giza as well as locations in Britain, discovering the *proto-Sinaitic script*, an ancestral writing system to the Semitic and Greek alphabets perhaps derived from the Hyksos. Charles Piazzi Smyth studied the pyramids and concluded that the Hyksos had been the Hebrew people and that Israel was actually in England, pointing to an apparent "Egyptian inch" that was remarkably close in size to that of the English inch. Howard Carter would famously discover the tomb of King Tut, or Tutankhamun, perhaps the son of the monotheist pharaoh, Akhenaten, perhaps the teacher of Moses as suggested by Sigmund Freud. Heinrich Schliemann and Wilhelm Dorpfeld argued for the historicity of the Greek poets such as Homer using archaeological evidence, such as their investigation of Troy.

There is much debate among ethnologists regarding the nature of ethnicity. Some, as categorized by Thomas Hylland Eriksen, follow the view of *primordialism*, that ethnicity is innate, owing to unique cultural and ecological relationships as might be discussed in the field of environmental anthropology. Others, suggests Eriksen, adhere to an *instrumentalism*, the view that ethnicity is a "political" strategy used by ruling elites to establish influence.[784] There is likely some truth to both of these views, but whereas a primordial ethnology might be "porous" or open, an instrumentalist one would be largely closed off or, when open, arbitrary and non-ecological. Anthony Smith and others have described an alternative or complement to both primordialism and instrumentalism, *perennialism*, which sees ethnicity as being perennial, or recurring.

Valentyn Stetsyuk, in "Ethno-Producing Areas," proposes a geography-centered view of ethnogenesis, suggesting that it is the relationship between human customs and natural features, along with blood ties, that establishes ethnicity. He suggests, for instance, that, in various ecological-geographical (and largely hydrological) niches of the Dnieper River area of Eastern Europe that the "Indo-European uprising" had been gestated, including the appearance of early Celtic, Germanic, Thracian, Italic, and other speakers of *Indo-European languages*, those that predominate across Europe. He suggests that this was followed by later waves of Indo-Europeans, including one more specifically Germanic and Iranic, and another more Slavic, seemingly still in process. This makes the area an emanation point, Stetsyuk suggests, for many of the dominant cultures of Eurasia. The Don and Volga areas were also, says Stetsyuk, "ethno-producing areas." This seems very reasonable as an ecological source of ethnic or semi-racial and cultural differences. He says,

> In the period of the transition of man to a productive economy, the role of these boundaries becomes more and more important. This became especially noticeable when human communities with different types of management were neighbors and representatives of productive and unproductive economies came into contact. And the more the importance of organizing the territory grew in cases where different communities used the same ecological niche.[785]

[784] Max Weber and others hold that ethnicity is an entirely artificial, social construct. This seems a bit unhinged from Nature
[785] Stetsyuk[1]

Here Stetsyuk is touching on political or semi-ideological differences as a source of ethnicity, an example of sympatry. And this seems, to me, from my own research, to have something also to do with the apparent "blood ties" of ethnicity, which seem to owe to more than proximity, almost certainly having to do with the efforts of narcissists or their emulators, and surely with social stratification. Stetsyuk seems to imply social stratification is largely lacking, but blood ties seem to imply patriarchal relations to tribal rulers. It must be remembered that this area had also long been home to animal husbandry practices, including selective breeding efforts. The degree to which this can be factored into ethnogenesis is not known, but some degree of it is potentially at play.

Ethnicity is as much about a common genesis of culture as it is about race, and is particularly associated with the language of a given group and oftentimes a founding myth celebrating a founding patriarch (or, in matrilineal societies, matriarch), whom at least some of the members can trace their lineage back to, tying them together despite otherwise disparate origins; those who are not related to the founder nonetheless value the founder and see the founder as valid and legitimate, if they cannot be tricked into believing that they are of relation. Many ethnic groups are of a largely mixed subrace, which itself may be a hybridization between the five macroraces, as when Mediterranoids and Caucasoids and Mongoloids mix in the Turkic zone of the Eurasian Steppes or Yakutsk, or when Mediterranoids, Caucasoids, and Congoids mix in the Berber region of North Africa. Ethnic groups within these subraces, however— often composing subraces unto themselves—, will nonetheless tend to share cultural affinities especially by way of language, and often can be identified to a great extent by genetic markers, found in relatively high frequency, as passed on by founders. Sometimes founder events are associated with *bottleneck* events, wherein only a very small number of individuals are understood to have contributed to the genetic profile of a given people at its founding. This is called the *founder effect*.

The intermixing of various Mediterranoids and Caucasoids produces subraces of these subraces— such as Atlantids and Dinarids—, and so on.[786] But even within and between these subraces, language groups and cultural identity distinguish certain ethnic groups from others. Thus, Mediterranoids are found prominently in North Africa, Southern Europe, and West Asia, but some of them are Indo-European, some Semitic, some are Spanish or Italian, some are Berber or Arab. They share a race, but belong to different macro- and micro-ethnicitie according to their languages and histories. Language groups, then, largely distinguish ethnic groups within or between races. Mediterranoids and Caucasoids may speak Caucasian languages or Indo-European, Semitic, or Indo-Aryan languages, for instance, while Indo-European may further be broken down into language families such as Celtic, Germanic, Italic, and so on. That ethnic groups might distinguish a group across racial boundaries—for instance, the English include Mediterranoid and Nordid with some Cro-Magnoid[787] stock—suggests that ethnicities are also a form of speciation that begins to generate a new race by way of hybridization. This *Atlantid* race, for instance, is fairly continguous with the British people, and represents the emergence of a new subrace from out of the combination of the peoples of Britain, a slightly re-darkened Nordid type similar in some respects to the continental Dinarid, another hybrid.[788]

As with human races, which are more groupings than examples of genetic relation, language groups are largely the products of hybridization over time, with divergence playing a secondary function. Rudolf Rocker says, in *Nationalism and Culture*, that

[786] Until the unique individual can be described, a microrace unto themselves, within a family of individuals often from the same race

[787] Such as Brunn, "paleo-Atlantid," and Borreby

[788] For the sake of this general work, including the various mixtures of Alpinid, Mediterranoid, and Nordid, such as Gorids, Carpathids, etc.

> Among the present existing languages there is not one which has developed from a definite people. It is very probable that there were once homogeneous languages, but that time is long past, lost in the greyest antiquity of history. The individuality of language disappears the moment reciprocal relations arise between different hordes, tribes and peoples. The more numerous and various these relations become in the course of the millenniums, the larger borrowings does every language make from other languages, every culture from other cultures.

He says,

> For the development of every language the acceptance of foreign elements is essential. No people lives for itself. Every enduring intercourse with other peoples results in the borrowing of words from their language; this is quite indispensable to reciprocal cultural fecundation. The countless points of contact which culture daily creates between people leave their traces in language. New objects, ideas, concepts — religious, political, and generally social — lead to new expressions and word formations. In this, the older and more highly developed cultures naturally have a strong influence on less developed folk-groups and furnish these with new ideas which find their expression in language.[789]

Most of the world's languages, outside of sub-Saharan Africa and Oceania, can be fit into a category that has been called the *Borean languages*, proposed first by Harold C. Fleming though now in competitiond with Sergei Starostin and others. While the details are still being worked out,[790] these may include two major divisions, the Nostratic and Dene-Daic, which I will go ahead and use for pragmatic purposes, though my understanding will diverge a bit. Borean languages include all of the the major language groups, among them the Indo-European (some say *Japhetic*) and Turanian or Ural-Altaic, together in the *Eurasiastic* language category; the Semitic, in the *Afroasiatic* category; and Sino-Tibetan in the *Dene-Daic*, along with the North Caucasian and Austric languages. Many other languages exist, but these are the most prominent and relevant for our discussion.[791]

The *Nostratic languages*, a category first refined by Holger Pederson from older foundations, but followed up by Vladislav Illich-Svitych, and Aharon Dolgopolsky, among others, contain the *Eurasiatic*, among them arguably the Turanian (Ural-Altaic) and Indo-European languages, as well as the Kartvellian; and the *Afroasiatic*, including especially Semitic languages. The *Turanian* languages are spoken by people generally found in Central Asia and surrounding areas, and include peoples of Scandinavia such as the Finns and the Sami (whose language is probably more proto-Turanian than Turanian-proper), and the various Uralic and Altaic peoples across especially Central and Northern Asia, including the Turks and as far as the Mongols and Manchu. These peoples often, but not always, share a basic Turanid phenotype, marked by round heads and sometimes almond-shaped eyes, sometimes having epicanthic folds or hoods, and often stout bodies, with people such as the Mongols and Manchu being considered to have racially diverged to a Mongoloid phenotype that also shares these characteristics, often having strongly slanted or almond shaped eyes. *Indo-European* includes the vast majority of the peoples of Eurasia from Europe to India, and in the Americas and Australia, and include people such as the Germanic and Celtic peoples, the Spanish and Roman peoples, and the Greek and

---

[789] Rocker[1]

[790] The evolutionary interpretation of language among the mainstream is still likely based on divergent, rather than convergent, concepts of evolution. That is, on entropy instead of syntropy. This will necessarily lead to problems with categorization and a tendency to look for familial relationships where there are none.

[791] I am not sticking to any particular established model to any detail. These groupings have been established by various people, all with good reason, and I am using the groupings according to my own understanding, and not according to a particular model, method, or discipline.

Slavic peoples in Europe and Asia (Russia), and a wide number of peoples outside of it, ranging throughout Eurasia, from the Iranic Kurds to the Drokpa in Tibet to the Jats in India. *Kartvellian languages* are spoken in the Southern Caucasus, especially among Georgians, having a Caucasoid phenotype, and likely split from the other Eurasiatic languages very early on, sometimes placed outside of Eurasiatic altogether into its own grouping in the Borean languages. The *Semitic* languages include peoples of North Africa, the Levant, Arabia, and surrounding areas, especially, including Arabic, Aramaic, and Hebrew among them. Indo-Europeans and Semites are typically and natively of a Mediterranoid or Nordid phenotype, but these languages have been widely adopted by people of other types as well, especially by Alpinids and Turanids, themselves closely related to these others.

The *Dene-Daic* languages, defined first by Sergei Starostin (as a widening of a previously-existing group), contain among them the Sino-Tibetan, North Caucasian, and Austric languages, as well as the Na-Dene, among many others. This family combines groupings especially of the Dene-Caucasian of Alfredo Trombetti, Edward Sapir, Robert Bleichsteiner, and others, and the Austric of William Schmidt. *Sino-Tibetan languages*, a Dene-Caucasian language group, give us languages of Eastern Asia, among them the Chinese and Tibetan languages, typically associated with a Mongoloid phenotype, and in particular a Northern Mongoloid, cold-adapted phenotype, sometimes considered a later variant. *North Caucasian languages* split into Northeast, or Caspian, and Northwest Caucasian, or Circassic, languages. Sometimes Sino-Tibetan and Northern Caucasian languages are placed together into a category called *Sino-Caucasian*. The *Dene* part of Dene-Caucasian refers to the existence of the Na-Dene languages of Native American peoples such as the Tlingit and Navajo, which may have made its way into the mix after an expedition from Out of America and into the Yinisei River, Ural, and Caucuses areas, if not the other way around as is commonly held and almost certainly also occurred, sometime before the Eskimo-Aleut or Thule displacement of the Dorset peoples.[792] The *Austric* languages include the languages of Southeast Asia and much of Oceania, perhaps especially the *Austronesian*, a language spoken widely by maritime peoples such as Taiwanese, Malaysians, and Polynesians, having either a "pseudo-Mediterranoid" or Malaysian phenotype,[793] and *Austroasiatic*, perhaps being the first language family of mainland Southeast Asia, spoken by peoples such as the Khmer, Mon, and Vietnamese, having a South Mongoloid phenotype, sometimes considered to be close to paleo-Mongoloid. The proto-Malaysian phenotype, too, involves input from South Mongoloid.

---

[792] Regarding the American Indian languages, Vitaly Shevoroshkin argued in favor of an Algic and Na-Dene connection, while Joseph Greenberg and Merritt Ruhlen argued that all of the languages that did not fit into Na-Dene and Eskimo-Aleut language branches belonged into a family called *Amerind*. It seems likely, to me, that the Amerind grouping is a synthesis of paleo-Amerindian-founded languages including—especially in "South Amerind"— influences from Africa and Oceania, if not also Asia, and that it contains remnants of the ancestral languages to the Na-Dene and the North-Central Amerind languages, which includes the Algic. In fact, North-Central Amerind includes the Algic-Keresiouan languages that unite the Algic or Algonquin languages of the Ojibwa with the Iroquois, Sioux, and Caddo; the Penutian-Hokan languages of the Western Coastal Indians including the Shasta and Yana people, as well as the Zuni people; Gulf Indians such as the Natchez; and the Mayans and Aztecs. Southern Amerind contains less commonly-recognizable examples, owing more to Melanesian influence, perhaps. It is probable that there was a fair exchange of genetics and culture between Americanoids and especially North Mongoloids by way of the Bering Strait such that Na-Dene represents more of a continuum than a strict unilateral migration pattern, something like the Turkic cline perhaps. Aleut-Eskimo languages would see a later wave of possibly Samoyedic-derived peoples related to the Yupik people of Yakutsk enter into the arctic range of North America, the Aleut-Eskimo languages being considered a relative of the Uralic languages.

[793] This might mark some divergence between "pseudo-Mediterranoid" and Malays, perhaps suggesting a place of speciation between Mediterranoids and South Mongoloids in Southeast Asia, a split that may also have occurred later on in another area, perhaps the Caucasus, contributing to Caucasoid and North Mongoloid phenotypes.

Both Nostratic and Dene-Daic have some claim to *Elamo-Dravidian* (and other languages). That Elamo-Dravidian is claimed by both families in the cleavage suggests that it or an ancestor might have existed at a time when the cleavage was being established.[794]

The Dene-Caucasian languages are not alone in proclaiming a transcontinental connection across the oceans. Otto von Sadovszky, in "The Discovery of California: Breaking the Silence of the Siberia to America Migrators," suggested that 80% of Californian Indian languages, such as the Penutian (like Yokutsian), were related to the Ugric languages, an idea known as the Cal-Ugrian Theory. He suggests that the Penutians were basically Hungarian, and entertained notions of possible back-migration.

> If we were to state that the ancient populace of California were Hungarian, this would cause immediate concern among those historians who, under the scientific aegis of the Hungarian Academy of Science, boldly state that they are the experts, and we would be declared to be chauvinistic Hungarians, chasing rainbows. In this way, they would continue to denigrate the research of ancient Hungarian origins in order to preserve the superiority of the Finno-Ugric theory. Historians from the Successor States follow this example so that they may continue to retain the territories which they received at the Treaty of Trianon and which, according to International Law, they occupy illegally, although this is not widely recognized. Yet they should know that historical truth cannot be suppressed forever. We have come to an era in which those secrets, which have been kept locked away, are finally coming to light.[795]

As with the Dene-Caucasian languages, this author suggests that the transfer may have been a two-way street, with Ancient Californians, perhaps Otamids or Californids, exchanging resources and culture with the Finno-Ugric peoples.

And, of course, these are certainly not all of the languages that exist in the world. They are, however, the main languages of the world, and especially those of the Northern Hemisphere that relate to European society and the heretics and radicals there, who are the ultimate focus of this book. There are nonetheless languages outside of the Borean family, to be found especially among Congoid and Capoid peoples of Africa, Australoids of Oceania, and dispersed among the peoples of the Americas, all representing populations that had existed prior to the Borean expansion. And, of course, I have not even touched on all of the languages in the Borean family, some of them falling even outside of the Nostratic and Dene-Daic languages perhaps.

The *Borean convergence*, the time in which the major languages of the Northern hemisphere had converged from out of local *pidgins*—informal, impromtu languages—, is likely not to have come from a single location, as might be expected and as theorized, but rather from a single *milieu*, itself having many locations. This *milieu* was not established familially or geneologically, or even formally, but convergently and teleologically, as metaphysical structures of language, as well as physical utterances, only allow for so much variation and combination. For instance, some languages are analytic or isolating, and still more synthetic or inflective, fusional, or agglutinative. That leaves just a few major possibilities for any new language to take form within, meaning that each language essentially chooses a *milieu*, a category within which it falls with like others, non-familially. This is similar to a person

---

[794] By Biblical standards, Elamo-Dravidian may be a Semitic language, as Elam was a son of Shem and Dravidian is sourced, at least in part, from Elamic languages. However, some hold that Dravidian is actually more closely related to Caucasian languages than to Afro-Asiatic or Elamic languages, in which case Dravidian would be Japhetic. Like most things related to human culture, Dravidian is most likely a hybridized language. But whether it is ancestral or descendent to Indo-European (Japhetic) or Semitic is, for the author, undecided.

[795] Sadovszky

choosing their place of employment, which often has nothing to do with a genetic relationship to the people working there. Nonetheless, the people working there are part of the same company culture, they use the same tools, and use the same terminology. Not because they are related, but because they all had to choose among a limited number of options, leaving some to choose the same option. As such, convergence and synthesis of languages is inevitable, as languages evolving in separate locations will face the same vocal and categorical constraints upon their development. Those languages that fall into similar categories, similar metaphysical structures, in their development, will tend to find more compatibility and mutual intelligibility between their words and syntaxes, with a common language developing from out of their resonance. If this resonance takes place in multiple areas, these points may meet. Languages *synthesize* when they begin to become mutually intelligible to one another, but *diverge* when they lose that mutual intelligibility, both occurring to degrees, but with synthesis being the general rule. Speaking of the social and synthetic nature of language, Rocker says that

> speech is not a special organism obeying its own laws, as was formerly believed; it is the form of expression of human individuals socially united. It changes with the spiritual and social conditions of life and is in the highest degree dependent on them. In speech, human thought expresses itself, but this is no purely personal affair, as is often assumed, but an inner process continually animated and influenced by the social environment. In man's thoughts are mirrored not only his natural environment, but all relations which he has with his fellows. The closer the union to which we belong, the richer and more varied the cultural relations we maintain with our fellow men, the stronger are the reciprocal effects which unite us with our social environment and continually influence our thought.
>
> Thinking is, therefore, by no means a process which finds its explanation solely in the mental life of the individual; it is likewise a reflection of the natural and social environment which crystallizes in man's brain into definite concepts. From this point of view the social character of human thought is undeniable; and as speech is but the living expression of our thought, its existence is rooted in the life of society and conditioned by it.[796]

In *The Bible* there are at least two major mentions for the source of languages. Among these are the sons of Noah, Shem, Ham, and Japheth, and the event at the Tower of Babel, wherein the languages of humanity are said to have been scrambled as a result of the attempt to construct a tower to heaven.[797]

Shem is said to have given rise to the Semitic languages, such as Hebrew and Arabic; Ham is understood to give rise to various different languages, perhaps most importantly those of the Elamo-Dravidian sort, or otherwise, as some claim, the Bantu; and Japheth is undertood to have given rise variously to the Caucasian, Ural-Altaic, and Indo-European languages. However, this is contested among the religious, with some claiming that Indo-European is the true Semitic or that Turanian languages are Hamitic. Whatever truth there is to this arrangement of the languages, if there is any, it was at one time the standard, and even to this day is considered by many, especially religious but even

---

[796] Rocker[1]

[797] The Tower of Babel, associated with Chaldea and Ancient Babylon, had involved the construction of a giant tower that was said to be an attempt to reach the heavens, for which God was said to have scrambled the languages of men, making them unable to speak to one another in a common tongue, and thereby sending them on their separate ways as separate tribal or ethnic groups. In the past, this event had been taken quite seriously by scholars of anthropology and linguistics. Ancient Hurran, which has been associated with the Moon god Sin, has been cited as a potential site for the Tower of Babel, and had maintained paganism for quite a long time. The Hurrians, perhaps a continuation of the Natufians or Basal Europeans of Gobekli Tepe, were star-worshippers, their astrotheological beliefs likely continuing on into the present day in the form of the Sabians (or Sabaeans) and having been a major influence on the later Babylonians.

those not, to be a valid, if not sound, taxonomical arrangement. *Semitic*, especially, is a label that still sticks with us, having come from *Shemitic*.

There are numerous possible locations for what may have been a Tower of Babel in the Middle East, the most likely perhaps being Chaldea or Hurran, among star-worshippers who may have passed their religion on to the Sabaeans or Sabians. Alternatively, the Entemenaki Ziggurat may be the Tower of Babel, in Babylon. And, indeed, Rudolf Rocker makes a strong case that while culture is something that develops organically, the development of nations is done by the state. He says, "[t]he nation is not the cause, but the result, of the state," believing nations and governments to be basically like religion. Rocker says, "[o]ne is a German, a Frenchman, an Italian, just as one is a Catholic, a Protestant, or a Jew."

Rocker had held that there is a difference between physical science and the humanities, believing the former to be deterministic, but the latter to be subject to the German philosopher Nietzsche's concept of the *will to power*. These represented two different sorts of causality, one having to do with physics, and the other having to do with will. Rocker supported the will to power of the working class, and of culture, over that of the nation.

If we consider what Rocker has to say about nationalism and culture, in relation to the story of the Tower of Babel, we might find that this Biblical story tells a narrative that might not be entirely incorrect in describing a centralistic source for the division of the world's languages, however close to the details it may or may not be. Indeed, there are linguists who believe that, at one time, there was something of a *proto-world* or *proto-human* (*proto-sapiens*) *language*, a pidgin[798] that preceded the division of the world's languages. This language, or perhaps language *milieu*, a pidgin and its derivatives, may have been widely uttered or participated in before the rise of statecraft during the advanced horticultural and Copper Age era.

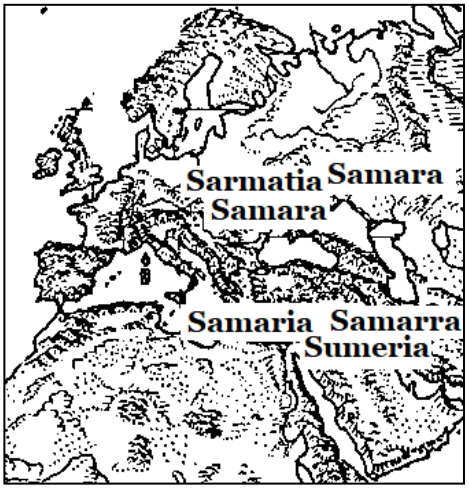
The complexity of race, ethnicity, and culture entails that human groupings are not always clear-cut. That different races may share an ethnicity, and that different ethnicities may share a material culture or religion, means that the combined study of physical anthropology, archaeology, myths, and languages will typically produce inconclusive results regarding strict lines between people groups, and reminds us that the arrangement of individuals into groupings is a highly-contingent, even if well-established, *heuristic*, or "rule of thumb," a working hypothesis. While there may be a great deal of overlap, in many cases, between physical anthropology and material and oral or linguistic culture of given groups, rarely is this completely unadulterated by miscegenation and integration.

Hyperboreans, Aryans, and Turanids

However important the earlier Natufians may have been to the development of settled life, and however far this way of life was spread by Caucasoids and Mongoloids, humans had not yet established a system of *agriculture*, which depended on the use of the plow, especially as drawn by animal labor. This would be established through people such as the *Painted Pottery People*, perhaps the first to start painting their pottery. *Kura-Araxes*, a Neolithic Garden Culture, from which the Painted Pottery People are largely derived, were a Transcaucasian culture that developed as a synthesis of different traditions around Mount Ararat, as shown by the vast array of burial practices that they had among them, from flat graves to kurgans or burial mounds to stone crypts. They were possibly derived from earlier people such as the Zarzians, and societies of Catalhoyuk in Anatolia or Tell Sabi Abyad in Syria, potentially the

[798] *Pidgin* is a makeshift language, which is constructed largely as dealings with another person are undergone. Each party will make use of each other's words as a sort of precedent in their mutual dealings.

first to use painted pottery as well as woven baskets, and themselves potentially influenced by Yenisein immigrants from societies such as Afontova Gora. The Painted Pottery People had notably started to use cuneiform writing and clay tokens to mediate exchanges, and are considered the home of kurgan burials and the Indo-European languages.



The *Samara* culture, with a single *R*, was a Painted Pottery culture of Eastern Europe, surrounding Volga and Dnieper rivers area, that had likely developed, in part, from out of Zarzian foundations that had become admixed with other peoples, particularly those of the Steppe, perhaps including incoming Americanoids. It is considered one of the earliest producers of pottery. The *Samarra* culture, with two *R*s, a relative of the Samara culture of Eastern Europe, and especially strong in the Zarzian influence, was based in Mesopotamia, where they practiced irrigation for their crops and made fine, painted pottery, perhaps the first to really do so, at least with an export quality.

The *Yamnaya*, or *Yamna*, their name perhaps related to the Yana, were likely a primarily Mediterranoid people who had had some admixture with the Caucasoids of the Caucasus and also the Lappoids or Turanids of the Ural or even Altai mountain ranges. Like the Yana in California, the Yamnaya were known to have (along with kurgans) also buried their dead and inhabited homes in pits. They were also tall, long-limbed, robust, and practiced headbinding or artificial cranial elongation. At least some of the input into the Yamnaya had come from the Afontova Gora people of the Yenisei River area, Ancient North Eurasians who would join with Eastern and Caucasus Hunter-Gatherers in Eastern Europe to establish the Samara culture,[799] the Kurgan people from which the Yamnaya largely developed. In this respect, the Yamnaya represent also, along with the Samara, early or proto-Samaritans or Sarmatians.

Later burials of the Painted Pottery People show a dominance by *kurgans*, or burial mounds, suggesting the establishment of a hierarchy by the kurgan practitioners ("proto-Indo-Europeans," possibly Uralic or Altaic peoples). The Yamnaya, if not the Samara or a related people, would become responsible for the spread of the kurgan burials (also called *tumuli*, burial mounds) and the Indo-European macroculture, as well as fair skin, and may be considered to be proto-Nordid,[800] Aryan peoples.[801] It was not too long after the establishment of dominance by the Indo-Europeans or Kurgan people from the Kura-Araxes and Samara, that the Yamnaya took the lead on an even wider Kurgan Expansion. This

[799] Interestingly enough, some Yenisei Samoyeds, or Yugh, are called *Yana*, which is similar to *Yamna*, another way to say "Yamnaya"

[800] *Nordid* is used to refer not just to ruddy- or pale-skinned Caucasoids and Mediterranoids, but especially those that have red or especially blonde hair and green or especially blue eyes. The red-haired and green-eyed variant, sometimes not considered true Nordid or an earlier version, is found among the Celtic peoples, whereas the blonde-haired and blue-eyed "true Nordid" is represented most strongly among the Germanic people. However, these features, to varying extents, might also be found among some Slavic, Turanid, and Irano-Afghanid peoples. The Phoenicians were also said to have red-haired individuals among them. *The Bible* mentions red hair in relation to Esau, suggesting that red hair might have been common among Hebrews and other Canaanites.

[801] Caucasoids, such as Otzi— himself having had light skin—, have, like the Yamnayan-derived people, also been referred to as *Aryans*, a term that has come generally to mean "white people," but which derives especially from the relationship of these people to other peoples in Iran, Pakistan, and India, whom they had conquered, forming a racial and cultural superstrate over them, also associated with Vedic religion, from which Zoroastrianism and Hinduism are derived. *Iranian* is derivative of *Aryan*.

Kurgan Expansion is called such because it traces the spread the tumuli, which became the signature of Indo-European spreading, according to thinkers such as Marija Gimbutas and her followers.

Light skin, which has been traced to various sources—from Neanderthals to Cro-Magnoids, Mediterranoids, and even Americanoids— as an albinized, polygenetic trait, would spread especially after the advance of the Yamnaya. Having light skin may have served a role during survival of harsh cold periods. An author, writing anonymously, in "Fourth strand of European ancestry originated with hunter-gatherers isolated by the Ice Age," writes that

> Populations of hunter-gatherers weathered the Ice Age in apparent isolation in the Caucasus mountain region for millennia, later mixing with other ancestral populations, from which emerged the Yamnaya culture that would bring this Caucasus Hunter-Gatherer lineage to Western Europe.[802]

The Samarra culture, in Mesopotamia, would develop into the Ubaid period, in which chieftains increased in their power and with it stratification rose, decreasing the otherwise egalitarian culture that had othwerwise relied on fraternal arrangements. It was here that the first true states in the West would be established, among them Uruk, bringing about the Uruk period and the origins of the Sumerian civilization. *Civilization*, complete with sedentary life and agriculture—which required animal husbandry and fertile land stewardship—, owes itself to the mixture of horticulture and pastoralism, the conquering of Alpine and Turanid horticulturalists by Indo-European, Turanian, and Semitic pastoralists. Carroll Quigley says that

> The earliest civilizations were derived from a number of closely related producing societies [called] the Neolithic Garden Cultures, or, less accurately, the Painted Pottery Peoples. The latter were the first peoples to have agriculture, and thus formed the earliest producing societies in history.[803]

There were other Kurgan and Painted Pottery cultures, as well. South of the Yamnaya lived the Maykop culture, an important Kurgan culture to the Bronze Age Caucasus, neighboring also the Kura-Araxes, to the South. The Maykop and Kura-Araxes were sedentary rather than nomadic, similar to the Samarra, and contained an Alpine substrate (perhaps Natufian-sourced) and Steppe superstrate. Pastoral conquerors conquered horticulturalists and forced them to pay tribute and into *corvée* labor, mixing their understanding of horticulture with the pastoralists' rearing of animals, giving way to the plow and, thereby, agriculture proper. These Alpine people would compose the principal population of the European peasantry and artisans, and it was among the Alpine or Turanian people that textiles became established as an important industry, not to mention metallurgy.[804]

The synthesis of pastoral and mountain sentiments would, in the long term, produce a mythology of Sky Father— masculine embodiment of both the Sun and the Moon— and Earth Mother—the feminine Earth—, with rain understood to be the semen of the Sky Father and the fertile fields understood to be the Earth Mother's womb, producing the children of the Earth, plant, animal, and human. The Kurgan Expansion would come with spiritual-religious ramifications, that is.

---

[802] N/A[3]

[803] Quigley, 79

[804] The textiles industry would contain a thread of radicalism in it for a very long time. The Eastern practice of *tantra*, the esoteric tradition within Hinduism and Buddhism, means "to weave," sometimes understood to mean that it is a method by which one comes to weave their own life's way, being understood as a path of liberation. It would be within the textile industry that the later philosophy of Mutualism would be developed, millennia later.

Humans would not be sagacious apes if we were incapable of comprehending the truth of monism, subjectively oriented as pantheism. However, there had been a breakdown in what may have amounted to the pantheistic view long ago around the time of the Younger Dryas, which fractured this understanding—perhaps even our minds[805]— to some extent and gave rise to more gendered expressions of deity, first feminine and then masculine, which themselves deviated from the original balance of gender— won in decreased sexual dimorphism—, expressed as monogamy and acephaly.

According to Carroll Quigley, there had been something of a religious divide that occurred between the Northern pastoralists, those of the South, and the highland people of the mountains and along the mountain valleys and edges. The early "highland" people of the mountain edges— who were among the first to develop horticulture outside of the Levant, often referred to as the *Neolithic Garden Cultures*, and typically Alpinids— had taken to the worship of Mother Earth, perhaps following after the lead of Neanderthal, Capoid, and Cro-Magnoid, and other older belief-systems that had been pushed into the highland zones when displaced by the climate with those who could take better advantage of its changes. As it turns out, the Late Stone Age and the Copper Age had seen the rise in worship of feminine deities, such as the Earth Mother, especially among Alpine and other mountain peoples. But the peoples to the North and South of the mountain ranges were patriarchal, and worshipped masculine divinities. Quigley holds that after the Alpine peoples had taken to the valleys near the mountain edges they had been conquered by the pastoralists, who had established themselves as the ruling class over them. He says,

> One of the great events of the historic period has been the linguistic submergence of these [roundheaded] Alpine agglutinatives by the longheaded inflective speakers, especially by Indo-Europeans, as a consequence of population movements engendered by two acute dry spells of the historic period.[806]

It appears that this would also mark a shift wherein new mountain people appeared, perhaps a revival of an even older mountain people, conquering the original albinos or Alpinids. These new mountain people would be known variously as *Gutes*, *Gods*, *Goths*, *Juts*, *Jats*, among other things, likely originally referring to their status *as* mountain people, especially as found around water sources. Some of these individuals would claim divine statuses granted to them by Nature, or even to be masculine embodiments of Nature herself, leading *God* to refer both to Divinity as well as to a human being with governing capacities. Offerings would be left for the gods, perhaps similar to a silent exchange but evolving into the tributary system, and the gods would begin to claim titles as chieftains, such as with the *Godi* or *Gothi*— literally meaning "God"— of later Germanic tribes.

Among the Painted Pottery People were the Gutians. *Gutians* were albinized barbarians from the Zagros Mountains, foothills on the Iranian plateau, who were rich in tin[807] and who took over the Akkadians (the first empire in Mesopotamia, who conquered the Sumerians and spoke an Afroasiatic language, in common with the Horn of and North Africa, Egypt, and Canaan) and the Hatti, much as the Germanic tribes who conquered Rome[808] would do later on in the Iron Age. As Samir Abbas tells it, in "Kurds and Gutians,"

---

[805] As discussed later on

[806] Quigley, 192

[807] The Zagros mountains, South of the Caucasus, had been an important source for tin needed to turn copper into bronze. Amorites were similarly barbarians who adopted the culture of the conquered and became known as civilized leaders.

[808] Alexander Conze considered the Doric Greeks to have been a Germanic people as well, based on geometric pottery; while *Doric* is also a Germanic Scot dialect

> the Gutians appear to have been initially hailed by the Sumerians as deliverers from the Semitic Akkadian oppressors. The reason given for the Gutian attack on the Akkadians by the Sumerians is the destruction of the main Sumerian religious shrines by the fanatical Akkadian ruler Naram-Sin [...] The destruction of Akkad or Agade by the Gutians was thus viewed through Sumerian eyes as rightful vengeance against those who destroyed the Gods' shrines and temples, and those taking this revenge as rightful liberators of the oppressed Sumerians.[809]

The Gutians adopted the cultures of those they conquered, becoming the Hittites in Anatolia, for instance.

With the inclusion of tin into their copper, the Painted Pottery People had moved the West into the *Bronze Age* proper. Buckminster Fuller held that the Bronze Age was not something that had actually occurred in Eurasia, but that it had instead occurred in Southeast Asia. He points to the fact that the Phoenicians had to sail to Great Britain in order to mine for tin, to be combined with copper to form bronze; whereas in Southeast Asia, particularly in Ban Chiang, Thailand, "tin and copper co-occur abundantly." This would allow in Ban Chiang what was missing in Canaan (home of the Phoenicians), in particular, a timeframe allowing them to become "subject to accidental melting together."[810] The Gutians of the Zagros may have been the first among the Westerners to understand the use of tin, and happened to be naturally rich in it. With their knowledge, they would conquer city-states of Mesopotamia.

Gimbutas suggests that the Kurgan Expansion had led to patriarchy—properly defined as "rule by father"— and a society based on dominance, whereas Old Europe, before the arrival of the Kurgans, had been a society based on the worship of Mother Earth and was based on partnership. The herding people of the lowlands, North and South, were thorough-going male chauvinists, violently forcing others into the refuge zones. The Bronze Age had seen, with the Kurgan Expansion, the proliferation of patriarchal Sky Father gods— oftentimes personified as a storm god like El, Zeuss, or Thor, or, as carried over into the Amerindians, the Thunderbird—, phallus worship, a pronounced return culturally to polygamy and harems, and denegration of Mother Earth, coming from Mediterranoid and Turanid peoples. The religion responsible was likely pantheistic but also shamanic, and similar in many respects to Yazdanism as well as to the neo-pagan reconstruction of native Slavic beliefs, called *Rodnovery*, perhaps also the Bear Cult, as Slavs were known to have worshipped bears. The Earth religion it was overcoming was likewise pantheistic in a sense as well, but that had worshipped the feminine. Both had animistic elements. The central conflict between the Northern and Southern pastoralists, says Quigley, was not whether the deity was masculine or feminine, but whether the masculine deity was the Sun or the Moon. The feminine deity of the highlanders was the Earth.

There are conflicting stories regarding the origins of these Aryans, or Indo-Europeans, however. This perhaps suggests multiple sources of input.

John Yarker relays to us the "secret doctrine," that an apparent Adamic race, which was distinguished by a division of gender signified by the formation of woman from Adam's rib in *The Bible*, had

> after developing a monosyllabic language, now represented by Chinese, to have long spread over the long lost Pacific continent; here they became great builders, developed the religious Mysteries, and spread from North to South, populating the Atlantic continent [...] after the Pacific continent had disappeared. Here was the

[809] Abbas
[810] Fuller, 16

> home of the proto-Aryan race of a brown-white complexion. A colony of these settled in Egypt in remote ages [...] Another colony of priests settled on an island, where the desert of Gobi now exists, but then an inland lake, which held in its bosom 12 smaller islands. These priests, or at least some of them, allied themselves with a red-yellow Mongoloid race possessing great intuitive powers, a race of which the Chinese are a branch [...]
>
> The intermarriage of these two races, which we may compare with that of the sons of God with the daughters of men, gave rise to a fifth race of Aryans, who sent out civilizing missions over the world, and it is asserted that there are records which show that these priests travelled into Europe to superintend the erection of religious structures such as existed amongst the British Druids, and it is not impossible, as Eastern civilization had a lengtht precedence over that of Europe.[811]

It seems that what Yarker is describing here is the mixture of a Polynesian-sourced Mediterranoid, possibly a Nesiotid, with that of the common ancestor of both the Lappoids and the North Mongoloids, or perhaps even with Denisovan or Capoid more directly, though these were likely also influenced on the Lappoids. This intermixing gave way to the Aryan race, suggests Yarker, which is today associated especially with the Kurgans in general or the Yamnaya especially. Around the same time that the Painted Pottery People of the Caucasus saw hierarchy established by the kurgan practitioners, and the formation of states, the *Yangshao Culture*, another pottery-painting culture found at the start of the Silk Road, was similarly establishing states and shifting toward patriarchal social structures and adopting the worship of a sky deity. It may be that the Kurgan Expansion represents the landed expansion of Big Men, Kapauku, or chiefly systems.

Various other Bronze Age peoples could be found throughout Europe (and across the world).[812] Among the languages spoken in the area was Hurro-Uratian, and the anticipants of Indo-European, Semitic, Kartvelian, and Northeast Caucasian. Elamo-Dravidian speakers may have been the first to establish city life, in what would eventually become the Indus-Valley or Harrapan civilization. They would eventually be displaced by a joint effort of Ural-Altaic, Lappoid or Turanid and perhaps especially Indo-European, Aryan invaders, however. In the meantime, though, civilizations in the Levant and then across the Middle East would rise up, representing both the Afroasiatic and Eurasiatic branches of the Nostratic language family. Similar to the Aryan takeover of the Indus-Valley civilization, the Gutians of the Zagros Mountains would descend upon the Sumerians and establish themselves as rulers.

Interestingly, the Sumerian language has been claimed among many of the Nostratic and Dene-Daic languages, from Indo-European, Kartvellian, Ural-Altaic and Dravidian to Sino-Tibetan and Austroasiatic. This is exemplary of the sort of convergence that often took place and led to new languages. L.A. Waddel held that the Sumerians were Aryan Indo-Europeans. This may have resulted from such a convergence. Their pottery does at times have swastikas on it, a symbol often associated with Aryanism (but that is also found among Puebloan peoples in America). More recently, Gordon Whitaker has argued for an Indo-European presence within Sumerian, which he deems "*Euphratic*." Upon abandoning Sumeria, some of the remaining Sumerians relocated to Samaria in Northern Israel

---

[811] Yarker, 9

[812] Among them the Catacomb people, Srubnaya (Timber Grave), Tumulus, Corded Ware, Urnfield, Hatvan, Sintashta, Yamnaya, Rigvedic, BMAC (Bactria-Margiana Archaeological Complex), and many others. Bronze Age civilizations include those that were in Mosopotamia, Egypt, Turkey, and India, and later China, along river systems such as the Tigris-Euphrates, Nile, Balikh, Indus, and Yellow, and included city civilizations such as Uruk, Faiyum, Gobekli Tepe, Harrapa, and Luoyang as well.

and to Samara in Ukraine. It is likely that the Shasu, a Hebrew component later called *Samaritans* in Samaria, were related in some way to the Sumerians of Samarra as well as the Samara culture.

The larger grouping of the Indo-European languages, as spread by the Kurgans, was first hinted toward by European travelers to the Indies, such as Thomas Stevens and Fillipo Sassetti, but was first strongly suggested— though under the name of *Scythian*— by Marcus Zueris van Boxhorn, while others such as William Jones would continue to suggest similar conclusions. Modern *linguistics* and *philology*, the study and comparison of languages, have their origin in the work of people such as William Jones. It would be Thomas Young, however, who would give the name *Indo-European*, though Conrad Malte-Brun's *Indo-Germanic* is considered to be a synonym.[813] Various ideas exist to explain the origins of the Indo-European languages.

Contrarily, the Northern European hypothesis of Karl Penka, Hermann Hirt, Gustaf Kossinna, and others, holds that the Indo-European languages developed natively among the Scandinavian and German inhabitants, usually understood to be of Cro-Magnoid stock, of Old Europe. Theo Vennemann suggests that Vasconic—often attributed to Cro-Magnoid or "Basal Eurasians"— is a significant substrate to the Indo-European languages, a position called the *Vasconic Substrate Hypothesis*. If so, this likely represents a subjugation of native Europeans by Easterly sources such as the Yamnayan-derived or otherwise pressured-Westward peoples and those following the same pattern with the Scythians. Vennemann suggests that the Vasconic languages had been superceded by Semitic or "Semitidic" languages he calls *Atlantic* he associates with early Mediterranean seafairers, also a component in Celtic and Germanic.[814] While not the entire story, there does seem to be a deal of truth to these ideas, and Cro-Magnon language likely contributes to a native substrate, similar to the role of what might be considered "old Celtic," of the Halstatt culture, may have played in relation to the advance of "new Celtic" by invaders such as the Cimmerians, part of the Scythian complex.

Anatolia is another important location from which the Indo-European language is likely to have emanated from—perhaps with people such as the Beaker People, though its original proponent, Colin Renfrew, has since modified his position, suggesting that a "pre-proto-Indo-European," rather than the proto-Indo-European language, had its home in Anatolia. Renfrew suggests that the spread of the language followed the spread of Neolithic farming. Anatolian hypotheses often evoke the presence of the Hittites, quite possibly as one of the earliest splits from what would become the Indo-European languages. The Hittites, interestingly enough, are also understood to have been practitioners of common law, and held to the rule of law in the *Pankus* (assembly), such as may have been inherited later on by the Scythians and Saxons, both Indo-European speakers.

Another possibility, inspired by the Armenian hypothesis of Tamaz Gamkrelidze and Vyacheslav Ivanov, is that the Indo-European language was already present among the Kurgan peoples of the Kura-Araxes and spread from there to the Yamnaya, before they spread it to the rest of the world.

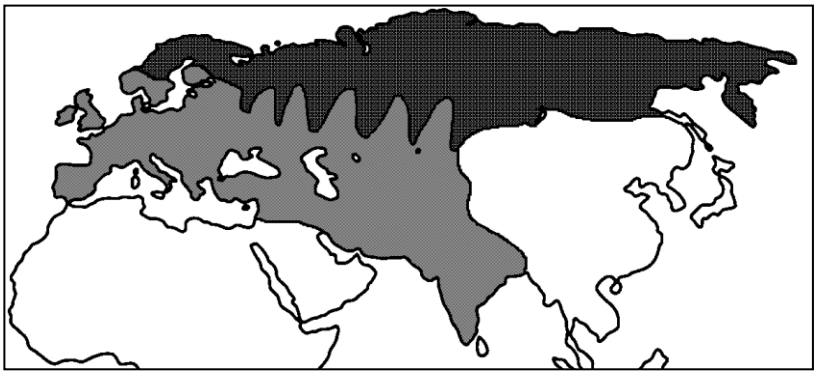
Indo-European, if the Dene-Nostratic synthetic origin is correct, may represent a synthesis of ultimately native Vasconic or Atlantean languages, Zarzian-derived elements from the Zagros, and Natufian elements from the Levant, Zarzian perhaps representing a Dene-Daic element and Natufian a Nostratic

[813] One that makes sense when considered along with the Jat Belt, discussed in detail later, which may have extended from the Indies to Scandinavia

[814] He says that the Atlantic is a Semitic or Semitidic language substrate in the Celtic and superstrate in the Germanic that came from the Phoenicians and had been laid atop the Vasconic languages, followed up by the Indo-European, over which it laid itself atop in Scandinavia and then from there the rest of Germanic. However, another likely source of the Semitidic component is from the original Hebrews and the later Goths.

one.[815] The Zarzians and Natufians had participated together in the Mousterian stone tool industry, associated with Neanderthal, especially composed of handaxes (though the Zarzians were also associated with *burins* or microliths as are found in Asia), and the Kebaran, which made use of microliths. Zarzians and Natufians had, likewise, learned something about proto-horticulture from the Kebaran culture, and so share some things in common, being essentially two wings of a larger cultural complex. Another element that may be thrown into the mix, however, may be one from ancient America. It may be that the Na-Dene speakers or others in America, or perhaps their ancestors, had contributed to the Dene-Daic family from out of North America upon their reaching of the Caucasus.

Bal Gangadhar Tilak wrote a book called *The Arctic Home in the Veddas* wherein he put forward the idea that the Aryans had their home in the North Pole. This is unlikely to explain the Aryan's Kurgan Expansion, which Marija Gimbutas has established so strongly, except perhaps as a reaction to a prior Ural-Altaic expansion from the Old North Pole in or around Alaska or Yakutsk by Lappoid Hyperboreans, which would have had an effect on Indo-Europeans as the intermixture of Ural-Altaic and Caucasian (both Mediterranoid and Caucasoid) peoples in the Painted Pottery People. Such an expansion might lead to the combination of these two otherwise separate groups, separated by Movius's Line (which would become the Jat Belt), forced to connect, perhaps, because of the drastic change in climate.



General range of the Hyperboreans (dark) and Aryans (light) with suggestive intermixture

If the paleo-Amerindians had evolved natively in the Americas,[816] perhaps in South or Central America, and had come from Out of America into Eurasia by way of Beringia, becoming the Ancient North Siberians or Yana people, they would certainly have had a great effect on the Lappoids, or proto-Uralic Siberan people, remaining most strongly today in groups such as the Sami, Nganasans, Nenets, Kets, Nivkh, Selkup, Chukchi, Ainu, and so on. The Sami, for instance, are known for their being reindeer herders. Their distant relatives, the Kets, who also used to breed reindeer, speak a language that is related to Navajo, the Amerindian language in the Na-Dene language family. It is likely that the reindeer that they herd are derivative of the caribou of North America and may have been herded, along with moose, mammoth, and other megafauna across Beringia from Out of America where the Yana people, also known for their being reindeer people, established themselves in Yakutsk. Like the Yana, though nowhere near as prevalently, they have an occasional occipital bun. The Nivkh speak a language isolate that has been compared to the Algic languages of North America, such as the Algonquin

[815] This alludes further to relationships between the Gutians and the peoples of Austronesia, as Austric is a part of the Dene-Daic language complex

[816] Either from a relative of *Homo habilis* and *Homo floresiensis* or *luzonensis* or otherwise from *Homo erectus* or *heidelbergensis* having discovered America for the first time

languages of the Hopewell people in Northeastern North America.[817] The Selkup reindeer breeders probably originally spoke a Yeniseian language like the Ket, which has been related to the Na-Dene languages, before a Samoyedic superstrate was accepted. Many Siberians, as well as Lapps, interestingly enough, live in what would be recognized by Americans as teepees, and their reindeer are along with caribou in the subfamily of deer called the *Capreolinae* or the *New World Deer*, suggestive of their origins in North America.

Carrol Quigley, however, suggests the other source for Mongoloid people and their languages, as well as for the proto-Turanian Lapp, and in strong relation to the Caucasoids. He says that a

> mixed group that followed the reindeer Northeastward [...] may be called by the linguistic term *proto-Finnish*. These were the linguistic ancestors of the Ural-Altaic languages such as Finnish, Turkish, Magyar, Mongolian, and probably Chinese [...][818]

Who might these people have been? Quigley does not say in any detail. It is likely, however, that Capoid people contributed greatly to the cold-fairing peoples of Eurasia after having taken to the mountains and to the arctic, as is suggested in the DNA of the Siberian remains Mal'ta Boy. Capoids— particularly archaeological specimens— and Mongoloids have a similar dental structure, involving shoveled incisors (these are less common in modern Capoids). This may suggest some relation, perhaps a break in the distinction between Capoid and proto- or paleo-Mongoloid, or otherwise convergent evolution. Coon says,

> Were one to classify human races on the basis of teeth alone, it would be easy to place the Mongoloids and Capoids in one category and all the other races in another. Differences in the incisors and canines alone, without reference to the cheek teeth, widely separated the Mongoloids from the Caucasoids, and as we shall presently show, these racial differences in tooth form go back as far as we can trace the ancestors of man.[819]

It appears that some of the Capoid people, if not a motley crew of all of the existing Atlantean races (including Mechtoids and perhaps some Levantoids), had traveled up toward Siberia and Mongolia, as seen in Mal'ta Boy, and likely to Tibet, perhaps signifying an Atlantean retreat to that location, home to much Denisovan genetics. Tibet, in such a case, could be a refuge of Atlantean secrets.[820] The remains in Kostenki show some relation to Mal'ta Boy, but, unlike Mal'ta Boy, not to East Asians, suggesting that Capoids may have contributed separately to each population in the manner of genetic drift. However, this was not likely in large enough proportion to establish a significant substrate, and most of their evolution likely took place in the then-Sahara Savannah, before retreating upon its drying up toward the South, where they are mostly found today. It is my conjecture that these Capoids had made some contact with Denisovans prior to this back-migration, wherein they mixed with Cro-Magnoids as Western Hunter-Gatherers and with Caucasoids (or Alpinids) in the Caucasus Hunter-Gatherers, and that they had brought back with them to Africa Siberian Lappoid or Americanoid beliefs relating to the Arctic Circle (which was then near Alaska) or contributed Shamanic beliefs to the Siberians. The Siberian peoples they met and mixed with would come to be known as *Hyperboreans* due to their proximity to the North Pole. Some characteristics of Lappoids— such as the Sami and Finns— and of

[817] Algonquin are Lenapids. They are called by Yuchi "the Old Ones." The Yuchi may have been among the mound builders. They are Sun worshippers, live in pit houses, and have a Hebrew connection by way of the Hebrew-inscribed Bat Creek Stone, but are not Israelites (proto-Israelite Hebrews).
[818] Quigley, 189
[819] Coon[1], 364
[820] Grimaldi Man shows that Capoids had also made their way into Europe.

Mongoloid may be derived from Capoid.[821] It has been genetically demonstrated that Lappoids and other Uralic people— considered to be proto-Turanid in origin, but also known as *East* or *North Eurasian Hunter-Gatherers*— have admixture with what appears to be a back-migration by relatives of Mal'ta Boy. The Ancient North Eurasians—the Lappoids— would mix the Cro-Magnoids and Ancient North Siberians with the largely-Capoid Eastern Hunter-Gatherers, and Neanderthal, contributing to the pale skin of their fellow Europeans and North Asians.

The Lapps, or Sami people, represent perhaps a proto-Turanian or Ural-Altaic people. What may be called *Boreans* (perhaps with proto-Caucasoid and proto-Mongoloid wings)[822] had diverged or separately converged into Turanids and Lappoids and Mongoloids. Today, one finds that the Westerly branch of the Turanids (or paleo- or proto-Turanids) or Lappoids, found in people such as the Finns and the Sami, have maintained fairer skin tones similar to the Nordid peoples of Northwest Europe, or sometimes ruddy skin similar to the Alpinids of the mountain zones and like many of the Samoyedic peoples found around the Ural Mountains (that form a boundary between Europe and Asia). Lappoids, in their relation to Hyperborea, may represent an independent source of light skin that has since emanated throughout Europe.

The superstrate to the Indo-European languages, with this considered, seems to have begun with the takeover of Nostratic Alpines, South Caucasoids, and perhaps Northern Turanians,[823] as well as the ancestors of the Dene-Daic North Caucasians and the Sino-Tibetans, by Ural-Altaic Hyperborean (North Turanian) forces (perhaps related to the Na-Dene speakers of North America); or otherwise involved some sort of mutualistic fusion between these elements, making it clear that Nostratic languages have a Northern and Southern root, a Hyperborean and Afro-Kartvellian one (from which Semitic would evolve and Indo-European would deviate upon mixture with the Ural-Altaic). Frederik Kortland, for instance, had suggested that the Ural-Altaic family of languages may have been the source of the original pre-Indo-European language, which had been influenced by the Caucasian languages to become Indo-European.[824] Both of these cultures, the *Hyperboreans*— proto-Turanians speaking Ural-Altaic languages— and the *Caucasians*—possibly Kura-Araxes or Maykop people speaking Circasian or Kartvellian languages—, and possibly aware of a long-ago split between them, would come together especially North of the Caucasus and conquer the world together as the Yamnaya or Aryans.

That Indo-European likely comes from a mixture of Ural-Altaic (Nostratic, Eurasiatic) and North Caucasian (Dene-Daic) languages is an idea that is supported by people such as Frederik Kortland and Allan Bohmhard, while Afro-Kartvellian is another likely influence. This, again, suggests perhaps the conquering by Ural-Altaic peoples, proto-Turanids, of early Mediterranoids and Alpinids, and the

---

[821] While the Cro-Magnoid and Mediterranoid phenotypes would come to dominate Europe, in the East among Mongoloids, as well as among some Laplanders and even some Turanians and Alpines to a lesser extent, epicanthic folds and yellow skin tones or undertones may be derived, at least in part, from early Capoid visitors to Turan or the Ural-Altaic region. For whatever reason, the Capoid phenotype does not commonly shine through among Europeans, except at times in certain Mediterranoid and Lappoid hair, which may show some slight degree of peppercorning and may be a little frizzly sometimes. For the most part, it appears that the Cro-Magnoids largely displaced the Capoid people.

[822] A late adaptation of what was previously the Australoid-Cro-Magnon root followed by recurring migrations from out of Africa such as by the Mechtoids and Mediterranoids, and mixed some with Neanderthal

[823] Who, as early Turanians, had migrated in part toward the Caucasus from the Tarim Basin. As Mediteraneans they came from the West, out of Mauretania (Mauritania and Morocco) in West Africa as early or proto-Mediterranoids. Once in Turan, they were changed by their environment, becoming Alpinized or Turanized

[824] This may have brought together polar and equatorial Sun-worshippers, maybe for the first time since their having been divided, or perhaps in a perennially-repeating fashion. Whatever the case, the combination of polar and equatorial Sun-worship was likely a fairly easy one, considering other issues cultures typically face from one another.

following combination of traits, perhaps beginning with the Kura-Araxes, or Painted Pottery People or some related group. Ural-Altaic peoples, Turanians, might have been greatly affected by the onslaught of the Younger Dryas and following climate events, forcing them to migrate away from their polar, or Hyperborean, homelands. Remnants of this migration, possibly from Yakutsk or even Alaska, might be found in the Ural-Altaic peoples of Europe, such as the Sami, especially, but also the Finns, Estonians, and Hungarians, leaving behind the Samoyedic, Permic, Volgaic, and others along the way.[825]

The population of Mal'ta likely involved Cro-Magnoids and Capoids in retreat from Mediterranoid populations, intermixing with Northern and coastal Australoids, perhaps also involving Neanderthal or Denisovan admixture. This may compose some degree of the original constitution of Lappoids. The Mal'ta population is considered the origin of Ancient North Eurasians, and genetically related to Eastern and Scandinavian Hunter-Gatherers (Cro-Magnoids and Lappoids, Sami), Western Steppe Herders (proto-Nordids, Yamnaya), Amerindians, and the Jomon people— is understood to have been the source for blonde hair, which would later come to characterize Finns, the Aryans or people of Turan, and then later Nordids of Scandinavia.

The combination of Mediterranoid and Alpine (Mediterranoid plus Neanderthal) albinos with proto-Turanian whites—themselves possibly not yet pale, possibly albino but likely cold-adapted and possibly lightened by magnetism near the Pole— would also contribute toward fairer skin and "Nordicity," giving way to the proto-Nordid features of the Yamnayan Aryans, which would come to characterize the European continent, becoming even lighter upon the coming of the Nordid-proper Scythians, and acquiring blonde hair. The Yamnaya were similar to the Afanasievo culture in Siberia in the Altai Mountains, possibly proto-Tocharian, and likely came from a common source, perhaps representing movement from what is now the East and what may then have been the North, toward the Ukraine region.

We might call the Nostratic languages, minus their Ural-Altaic influences but possibly including the Dravidian, *Afro-Kartvellian*. Both the Afro-Kartvellian and the Dene-Daic spoke Borean[826] languages, perhaps mutually intelligible. They had become split into two wings, perhaps politically, later to be influenced by the Hyperboreans or North Turanians, who were Lappoids speaking Ural-Altaic (Turanian, part of Eurasiatic) languages. These would at least influence Indo-European and probably also Dene-Daic. Afro-Kartvellian Mediterraneans and Alpines were Kartvellian, South Caucasian language-speakers (or both). The North Caucasians and Sino-Tibetans were proto-Caucasoid or early Mongoloid Dene-Daic speakers, perhaps, or possibly early or proto-Mediterranoids,[827] possibly coming

[825] Other peoples, such as the paleo-Siberians, and the ancestors of the Jomon or Ainu especially, and possibly what would become the Kipchak, Eskimo-Aleut, Tungusic, Mongolic, Koreanic, and Japonic peoples, may have also been affected by the Younger Dryas impact event. Also immediately impacted would have been early Scandinavian, Western European, and Alpine populations, and those of Northwest Africa. Certainly any peoples in Alaska, Upper Canada, or Greenland would have been devastated. There are accounts, however, from the Heiltsuk people of having lived through the last Ice Age in a warm pocket in Eastern Canada, a claim that has been confirmed by archaeological investigation. The Heiltsuk are a potlatching, seafaring, and totemic people, whose religion is strangely evasive to study. These people share craniological features similar to the Ainu and Polynesians and have an aesthetic reminiscent of people of the West Coast, such as the Tillamook, which are also similar to some Central and South American and Oceanic cultures.

[826] *Borean* means "Northern," while Austric languages come from near the equator, giving an interesting dynamic to the label

[827] Carroll Quigley holds that Mediterranoids had mixed with Neanderthal, forming Alpinids and Turanids, from whom he says Mongoloids and Amerindians come. He also holds that Neanderthal had been on the retreat toward Siberia. Proto- or early Turanids, perhaps the same as proto-Mediterranoids, had moved Northward from their location in or near Turan, whereby they would have intersected Neanderthal near the Ural Mountains, perhaps bringing those genetics back with them to the Caucasus (where they were likely already present as well). Part of

from out of Tibet, China, and or Southeast Asia such as in Malaysia. These Afro-Kartvellian and Dene-Daic Boreans had likely known each other to some extent. In fact, this event may have been a reflection of a prior conflict between what we might call *Mauri* and *Maori*, two branches of the Atlanteans. In other words, it may have involved the Mauri— relatives of Polynesians and Peruvians in Northwest Africa— and proto-Austric peoples. The proto-Austrics might have taken to the Big Man system and the system of buying and selling similar to the Kapauku,[828] while the Mauri had preferred a grade-taking or chiefly system, or perhaps a system of judges as is depicted existing among the Hebrews. The macrogroups *Dene-Daic*[829] and *Nostratic* are both branches of the Borean languages, derived from Hyperborean-Zarzian and Hyperborean-Natufian sources, Hyperborean elements probably from paleo-Amerindians. This suggests that the Natufians and Mauri might be associated with the Nostratic languages, while the Zarzians and Maori might more readily associate with the Dene-Daic, or perhaps just the Daic. The Hyperboreans would likely have contributed to both Dene-Daic and Nostratic, and may also have been of some relation, perhaps by way of groups such as those possibly ancestral to the Jomon and Tlinglit, such as the Yana or the Solutreans, perhaps even partially derivative of the paleo-Amerindians.

If we make use of a conflicting definition of *Borean*, one not as a language family in which this variety of Borean fits (taking its name from the influence of Hyperboreans on both Dene-Daic and Nostratic to their South)— but a people described by the Greeks as *Boreans* for inhabiting an area called *Borea* (the area influenced by the Hyperboreans outside of Hyperborea), the Mauri-Maori conflict might also be described as one between the Boreans and the Atlanteans, the *Boreans* then (with the new definition) being the Dene-Daic-speaking Varna-like people[830] and the *Atlanteans* being the Nostratic-speaking Mauri-like people. They were probably racially related and shared a general Mediterranoid phenotype, resulting from admixture of Austronesian with Basal European and Turanid, though would drift over time into a more clear distinction between Turanid and Austrid, like that between Mediterranoid-proper, the Mauri of Mauretania, and "pseudo-Mediterranoid," the Maori of New Zealand.

The myth of *Prometheus*— the Titan Trickster who stole fire or wisdom from the gods and gave it to humanity— might tell of a time of interaction between the Atlanteans, or Cyclopians, and other Boreans, the Boreans of the Greeks. Indeed, the myth of Prometheus takes place near the Ural Mountains— wherefrom some of the Turanian people went before heading back toward the Caucasus—, and among the one-eyed Arimaspi, beyond which live the gold-hoaring griffins near the Cave of Boreas, with the Hyperboreans living beyond the Boreans. In the myth, the Titan-descended Prometheus helps the Olympian Zeuss in his struggle against the Titans during the War of the Titans, only later to rebel against him by giving to humankind the ability to make fire, something that was before only known to

---

this population would continue past the Ural-Altaic Mountains and mix with Australoids who had traveled up the coast of East Asia, contributing toward the Jomon and Ainu people and likely Amerindians as well, perhaps being of some relation to the Hyperboreans who were said by the Greeks to live beyond Scythia and the Ural Mountains.

[828] These proto-Austric peoples were perhaps Austro-Melanesians or early Austronesians who had taken to elements of the political economic systems of people such as the Kapauku in New Guinea— as seen by the gold penis sheath on the corpse in the Varna Necropolis—, likely representative of the Dene-Daic speakers, and perhaps prefiguring the *Mandala* political system—a proto-feudal system developing from gift-giving relations— to some extent as well. The Kula Ring seems to have elements similar to the proto-feudal Mandala system of the Austroasiatics, as well as to the feudal system in Europe involving the exchange of crown jewels and other purely symbolic items, suggesting that, despite their differences, they would both eventually re-converge on a system of feudalism, come the Iron Ages.

[829] Dene-Caucasian plus Austric

[830] The Varna were likely Austromelanesid or some mixture thereof, Australoids at large having migrated along the Eastern shores of Asia and probably into Alaska and beyond, as suggested by Kennewick Man's phenotype, among other reasons.

the gods. For this, Prometheus would be chained to the mountains in Scythia. For many, Prometheus, in his sharing the wisdom of the gods with humanity—fire representing Wisdom at large, and not just the wisdom of how to make it—, represents the first heretic, radical, and revolutionary, perhaps second to the closely-related Lucifer, who was said to have led a revolt against what some say was the Demiurge and who others say was God, either way named *Zeuss* or *Deus*.

The reconvergence of the Borean languages, of the South Caucasian Kartvellian languages, the North Caucasian Circassian or Caspian sorts, and by extension of the Nostratic and Daic, with the Hyperborean elements, possibly related to Na-Dene, would result in the Indo-European languages, the most widely-spoken language group existing today, covering most of Eurasia, the Americas, and Australia, among others. The widespread success of the Indo-European languages owes itself to the synthetic or fusional nature of the language group. Semitic, another Nostratic language, is another that benefits so; Sino-Tibetan, in the Dene-Daic group, is also diverse in its makeup. The major language groups of Europe— from Latin and the Romance languages, to Celtic and Germanic languages, as well as the Greek and Slavic languages in the Balkans and into Ukraine— fit into the Indo-European language category, part of the Eurasiatic branch of Nostratic. The Indo-European grouping extends past Europe into Russia and India, even, but is punctuated by various languages—chiefly Turanian, Caucasian, and Semitic languages— along the way. The Middle East and North Africa speaks chiefly Semitic— a Nostratic, Afroasiatic, tongue—, such as Arabic; with some Turanian languages, such as Turkic; as well as others— among them Indo-Iranian, a sub-branch of Indo-European— as well. However, the Caucasian and Kartvellian languages are also present, especially in the Caucasus. East Asia, as well as the Caucasus, speak the Dene-Daic groupings of Caucasian languages, the Sino-Tibetan languages— as is prominent in China and much of East Asia— , and the Austric languages, which include the Austronesian and Austroasiatic languages. Northeastern Asia, however, is full of Nostratic, Eurasiatic, Turanian languages, such as Tungusic, Mongolic, and Turkic.

Some of the most Southeastward expansion of the Indo-European languages extends into and around Tibet and the Himalayas. For instance, Nepal is largely Indo-European, being home to Khas or Khasas people, such as the Pahari, also found in the Himalayas as mountain people.[831] The Drokpa people are indigenous Indo-Europeans to Tibet. Afghanistan near the Khyber Pass is home to *Dardic* peoples— Indo-Aryans of the Pakistan and Kashmir area— such as the Kalash, and India has Dardic people such as the Brokpa.[832] Perhaps related to both the Drokpa and especially the Brokpa, and also found near the Khyber (and Shandur) Pass area, as well as in the Gilgit-Baltistan Valley, are the *Burusho*, a non-Indo-European, Dene-Caucasian-speaking people recorded by Tibetans whose language is nonetheless the source for such words as *apple* and *Abel*. The Burusho have genes from Levantoids, South Mongoloids, proto-Nordids, as well as Sibero-Tungids.

Hybrids and Convergence Zones

The failures and successes, or the declination and expansion, of the various races and cultural groups has much to do with climatic factors involving the change of seasons in the Great Year. Placental mammals and then primates, too, are understood to have developed first in the North Pole regions, the steppes, and in the Tibetan plateau, before then becoming dominant across the world as it started to cool, spreading from the North Pole, Siberia, and Tibet throughout the rest of the land. Similarly, there are various ideas involving archaic proto-Mongoloidal and proto-Caucasoidal peoples inhabiting the

[831] They have been pushed down in caste because of neglect of Brahmanas, along with the Saka, Dravidians, and others

[832] Some have tried connecting the Dards to the Trojans or Illyrians

Northern regions and mountains together and expanding therefrom as well,[833] all of which have been used to explain the present dominance of light-skinned, Northerly Caucasoids and Mongoloids—such as the Indo-European Celtic and Germanic and the Sino-Tibetan Han and Tungusic Manchu people— over the rest of the population, over whom they have largely established caste and class systems or have otherwise relegated to the refugee zones of the world, the dry deserts, cold tundra, and islands.

Cold and dry periods serve to isolate species into pockets of relative warmth between glaciers and tundra, and to divide them across barren desserts. Carroll Quigley says that "we may picture the glaciers as a great piston that advances and withdrew four times, expelling populations from Europe as it advanced and sucking it back again from Africa as it withdrew Northward." But, he says, "glacial advance not only consisted of a Southward advance of the polar ice-cap; it also consisted of a downward extension of the snow line on mountain peaks."[834] Caucasoids and Mongoloids— possibly already coming from proto-Monogoloidal and proto-Caucasoidal fusion at or toward the pole (in Kamchatka, Siberia, and Scandinavia) and mountain-tops (Alps, Caucasus, Altai, Ural, etc.) during periods of relative warmth, coming themselves from prior cold periods, and so sharing a common arctic or Hyperboreal, and perhaps a highland Caucasian-Uralic-Altaic heritage—, would find themselves, or at least portions of their people— Lappoids or proto-Turanians, perhaps—, pushed out of the North and the highland zones by advancing glaciers and thereby trapped in valleys, wherein they survived the Ice Age. While trapped in the valleys, isolation prevented the flow of genes between an otherwise contiguous, though nonetheless already locally-selected, population. Isolated deselection of genetic material would result in racial or subspecial divergence by way of genetic drift, causing an increased difference in phenotypes. Any new mutations would also find themselves isolated to the population and selected or deselected by the environment. Cold weather would apply pressures for the development of epicanthic folds, eyelid hoods, and slants which help to see in the snow and to prevent snow-blindness, as well as for the development of white skin— a decrease in melanin— and lactose tolerance, both of which helped with acquisition of vitamin-D in environments with scarce sunlight. Finns and Sami people in Europe—Turanian, Lappoid, or East Baltic Caucasoid— and Mongoloids in Asia share in some of the eye shape, while Nordic Caucasoids share with them in light skin tone. Mongoloids are also identified by prominent cheek bones and "shovel-shaped" incisors. Mediterranoids, Caucasoids, and Monogoloids are characterized by having relatively flat faces, with Mongoloids in specific verging toward the extreme. Mediterranoids have thinner, more protruding noses, an adaptation to dry and warm air, while Mongoloids have flatter, wider noses for life in the cold. This is due to sculpting by the environment, as well as to sexual selection.

Many peoples, themselves having evolved from ancestor-worshipping cultures, have stories of having abolished their ancestors or their gods to the mountain-tops (or even the stars). The Ancient Greeks, for instance, held that their god, Zeuss, lived atop Mount Olympus. Naturally, these ancestors are peoples from whose control one's cultue has diverged, and who have been pushed from out of their homeland, having had to "run for the hills," where they apparently stayed. This contributed greatly to the highlands as being genetic and cultural convergence zones, wherein refugees might come across such older versions of themselves that they begin, even, to have tales of Yetis and other Cryptids, perhaps relatives of more primitive primates such as *Gigantopithecus*. More recognizably human phenotypes, such as Neanderthal and Denisova, might likewise have taken to the hills as the weather warmed and as the Eastern wing of Austro-Cro-Magnoid advanced into Europe from out of India and the Middle East. Their genes would meet with the proto-Turanid, Lappoid, and early Alpinid Caucasoid peoples of the

[833] These peoples might include the Hyperboreans and the Kurgan or Aryan raiders following the end of the Younger Dryas, or the Nordics
[834] Quigley, 184

mountain regions, passed on also to the Mongoloids. Arctic zones, steppes, and plateaus are likewise areas of refuge from established and advancing societies and of convergence, as are deserts. Neanderthal and Denisova certainly followed the receding glaciers, where they were eventually followed by paleo-Siberian and then Ural-Altaic peoples such as the paleo-Siberian and proto-Turanid ancestors of people such as the Sami, Ket, Selkup, and Nivkh. The San !Kung have taken to life in the Kalahari Desert.

It's interesting to mention also that the various Eurasiatic peoples who have spent a significant time in Asia have tended to develop Asiatic or Mongoloidal features, likely on their own as a matter of environmental selection, perhaps including forces of biological structuralism[835] or morphogenetic fields[836] that exert themselves on the phenotype. The Drokpa people of Tibet, for instance, have a good measure of Turkicization, likely owing both to intermixture and to local adaptation similar to the Sakha, or *Saxa*, of Yakutsk, derived from the Saka of the Scythian cultural complex, who also show a good deal of Turkicization, in part from admixture with Tungusic and other Mongoloidal peoples, but largely from local adaptations. The European races, perhaps coming especially from albino convergence of mountain, steppe, and even island peoples, including the Mediterranoid, the Alpinid, and the Nordid as well as the Turanid, whose anticipants, or at least their geneflow,[837] would move Eastward and develop, converging with other subspecies along the way— such as various late Asian *Homo erectoids*, Neanderthals, and Denisovans— sometimes into the Mongoloid. Any people who stays long enough in a given area, or who does ebough intermixing, will tend to develop, whether natively or through acquisition, features consistent with the pressures found in that area, either by way of adaptation or by way of retention of favorable genes gained by local populations and shared around the group. This is how the Saka, who had ventured into East Siberia, became the Sakha. While having began as proto-Nordids,[838] they would develop Asiatic features, becoming, both through environmental selection and by way of outbreeding, essentially fine-featured Turks or even Mongoloids themselves. This serves as an example of the environmental pressures that can be placed even upon genetic lineages, subsuming alien groups into a native racial group. Because of this, groups of common genetic origins may exhibit different phenotypes over time, making each phenotypically closer to another people who share a similar environment. "Race" does not require genetic relation, but similarity of phenotype, which may result from genetic relation, but not necessarily. Given enough time, ecological pressures will produce convergent tendencies, and hybridization accelerates this process. Those races that have had an evolutionary history involving oceanic or terranean migrations—perhaps especially herding and fishing peoples— have had an advantage both in mixing with a more diverse group of peoples and in being

---

[835] As was proposed by D'Arcy Wentworth Thompson

[836] As was proposed by Alexander Gurwitsch, and upheld by Ross Granville Harrison, Rupert Sheldrake, and Brian Goodwin

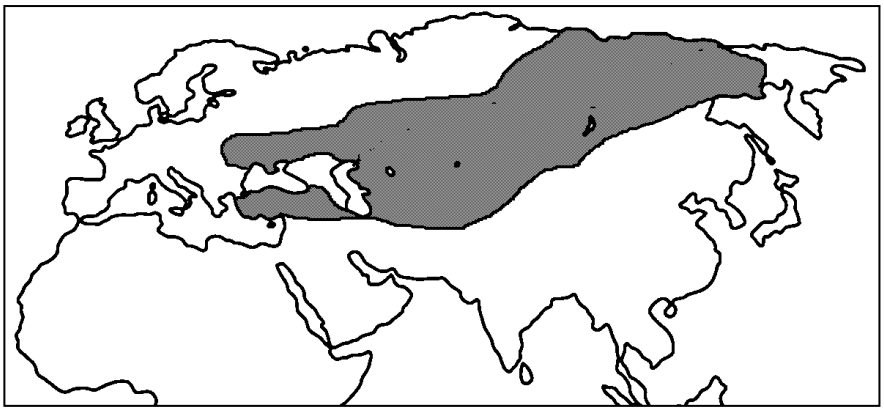
[837] It may not be correct to suggest that early hunter-gatherer populations, at-large, migrated across such vast distances and outside of their indigenous or native lands, so much as it may be to suggest that genes flowed across vast distances as they were passed along in various manners, including not only migrations, but especially sexual encounters. Migrations of nomadic peoples from outside of their normal territories did occur, especially in times of changing climate, but migrating would become especially feasible among fishing, maritime, herding or pastoral people, who could take their animals with them or even ride or be pulled by them along the way, or who could carry supplies in a boat with them and fish along the shore. It is at this point that a significant break from biological hybridization as the main locus of societal evolution occurs and where cultural hybridization, between newly encountering and otherwise distant groups, who have migrated from outside of their traditional homelands, begins to become the locus of societal evolution, driving, as Nolan and Lenski suggest, population growth and innovation in a positive-feedback loop.

[838] Perhaps derived originally themselves, or at least in part, from proto-Turkic, Lappoid, or Turanid stock coming from out of groups such as the Sintashta or Afanasievo

sculpted by a more diverse range of environments, contributing toward "hybrid vigor." The Indo-Eurafricanoid especially, and the Mongoloid as well, are races of races.

Turkic peoples may have resulted from a Turanian, Indo-European, Dravidian, Tungusic, and Sino-Tibetan convergence zone that was widespread but especially strong around Lake Baikal, in the Tarim Basin and along the Silk Road, where the Tocharian mummies have been found.[839] This sort of Indo-Eurafrican-American-Mongloidal convergence would produce unique Turkic phenotypes, perhaps recombining toward something like the Turkic-featured Drokpa or Sakha. As Carleton S. Coon remarks,

> in central Asia North of the Himalayas Caucasoids merge into Mongoloids through the persons of several Turkic-speaking peoples like the Kirghiz, Uzbeks, and Turkomans. This clinal zone is a broad one.[840]



General range of the Turkic clinal zone

It's important to understand that phenotypes, such as those of Caucasoids, Mongoloids, and Turks, are not necessarily insular groups of familial or linear relation, but are better understood as ecological convergences and hybridizations. People of a given race do not necessarily share strict a genetic history, though they will certainly show genetic interrelationship due to the scrambling of genetics in convergence zones or from super- and substrata of conquering and conquered peoples. Two races, for instance, may converge and hybridize in a given area.[841] Each will pass its genes along, with those genes being selected by the environment, choosing from the basket presented to it. A third race may come in, bringing similar genes that developed independently, by way of convergent evolution, to perform the same role, and may compete with similar genes, such that both genes remain present in the population.[842] While there are many cases—as with the prolific nature of Genghis Khan and his offspring, or due to various "bottleneck" events— wherein populations will share much genetic heritage in common, the environment will continually select from genes brought in from outside of this "pure"

---

[839] A Dravidian-looking mummy has been found in the Tarim Basin, alongside Turanian, proto-Nordid, and Mongoloid people, potentially proto-Tocharian. There had similarly been racial and cultural convergence at Loulan, which meets the Tarim Basin, and was an important location along the Silk Road.

[840] Coon[1], 18

[841] Perhaps becoming tied together mythologically to a small few founding figures, from whom some genes of the group may be derived, though certainly not all

[842] There are many genes for white skin and lightening, for instance, and so long as two genes perform the necessary duties needed, and are found sexually favorable, they will both continue to persist. Thus, while Europeans may be considered to be white people, they are not necessarily "white" due to the same genetic heritage, but instead represent a common, intelligent design that emerges by way of convergent natural selection. The same is true of all of the human races.

population and will tend to dilute it with genes performing similarly. Thus, while we may recognize phenotypes in the various races— the Australoid, Capoid, Mediterranoid, Caucasoid, Mongloid, and Congoid—, these phenotypes do not represent absolute inbreeding. Instead, they represent Nature's priorities, which She will impose on any and every people who decides to relocate to a new ecosystem. Albinism, for example, is something that occurs independently in every race (having also been associated with a history of shunning), which— along with protection from the heat of the Sun— might lead one to take refuge in the highlands, later taking to the Northerly ranges and steppe regions as well, leading to a convergence of different people based upon their shared needs.

The biggest political player in East Asia today, and for millenias passed, is China. Perhaps the most well-recognized and the ruling ethnic or racial group of China is the *Han* (including the Cantonese), known also— especially with admixture with Mongols, and in the West— as the *Huns*, a Sinid people. The *Huns* were, like the Tocharians (who were the Easterly wing of the Celto-Thracians), the most Westward presence of the Han Chinese. The Huns, themselves, are related to the Chinese Han people, though the more Westward Huns sometimes went by the *White Huns* due to their having more European genetics, perhaps an example of Turkization. They had more admixture with Sibero-Tungids, Lappoids, and proto-Nordids than did the Han-proper, and have been considered by some to have been an Iranic people. It is possible to speak of the White Huns as an Iranic-Turkic,[843] headpressing, and hypsicranic cannibalistic tribe from the Caucasus who joined with the Huns (Han) and hammered into Europe becoming rulers and influencing Germanic tribes, spreading head flattening to Ukraine and the Levant. The *headpressing*—artificial cranial deformation also known as *elongation of the head*— and *hypsicrania*—or "tall-headedness"[844]— is reminiscient of peoples from the Americas, such as those exhibiting some Otamid traits, but especially those of Paracas (who also exhibited some Otamid characteristics, but who, unlike Otamids-proper, who were known to be slope-headed, were hypsicranic and skull-binding). Similar connections have left some fringe anthropologists such as Brian Foerster to hypothesize that these populations may be related somehow, as he connects the Andean peoples to those of the Caucasus and the Black Sea. Could the Sea Peoples who attacked in the Mediterranean have been relatives of the Paracas? Other ethnic groups in China include the Altaic-speaking Tungusic[845] Manchus and the Mongolians, and the Sino-Tibetan and native Chinese Mandarins, and hundreds of others: South Asia, like sub-Saharan Africa, has hundreds of ethnic groups and sub-ethnicities, many of whom have a presence, though often quite uncomfortably, in and around China, speaking Dene-Daic languages primarily.

Through the various Uralic migrations and Hunnic, Mongolian, and Turkic invasions, Mongoloid genetics have also found their way into the races of Europe. This is especially so of Eastern Europe among Slavic people, and is especially concentrated in areas such as Hungary, which takes its names from the Huns. Finno-Ugric, Uralic peoples, such as the Finns and the Laplanders, or Sami, may also have some proto-Mongoloid genetics due in part to some mixing with Samoyedic peoples and others,

---

[843] Among the Huns were also some Germanic peoples such as the *Gepids*, likely a faction or derivative of the Getae or Goths. However, the Gepids would turn on the Huns.

[844] The Caucasus area and the Pontic Steppe to the North of the Black Sea are areas where hypsicrania is found fairly commonly, such as among Pontid and some Slavid populations. This corresponds to areas where artificial cranial deformation was practiced, suggesting perhaps that such a practice may have corresponded with a particularly high head vault. A map of hypsicrania from Human Phenotypes shows the condition to be prevalent, by order of magnitude and size, in South America, North America, China, Mainland and Maritime Southeast Asia, Indonesia and some of New Guinea, the Polynesian islands, the Pontic region, the Saharas and portions of West Africa, Madagascar, Southern Spain, a portion of Northern Scandinavia corresponding with the Western portion of Lapland in Norway, and Hungary.

[845] Tungids likely originated between Manchuria and Lake Baikal, not entirely too far from the likely home of the proto-Sino-Tibetans in South Siberia

but mostly sourced in proto-Mongoloid proto-Turanians or Lappoids, from which both the Turanid and Mongoloid peoples would largely, but not solely, be sourced.[846]

Aside from the Turkic zone, Oceania and maritime Southeast Asia represent another strong zone of convergence, this time based around island life, having Australoid, Mongoloid, and even some Caucasoid (Tamil) and perhaps Congoid (Negrito) presence. There is also a clear indication of Australoids having been pushed from the mainland of South Asia by Dravidians, only to be followed by the Dravidians into Sri Lanka and outward into maritime Southeast Asia and Oceania. Whether Polynesian Mongoloids and Congoid Negritos have similar stories, I am not aware, but I would not at all be surprised if that is the case. Similarly, *Nesiotids*, who may be an input into the Mediterranoid phenotype, may follow a similar story. Perhaps they, like Caucasoids, converged from out of retreating albinos.

While American Indians are typically considered to be the offspring of Siberians, these Siberians, proto-Lappoids or proto-Turanids, themselves are likely to have had some interactions with Indo-Europeans and other Caucasoids before having crossed the Bering Strait into Alaska, from which they are likely to have spread. Also, the Americas may have been more of a convergence zone than might be expected, having perhaps received visitors more directly from Europe, such as the Solutreans, and from Austronesia and Polynesia, as is evidenced by genetic testing and by the existence of non-native flora and fauna and materials as a result of trade. Researchers such as Walter Neves point to evidence that the Australoids may have made it to the Americas before settling in Southeast Asia, as traits from *Luzia woman* might suggest. Buckminister Fuller, among many others, held that the Phoenicians had long visited the South Americans, and may even have been anticipated by other "sailing-into-the-wind" and against-the-currents people. Indeed, the Phoenicians mysteriously grew corn,[847, 848] upon which their entire civilization subsisted, coming alongshore to their hundred-by-ten mile strip in Canaan to farm before leaving to trade, swindle, and pillage. There are a number of stories about findings from Ancient Eurasia in the Americas as well.[849] Most of the American Indians in both North and South America have

---

[846] Mongoloids likely have genetics sourced from proto-Turanian peoples moving Eastward, as thinkers such as Quigley suggest, and from native Asian *Homo erectus* sources that had locally made the transition to *Homo sapiens* in a convergent fashion, as Coon and other multiregionalists thought. They also have some Denisovan and possibly Americanoid admixture.

[847] Chickens from Asia found in the Americas and sweet potatoes from the Americas from Polynesia suggests further contact between the Americas and Polynesia if not Asia

[848] Also showing support for Semitic contact with the Americas, Pharaoh Ramses and other Egyptian mummies have apparently been found to have coca leaves in their abdomens or show signs of nicotine from tobacco, suggesting contact with South America, where coca and tobacco naturally grow

[849] G.E. Kinkaid famously claimed to have found Egyptian artifacts in a cave in the Grand Canyon, connected to miles of underground passages. If true, this could represent a return of Joseph to the Americas, and perhaps a return of the "Lost White Brother" spoken of by some of the Native Americans. Egyptian mummies have been shown by Svetlana Balabanova to have traces of nicotine and coca from the Americas in them. Barry Fell has argued that ancient Celts and Phoenicians had visited America, using *America's Stonehenge*, or "Mystery Hill," suggested by the mainstream to be the creation of an American, William Goodwin, who promoted the site as an ancient ruin. Fell believes that the early Americans may in fact have been from what others have identified as *Atlantids*, or the "Atlantic race." Cyrus Gordon has argued that the *Los Lunas Decalogue Stone*, a stone found in New Mexico bearing paleo-Hebrew, is a Samaritan *mezuzah*, which is a document that is supposed to ward off evil or protect one's family from Passover. The *Newark Holy Stones* are artifacts discovered by David Wyrick from mounds of the Hopewell Culture that have Hebrew inscribed on them. The *Tucson artifacts*, discovered by Charles E. Manier in Arizona, are controversial artifacts that appear to be Mediterranean in origin, showing a Roman and Jewish presence in the Americas during the time of the Vikings, but have been considered a hoax by mainstream scientists. Inscriptions in Latin and Hebrew appear, including some that describe a conflict with the Toltec People of Central America. The Bay of Jars in Brazil have produced jars that are very similar to those used by Romans. The Tecaxic-Calixtlahuacan terracotta head has also been suggested to have Roman origins. Some,

been subsumed into Mestizo populations through admixture with Mediterranoids and Caucasoids. The Inuit, however, and some tribes of South America, have maintained a great deal of purity in some of their populations, such that in the case of the Inuit it might be hard to tell them apart from their Yupik kin in Asia, with whom language groups are shared between continents. Some of them notably have wandered into Europe in more recent times using ancient technologies to do so. *Finn-men*, or travelling Inuits, for instance, have been seen on the coasts of Scotland for quite a long time, being mistaken for Lapps. In the deeper past they were known as *Selkies*, or shapeshifting seal people. Their traveling in small kayaks may have contributed to legends about *merpeople*, people with half-human, half-fish bodies, as Samuel Hibbert-Ware noticed. In ancient times, the Roman Quintus Caecilius Metellus Celer had apparently been given Indians who had been set off course and drifted to the coast of Germany by a Germanic king, most likely being Native Americans, perhaps Finn-men, rather than East Indians.

Tungusic peoples, Mongolics, Koreanics, Japonics, and others are generally attributed to an Altaic origin, and have a phenotype generally more associated with East Asians. The Evenks, or Evenki, a Tungusic people, are North Mongoloids from Manchuria or the Altai Mountains who hunted pigs but later herded reindeer and displaced most of the paleo-Siberians, becoming the standard among Siberians today. They were derived, most likely, from the Evens, perhaps the original Tungusic people, known for having been reindeer riders. Their ancestors were likely among the first Mongoloids to have made contact with the original paleo-Amerindians coming from Out of America in the form of the Yana people, and their descendents would cross the Bering Strait going into America where they largely displaced the inhabitants there and divided them from the Eurasians who would develop into what I have designated to be the Lappoid phenotype, used loosely so as to include Lapps as a standard but while including Kets, Ainu, and others, as well as Samoyeds, other Yiniseians, and the substrate to Uralics more generally. In the Americas, Americanoids would continue to evolve, becoming such people as the Central-North Amerindian and Na-Dene speakers and often mixing with Australoid elements—probably coming from South America from out of an Antarctic exploration from Out of Oceania but possibly from Beringia or even Melanesia to Easter Island— and Mongoloid elements related to the Tungusics coming from the Bering Strait, possibly also Austronesians from the Lapita Culture, which may have included Americanoid and Polynesian Mongoloid phenotypes in its numbers, perhaps itself representing a relationship between the Nagas and the Aryans or something to that effect.

Agricultural and Bronze Age Society

In contrast to the Big Men and *Tonowi* dominant in Melanesian societies are the chiefs dominant in Polynesian societies and across the world, perhaps as spread by the Lapita people. Chiefs and chieftains are not only found in the Polynesian islands, but are actually quite common across the world. Even peoples as far from Polynesia as the indigenous Americans and the Indo-European tribes, such as the Germans and the Celts, would develop chieftains and chiefdoms, and likely from a foundation of reciprocity, much like the Big Man system that preceded the chiefs of Polynesia. Marcel Mauss says that social order of the primitive Pacific Islanders' sort has "provided the transition towards our own forms of law and economy," and "can serve to explain historically our own societies."[850] In societies practicing "gift" economies and potlatching, the "gifts" are often given as social obligations, used to justify the positions of those who may have better land or some other privilege. Many anthropologists prefer the term *prestation* to *gift* for such economic exchanges, as they often seem to be a means of maintaining

such as Betty Meggers, have argued for Chinese contact with the Americas, perhaps contributing to the development of the Olmec civilization. People such as Nancy Yaw Davis and James Wickersham have argued for contact between the Native Americans and ancient Japanese people, such as the Jomon with the Zuni.

[850] Mauss, 47

prestige or societal privilege within a regimented society. Such prestations may have a relationship to the formation of "*House Societies*," as Claude Levi-Strauss calls them, with noble households associated with a particular landed estate. An example of this may include the Toraja of Indonesia's *tongkonan*, or noble houses, which are won in funerary rite competitions in which status is earned through the gifting of cattle. Membership in a *tongkonan* came with privileges such as the right to rent its land.[851] Often, chieftains of various societies would associate themselves with various pagan deities or pantheons. Big Men of the tribe and chieftains, alike, would work the laws in favor of their control, but chieftains had more power to do so, gaining power over others that Big Men did not privately hold.

While Big Men, who owe their political influence to status, are established upon notions of reciprocity, chiefs, who owe their political influence to rank, are established upon notions of redistribution. The chiefly system is more command-oriented, and also more stable, while the Big Man system is less command-oriented, and less stable. William A. Haviland, *et al.*, make a distinction between tribes and chiefdoms, suggesting that a "chiefdom is a politically organized society in which several neighboring communities inhabiting a territory are united under a single ruling individual—the chief—who is at the head of a ranked hierarchy of people," and that "status in a chiefdom is determined by the closeness of their relationship to the chief."[852] Chiefs often have some power to command and, while many customs from gift economies still apply to chiefdoms, they often influence economic matters unilaterally. Thus, chiefdoms tend more toward command economies, which begin to rely on slavery and *corvée* labor.

The hierarchies of the Big Men, tribal chiefs, and the *Tonowi*,[853] are not established purely by brute force, but by cunning control of the land (which ultimately relies on brute force as accepted by the culture) and alliance-making with authorities of other villages. In Austro-Polynesian societies, status is often measured in terms of pigs, which themselves are often sustained or supplemented on sweet potato gardens, especially when young. By controlling more land and indebting people with compulsory gifts or leasing the land out for others to grow pigs, pyramid schemes are developed. Complex pyramid schemes from Southeast Asia and Austro-Polynesia would spread as far as the Mediterranean, when the Austronesian expansion brought seafaring technology to the area. This likely has something to do with the *sarcophagi*, or elaborate coffins, of Egyptian pharaohs having Asiatic features, such as almond-shaped eyes and yellow skin (as may be represented by gold). Minoan society shows many cultural features in common with Austro-Polynesians as well. However, there was already a grade-taking element that could be found among the peoples of the Mediterranean and Mesopotamia, which might, considering the history already extolled, be owed to a certain mutualism practiced and perhaps spread by Nesiotids, perhaps emanating their knowledge from Atlantis and later subsumed into the Mediterranoid race. This is likely the tradition from which the megalithic builders of Neolithic Europe spring. Without this, little true social structure was possible.

Big Man systems of Australoid New Guineans would be reacted against by the development of chiefly systems of redistribution, but those would eventually be replaced by kingship, likely originating in the monopolization of political power by chiefs in maritime Southeast Asia and Polynesia. Similar in some respects to what one might imagine as a cross between the Big Man system and the Kula Ring is the *Mandala* system, primarily of Malaysia. In the Mandala system, which is similar in many respects to a proto-feudal system as well, political obligations arise from out of gift-giving relationships, wherein

[851] In some ways, this voluntary membership in noble houses reflects the systems of Europe, such as the system of the Germanic *Gothi*, or *Godi*, in which a longhouse was constructed for the purposes of holding semi-democratic meetings, and hosting feasts and gift-exchanges, largely as prestations

[852] Haviland, *et al.*, 295

[853] All owing, remember, to the equilibrium of human morphology in terms of sexual dimorphism

superiors give bigger presents than the *bunga mas* (regular tribute paid to the superior in the form of slaves and various goods including representations of trees made from golden foil). Rulers were not associated with control of territory so much as with relationships of feudal dominance over other rulers, who, as in the Kula Ring, would provide assistance in times of war.

The coronation of European monarchs typically involves the passing along of *crown jewels*, usually including a crown, scepter, and an orb, at least, of precious metals and gemstones. Such coronations, involving the Church, may be similar in some respects to a "man marriage" between Church and State, with the crown jewels being similar to the passing of kula. And feudal obligations in Europe were not entirely unlike the practices that are to be found in the Mandala system. Indeed, the Tongan kings (Nesiotids) wear crown jewels as well. Many of the interactions of tribal chieftains seem to be purely symbolic to those who do not know what is happening behind the curtain. What is really occurring is that an alliance is being maintained between leaders in opposition to their people, and that this external source influence is actually responsible for their power. Without it, they could not get beyond the influence of the Big Man to become a chief, a redistributor. Crown jewels are recognized by external mediating forces such as, in the West, the Church.

Civilizations would appear all over North Africa, Europe, Asia, and then in the Americas. Sub-Saharan Africa, the Americas, and Oceania did not develop agricultural civilization on their own, but they did develop complex tribal systems that would come close, such as the advanced horticultural societies of the Maya, Aztec, and Soninke, and proto-maritime networks and fishing societies, such as those of the Austro-Melanesians. Carroll Quigley says,

> Every civilization, indeed every society, begins with a mixture of two or more cultures. Such mixture of cultures is very common; in fact, it occurs at the boundaries of all cultures to some extent. But such casual cultural mixture is of little significance unless there comes into existence in the zone of mixture a new culture, arising from the mixture but different from the constituent parts. The process is a little like the way in which a mixture of chemicals sometimes produces a new compound different from the mixing chemicals.[854]

Quigley says, "on the borders of societies there is a considerable mutual interpretation of social customs, and there arise, accordingly, alternative ways of satisfying human needs."[855] Ultimately, all social evolution is founded in mutualism, hybridization, and convergence. Civilizations— not to be confused with villages or settlements, which had tended to be "Basal Eurasian" or Alpinid, and Americanoid— were, in North Africa and Eurasia, primarily but not exclusively composed of and led by members of the Mediterranoid race. This race would eventually span the majority of Europe, North Africa, Arabia, and West Asia, but especially along the coast, migrating into Great Britain and Scandinavia, before being partially split by the Alpinid migrations. Civilizations are typically defined by agriculture, itself properly-defined by the use of the plow, although some highly advanced horticultural societies might also be considered civilizations, especially those based on the production of grains, such as rice in East Asia and corn in the Americas. The introduction of advanced horticulture and agriculture, as well as animal husbandry, metallurgy, pottery, and textiles, would help to raise fishing societies to maritime societies, which are characterized by a high dependence on commercial interaction with the outside world for their subsistence. Michael Cheilik, in *Ancient History*, says, of the societies of Mesopotamia, that

[854] Quigley, 146
[855] Quigley, 147

> at first there was very little class distinction among the citizens. To be sure, there was a variety of economic functions among the inhabitants, but there is little indication of aristocracy or monarchy before 2800 B.C. It seems to some scholars that all citizens met in an assembly to select a leader. Slavery began at a very early period, as it occurred to conquerors that killing one's adversaries was wasteful. Why not take them alive and use their labor? But the number of slaves was quite small.[856]

In the Mediterranean, various Aegean or proto-Greek and proto-Roman[857] peoples would show themselves, such as the Cyclads, Minoans, and Etruscans. The early maritime peoples, such as the Minoans and Etruscans, spoke proto-Eurasiatic and perhaps also proto-Afroasiatic languages, sometimes labeled together as *Tyresian*, which would later diverge. Ancient Egyptian and proto-Semitic-speaking civilizations were becoming especially prominent in Northeast Africa and Canaan, maturing in the form of the Egyptians, Phoenicians, and Israelites. Egypt had seen a large number of different inhabitants, such as the Badari and Naqada (a Painted Pottery People). The Canaanites had come largely from the Ghassulian people, and had some cultural similarities to the Cyclads. The Ghassulian subculture called *Beersheba* lived underground and lived near Jericho the city whose walls collapsed. Among the Canaanite peoples would be included not just the Israelites, but also the Phoenicians, together called the *Hebrews*.

Settlements in West and East Asia, Turanian and Dravidian, Semitic, Indo-Aryan, and Sino-Tibetan would continue to develop and to compete with one another, warring, conquering each other, and developing into vast empires. These eventually included civilizations and empires such as the Indus Valley, Akkadian, Hittite, Assyrian and neo-Assyrian, and many others, reaching out to China— which had various sources, such as the Yellow River, Yangtze, Liao, etc.— and the rest of East Asia (including the Mon River civilization in Thailand, Irradaway River in Burma, Mekong River in Cambodia, Red River in Vietnam, etc.). Turan, or Central Asia, was generally occupied by proto-Nordid Pontids and Afghanids and Lappoid or Turanid nomadic herders at this time, and is notable for its use of horses and chariots. It does produce some cultural complexes or civilizations, such as the Aryan and Turanid Oxus cultural civilization,[858] to the North of which were the proto-Scythian Sintashta and Andronovo cultures, among others.

In the Americas, neither agriculture or bronze-production occurred during the rest of the world's Bronze Age and agricultural period, excepting very sparing bronze production. Instead, advanced copper and stone tools were used and advanced horticulture continued, in North America with the production of the *Three Sisters*: beans, corn, and squash; in the South American tropics, fruits such as bananas and papayas were cultivated. The Toltec, Olmec, Mayan, Puebloans (starting with people such as the Anasazi and on to the Hopi, Zuni, Acoma, and the rest), Mississipian, Adena, Hopewell, and other peoples of various Americanoid phenotypes also established strong cultural centers and even, arguably, civilizations, though *civilization* is typically otherwise formally marked by agriculture, in which case the Native Americans had among them uncivilized empires. Peoples such as the Aztecs engaged in *ritual warfare*, or ongoing wars of extermination, against their neighbors. These Flower Wars, which were scheduled and followed strict rules requiring each side to use the same number of soldiers and to only use weapons such as the *machuahuitl*, a wooden club with rows of obsidian blades along its edges, with attempts not to kill the enemy but to collect them for human sacrifice. They were essentially war games. The Yanomami people of the Amazon have a graduated system of escalation of war, going from chest-pounding competitions, to side-slapping, to club fights, and then throwing

[856] Cheilik, 14
[857] Romans, or Latins, came from the Alban Hills of Italy, a volcanic hotspot; notice the similarity to *albino*
[858] Also called *BMAC* or the *Bactria-Margiana Archaeological Complex*

spears, culminating in massacres and abductions of the women. These practices are similar to those of Plains Indians and some New Guineans, who often focus on insults, infliction of minor wounds, and the slaying of key figures of opposition rather than all-out killing one another. Anthropologists have suggested that these sorts of activities might serve as a sort of pressure release valve to keep down the tensions of a society. These wars apparently began due to the need for more human sacrifices to appease the gods. This was typically connected to Sun worship. The Aztecs would extract the heart of a living man during a sacrifice, believing it to be a piece of the Sun's energy, a sort of Sun within the human individual. Human sacrifices in public, when they involved citizens, were done to infringe natural law in public without recompense, so as to establish precedent under customary law. They became quite widespread after the Neolithic, exoterically as a fertility offering, in hopes of bringing the Sun back as it was before the Younger Dryas, after which people had to take to subsistence farming, and esoterically as a means of establishing stately influence. Ritualistic cannibalism was also practiced by many human-sacrificing societies. Another means of collecting sacrifices was through the *Mesoamerican Ballgame*, a game played by South American Indians, sometimes resulting in the severing of the heads of the losers, or at least of their captain. After sacrifices, bodies would often be thrown down the steps of the Mesoamerican pyramids, where onlookers would collect and drink blood, the bodies ultimately claimed by the warrior's family responsible for the capture, to be ceremonially eaten. South and Central American peoples such as the Aztecs and Mayans had a royalty system with courts which was not too much different from those of Eurasia and the Pacific Islands. Native Americas such as the Aztecs, Hopi, and Navajo have myths telling of a number of previous worlds that had been destroyed by prior cataclysms and bringing about evolutionary changes. Oftentimes, according to these myths, humans evolved convergently from out of completely different species, such as their totem animals. Oftentimes the myths describe the survival of those who are morally pure or just, or strong and perseverant, and the vanquishing of those who are not.

Many changes to culture occurred with the competition of societies, among them the selection of languages from the various expansions.[859] The conquering people usually demand the use of their language from their subjects, but as time went on became more skilled in adapting to local cultures so as to be perceived as relatives or cultural allies, even native inhabitants. Today, Indo-European, Semitic, and Sino-Tibetan languages are prominent among the ruling classes, an indicator ethnic origins.

The *Bronze Age Collapse* refers to a sudden collapse of many Bronze Age civilizations, often said to be set on by a group called *the Sea Peoples*, said to have brought about the Greek Dark Ages. Speaking in regard to this, Carrol Quigley associates the peoples of the "Southern Flatlands" especially with the Semitic languages, and those of the "Northern Flatlands" with the Indo-European, saying,

> While the Semitic peoples were emerging from the Arabian desert [...] even greater activities were being performed by the Indo-European peoples who were emerging from the drying Northern Flatlands. These peoples pushed out from the Flatlands in two waves, of which the earlier are called the Bronze Age invaders, while the others, 800 years or so later, are known as the Iron Age invaders [...] a third wave, after A.D. 200, contained a considerable numer of other Indo-European speakers, notably the Germans, but the original impetus came from the pressure of Ural-Altaic speakers [...] the earliest were the Huns.[860]

[859] As from the Kurgan expansion or Aryan invasion, the Austronesian expansion, Bantu expansion, and the expansion of Chinese and Tibetan languages
[860] Quigley, 197

These two invasions, of the Bronze Age and of the Iron Age, are essentially the invasions of the Yamnayan-derived and related peoples and those of the later Scythian cultural complex. The Indo-European Bronze Age invaders, suggests Quigley, had been responsible for the displacement of the Hyksos, who would invade Egypt as a result.

Race and Caste

As with ecological communities, which are characterized by a trophic pyramid, or food chain, and with succession, human political communities are also characterized by these. The layers of the political-economic trophic pyramid are known as *castes* or *classes*, generally depending on the level of the society's development and the roles that those societies have for their populations. A *caste* is a social role that one is born into from birth, often associated with an ethnicity and a family trade or profession that one is obligated to continue on with.[861] A *serf*— a medieval peasant who is tied to the land of the lord and must perform agricultural labor—, for instance, is an example of someone who exists in a caste role. The lord, too, is in a caste role. A *class*, however, is different from a caste, because class is a little less rigid. One can, for instance, choose one's occupation and one's residency. However, class systems are similar to caste systems because they still involve largely-inherited social functions: while one may be able to choose their place and type of work and residency (unlike in the caste system), one nonetheless may be stuck in a particular income bracket that prevents them from being more than employees, tenants, or debtors to others. So, one may choose their work and their home, but may not have the freedom to own and control them, instead being under the control of an employer and landlord. *Class* is the difference between the tenant and the landlord, between the employee and the employer, and between the debtor and the lender, as well as between the governed and the governing. The existence of caste or class in a society is called *stratification*. A society is stratified when it has a caste or class system. Class means that the upper strata is inpenetrable by the lower, no matter the diligence of the individuals involved, with the exception of having subjective favor bestowed from above, a hand up.

A pioneering polity will see on the bottom of that pyramid the slaves, and on the top of the pyramid the chiefs, priests, or kings, with everyone else in between. These slaves might come from Stone Age band societies that have been conquered by a Copper Age clan, or Copper Age clan societies that have been conquered by a Bronze Age tribe, etc. In today's society, we find that there are employees on the bottom, bankers at the top, and managers and businessmen in the middle. The bottom, the employees, are the primary consumers, in that they are the lowest order of consumers,[862] actually serving the role of production for the tertiary predators at the top, the bankers. The bankers, and by extension the government, feed on all, the primary, secondary, and etc. consumers through the extraction of taxes, inflation or deflation, and interest, as tertiary predators. Below them, the landlords, who must pay taxes and interest, extract rent from everyone else (employers, employees, customers). Below them, the bosses or employers extract profit from their employees and their customers. That profit affords the rent they must pay, which affords the interest and taxes the landlord must pay, which affords the conspicuous consumption and the political control of the bankers. Just as with the ecological trophic pyramid, the political pyramid trickles upward. The unemployed are left, like the fungi, to exist as decomposers, or themselves to decompose. Sometimes, like predatory fungi, they resort to parasitism, or crime, in order to get by. Indeed, poverty is the major source of "blue collar" crimes, crimes that are

[861] A simple caste system may be a distinction between priest, warrior, and artisan, for example

[862] Not because they consume without producing. In economic, rather than ecological, terms, the employees are the producers, while the bankers, landlords, and most employers are the consumers (who take without producing)

not committed by the ruling class or their favorite henchmen, and especially of economic crimes, but certainly not limited to them.

Caste and class systems, which were especially spread by a people called the *Aryans*, are systems by which particular treatments toward differing ethnic groups are established. While a system of domination, they may have originated as a means of tolerance toward those who were ethnically less advanced. Consider, for instance, the treatment of humans toward their animals, particularly their beloved pets, such as cats and dogs. Humans do not expect the same behavior from these animals, including the same morality, because such moral behavior requires higher orders of thinking of which these beloved animals are incapable. They love them nonetheless. So, instead of holding them to human standards, they are given a pass for their accidents and misdeeds, but are not given the same rights or privileges enjoyed by humans. This arrangement is as much about love as it is about domination, but ultimately comes down to differences in capacities. Similarly, and though the difference is not as vast as between animals and humans, nor necessarily as loving, conquering peoples, who had established caste systems, sorted out particular treatments toward different ethnic groups according to their perceived strengths and weaknesses relative to one another. As with animals, this did also involve control, and with control comes abuse of powers, but the justification of the original control was ultimately sourced in a desire to keep the peace through tolerance of particular, persistent, and arrogant shortcomings. As it was, the various ethnic groups were resistant to Aryanization, but could not muster the social power to defend themselves from it, Aryanization, coming out, so far, as the victor in sociocultural and intersocietal selection. Rather than adopting aspects of the conqueror's superior culture voluntarily, conquered groups would assert their own approaches, or demand particular treatment based on their established customs, with their own particular justifications based on native sentiments, but without the material and intellectual advantages or social support that the Aryans could claim, ultimately becoming subdued by them and, ultimately also, their own resentment.[863] As Aryans could not expect Aryan morality from those resistants whom they had conquered, they established caste systems so as to provide for the lesser, more particular behaviors and practices demanded by the people they conquered, a sort of freedom of ignorance offset by differences in rights and duties.[864] Demanding particular treatments on the grounds that one refuses to develop to the capacity of one's natural superiors, after all, works so as to make universal treatment by those superiors difficult. If I excuse my behavior on the grounds that I am unintelligent or set in my ways, for instance, others will begin to expect less from me for both of our sakes. This not necessarily about domination, though it does adjust the equilibrium between us.

In recent times— geologically speaking—, white people typically compose the upper racial strata, while black people compose the lower racial strata.[865] This arrangement is especially the case during the cooler part of the Cosmic Year, and perhaps also in periods of cooling induced by planetary events, such as volcanic eruptions and impacts from asteral bodies. The reason for this is that white people gain an advantage in the cold, while black people gain an advantage in the heat.[866] However, it is not always the case that a "lower" racial stratum will be composed of black people, or that an "upper" stratum will be composed of whites. In Northern Europe, for instance, the lower stratum tends to be composed of white

[863] This is not to suggest that resistance to conquerors is never called for, but that such resistance must be based upon a winning strategy supported by an actually-existing sociocultural superiority

[864] This is likely the essential nature of a statism, ignorance offset by differences in rights and duties

[865] This is not a partisan statement. Both the political Left and Right agree that the upper strata is white, but disagree on the causation. Leftists believe it is due to oppression while Rightists believe it is due to racial superiority. But both will acknowledge that the upper strata has historically been composed of white people.

[866] However, periods of black advantage may amount to periods of general equality rather than domination, whereas periods of white advantage may typically involve some dominance

people, such as Alpinids, some Mediterranoids, and even some Nordids; whereas in Africa black people have enslaved one another for a long time, as with Congoid and Capoid people enslaving one another, Congoids enslaving Pygymies, or etc. For example, the Anglo-Saxons had conquered the Britons before themselves being conquered by the Normans; while the Kingdom of Kongo was founded on slavery of the Mwene Kabunga by their conqueror, Lukeni lua Nimi. Further, black Africans had long been enslaved by black West and South Asians (Arabians or Semites, Indians or Elamo-Dravidians, etc.).

Interestingly, when races overlap into substrata and superstrata, there may be times when a resurgence of a substrate comes through. For instance, Carleton Coon says that

> One may find a Spaniard who is typically Nordic in the midst of a population of Mediterraneans, including his own brothers. In a sense the situation is genetically comparable to finding a man of blood group B whose father was A.[867]

There may be cases of this occurring in the extreme, as well, such that archaic races may appear now and again, or elements thereof. Even among known and existing humans there are what seem to be relict appearances of extinct races, as may have been the case with "wolf" or "monkey people" such as Julia Pastrana, the Native Mexican woman whose face and body were covered in hair. Some of her traits appear *Australoid*, like that of an aboriginal Australian, including a large nose, brow ridges, recessed chin, and prognathism, though she also apparently had two rows of teeth, and had characteristics of *Homo erectus*. This is interesting, and may speak of hybridization between two different kinds of primates, which are often identified by their teeth patterns, which often do not match. The traits' reappearance, if she had not been a direct heir of them, may have been an example of *atavism*, the appearance of traits thought to have been lost. Alexander B. Mott, a surgeon, said that she had resulted from the mating of a human with an Orangutan, though others considered her to merely be a deformed Native American. Unfortunately, Pastrana lived the life of a performer and her body was taxidermied and exhibited.[868] Other cases exist outside of the Americas for this sort of thing as well, such as Percilla Lauther, the "Monkey Girl" of Puerto Rico, Fedor Jeftichew, "Jo-Jo the Dog-Faced Boy," from Russia and Stephan Bibrowski, "the Lion-Faced Man," from Poland, Alice Elizabeth Doherty of Minneapolis, and Krao Farini from Laos, known also for her extra vertebrae, cheek pouches, superflexibility, and missing cartilage as well, with photographs showing her as a young child hanging ape-like from her keeper, William Leonard Hunt. These "freaks," as they have been called, and more, have been diagnosed with *Hypertrichosis*, which is understood to result from a number of causes, including mutations and genetic inheritance. Also interesting is the existence of "pinhead" people. These individuals have microcephaly, causing a short head. "Schlitzie" the Jewish sideshow freak, Maximo and Bartola the "Aztec Children," "Pip and Flip the Pinhead Sisters," and "Zip the Pinhead" are all examples of this. Some of their features are common to Neanderthal or *Homo erectus*. This is said to be caused by a a protein-coding gene called *microcephalin*. Some have considered that the gene may be derived from Neanderthal backcrossing or other extinct humans. Indeed, Dean Falk, et al., in "Brain Shape in Human Microcephalics and *Homo Floresiensis*," have said that

> Our findings are consistent with the hypothesis that genes associated with primary microcephaly may have had a role in primate brain evolution and, more specifically, that some brain dimensions in primary microcephalics resemble those of early hominins.[869]

---

[867] Coon[1], 19

[868] Her husband and basically owner apparently found a woman with similar characteristics to marry after her death

[869] Falk

Another oddity that occurs now and again is the presence of *proboscis*, or facial protrusions, of some sort another, often considered to result from birth defects though appearing strangely consistent in some respects. It is possible to consider orthogenetic causes for this, perhaps relating to a unique path of *ontogenetic* (life course of stages) *recapitulation* (repetition of those stages). An extreme condition associated with this tendency is called *cyclopia*, and results in the presence of a single, or sometimes semi-differentiated (or weakly separated) eye or eyes, a missing nose, and a proboscis above the eye. It is related to the much more mild *cleft lip* or *palate*, a split in one's lip or top of the mouth. *Cyclopia* is also found among animals, including among pigs. It may be able to be induced in natal development by the consumption of plants such as hellebore by pregnant mothers. This may have relation to Eugene McCarthy's stabilization theory, particularly his suggestion that humans may be hybridized from pigs, as his video examples of possible human-pig hybrids also have probosci. While the condition is almost always fatal in humans and in pigs, this may relate to a lost stability that may have existed in the past. Alternately, it could simply represent a morbidity that serves as a reminder that absurdities cannot last. Rather than than a different orthogenesis, the condition may represent an arrested development. Whatever the case, Cyclops have made their appearance into many myths or legends of the past, such that it is impossible not to leave the possibility open, even if not to embrace it as a working hypothesis. However, *Cyclops* is etymologically "round eyes," and may simply refer to Indo-Eurafricanoid eyes.

Perhaps gigantism, as was experienced by Eddie Carmel the "Jewish Giant," Robert Wadlow in the United States, Anna Swan in Canada, Andre the Giant from France, or "Giant Baba" from Japan, might also be a relict condition, perhaps showing also in the "Giant of Castelnau" bone fragments found in a Copper Age kurgan by Georges Vacher de Lapouge. Human giants suffer from their gigantism, because they grow too quickly to remain stable, considered to have a growth defect. Neonatal patterns of development tend to follow the evolutionary morphological blueprint inherited in the development of the species, such that human fetuses have tails similarly to the creatures we developed from. This considered, the problem of a human woman bearing a Sasquatch baby is possibly a non-issue if the father of Sasquatch, an even larger creature, had developed from New World Monkeys, having experienced a "growth spurt" in its morphological development later on. This could potentially have led to offspring being smaller at birth, allowing for a *Homo sapiens* woman to have birthed a child that would grow quickly later on, as is the case with people inflicted with gigantism who are said to grow too quickly to remain healthy.

Bronze Age Economy

Credit money, in the form of various methods of accounting— such as single and split tally sticks, notched stones or bones, *bulla* or clay tablets, clay tokens and metal coins—, came around early, but didn't become well-established as the trade media we know it to be today, until well into the agrarian age, especially the Bronze Age.[870] Perhaps credit and rank share a common ancestry. Before coins, which could be taken and exchanged, tallies had been kept on accounting sticks or clay tablets— and in many cases by a third party, such as a government—, or clay tokens would be issued, in the same manner that metal coins were, as a demand on grains stockpiled, as in Egyptian, Babylonian, Indian, and Chinese societies. Nolan and Lenski suggest that

> Archaeologists have found a variety of clay tokens in horticultural sites from modern Turkey to Iran, but until recently no one could identify their use. Then it was discovered that the markings on many of the tokens were remarkably similar to symbols later used in early forms of writing for such words as "sheep," "wool,"

[870] Perhaps credit and rank share a common ancestry

> "cloth," "bread," "bed," and a variety of numerals. This strongly suggests that the tokens were used to represent those same objects and numbers. Since these tokens were often stored in small clay jars, they were probably records of early business transactions, such as loans.[871]

Quite similarly, Clifford D. Conner, in *A People's History of Science: Miners, Midwives, and Low Mechanics*, writes that

> Schmandt-Besserat demonstrated that preliterate people, to keep track of the goods they produced and exchanged, created a system of accounting using clay tokens as symbolic representations of their products. Over many thousands of years, the symbols evolved through several stages of abstraction until they became wedge-shaped signs on clay tablets, recognizable as writing.[872]

Writing, as it were— particularly, cuneiform— had grown from out of accounting. The Phoenicians, though, were responsible for the shift to *phonetic* alphabets, alphabets that represent vocal utterances— specifically phonemes—, such as the one you are reading right now, the English alphabet. This was an important shift away from the symbols of earlier methods of writing such as hieroglyphics, cuneiform, Linear B, or etc., which tended to be, at most, syllabic with only some aspects— such as in late hieroglyphics— of phonemes (units of sound). The West would have to wait some while, however, for Indo-Arabic numerals to replace the chaotic numeric systems of classical Mediterranean civilization.

Lending breeding animals or seeds would come with an interest in form of their production of more animals or seeds. Since a single seed or animal reproduces itself many times over, both lender and debtor gain from sharing the product in such a transaction. Cattle had long been a prevalent measure of wealth, and wealth was important because it was a measure of social status.[873] That the word *capital* is derived from *cattle*, and that *stock* refers to "livestock," demonstrates the importance of cattle for the history of our economy. Cattle were among the earliest demonstrable commodity money, and perhaps the earliest basis of coin, as demonstrated by archaeological evidence of early coins shaped like cattle, and coins on which are found cattle heads. Horses were sometimes used as a basis of coin, as well, and Semitic society would tend to use coins backed by grains. That *shekels* represented a certain weight in barley, and was also a term used to describe the barley itself, is a testament to this. Somehow, people started to think of coins as themselves having intrinsic value, forgetting their symbolic origins in livestock and grains. This may be related to the perception of money as a source of status, something the Sami clearly expressed with their decorative use of it, and likely comes from laws recognizing certain coins as money, giving the impression that the coins themselves have value, rather than being a unit of account.[874]

Mesopotamian and Greek societies represent some of the earliest users of coin and earliest banking societies. The basis of tokens and coins was usually some form of agricultural production, such as grains or livestock. In a certain respect, tokens represent a move away from commodity money driven by prestige toward money representing necessities of value to the common person. This would greatly enhance the velocity of money, as money would become more valuable even to those who had given up

---

[871] Nolan and Lenski, 111

[872] Conner[1], 68

[873] Social status is important to people largely for sexual and social reasons

[874] This became such a widespread misunderstanding, that the countries of Europe would themselves come to believe that the value behind their currency was in the metals themselves, rather than in their use of a unit of account. This regressive treatment of stamped metals as bearing intrinsic value, and confusion of their use as a unit of account for commodity money, was responsible for much of the economic inflation that would inflict pains on Europe, in particular when precious metals from the New World would change the supply of gold and silver.

on the competition over easily-monopolizable prestige items. According to Buckminster Fuller, at one time,

> all money was cattle, lambs, goats, or pigs—*live money* that was real life-support wealth, wealth you could actually eat. Steers were by far the biggest food animal, and so they were the highest denomination of money. The Phoenicians carried their cattle with them for trading, but these big creatures proved to be very cumbersome on long voyages.[875]

He says,

> Graduating from carrying cattle along for trading [...] the Phoenicians invented metal money, which they first formed into iron half-rings that looked like a pair of bull's horns. (Many today mistake them for bracelets.) Soon the traders found that those in previously unvisited foreign countries had no memory of the cattle-on-board trading days and didn't recognize the miniature iron bull horn.[876]

He says further that the transition to the use of metals instead of live animals had led to the formation of pirates, who would board the ships and take their gold. On its own, gold had become a status symbol, at least since the time of the Varna culture, and thereby an important item of conspicuous consumption.

Certain commodities, such as cattle or precious metals, would be given governmental privilege as legal tender, and sovereigns would make income from *seigniorage*, payments made for coinage. Coinage took off in the Bronze Age, a time when bronze made tasks easier, being stampable. Governments would eventually come to coin money, pay it to its soldiers in war, and demand it back from commoners in taxes. Courts would come to enforce certain items, such as metals, as legal tender, because these had become customary measures of status and functional mediums of exchange through gift exchanges and barter. Metal coins were not really traded for their intrinsic value,[877] however, but represented livestock or grains stored in silos and were sturdier and more impressive than clay. Anatolian traders may have been the first to use metal coins. Herodotus, in *The Histories*, suggests that they were created by the King of Lydia. He says,

> Now the Lydians have very nearly the same customs as the Hellenes, with the exception that [...] they were the first of men, so far as we know, who struck and used coin of gold or silver; and also they were the first retail-traders.

Plants and animals produce a natural "increase," while other forms of so-called "capital" (cattle) do not. While one can lend a goat that is known for having twins, and demand the goat returned with a kid, without much harm being done to the debtor, who may also have a kid; one cannot lend a coin and expect that the recipient return with two coins in the same fashion. But the custom had been established to provide an increase upon the repayment of a loan. It may have been natural to have some confusion about the conflict between custom and reality. But the pursuit of interest from non-living capital was how a potentially justifiable practice became something quite problematic. Capital really did reproduce at its origins (livestock) but did not when it came to non-living property.[878] The result was what today we refer to as *debt-slavery*. Such a situation creates debt-slaves, because when a monetary loan with interest is given, the recipient of the loan, as soon as they receive it, only receives the amount

[875] Fuller, 73
[876] Fuller, 74
[877] Except, perhaps, to people such as the Sami, also known for flaunting their money purses and wealth in reindeer, who would wear coins as decoration
[878] While existing before, this non-living capital became dominant during the industrial era

necessary to repay the principal, and not the interest.[879] And in a system in which money is loaned into existence, about the only way to repay it with interest is to engage in cutthroat tactics to get it from someone else who got their loan under similar conditions. Like a game of musical chairs, Thomas Greco, in *Money: Understanding and Creating Alternatives to Legal Tender*, points out that not everyone can win in a system of interest-bearing currency:

> The principal amount is created to pay at the time the loan is made, but the money to pay the interest due in subsequent periods has not yet been created. Thus debtors, as a group, are in an impossible situation of always owing more money than there is in existence. They are forced to compete with one another for scarce money, in a futile attempt to avoid defaulting on their debts. Like the game of musicial chairs, the system requires that some must eventually fail. Those borrowers who default on their loans, of course, end up losing their collateral.[880]

What Thomas Greco is demonstrating here, knowingly or not, is that usury is a form of cleromancy. Who gets to pay back their loan is a roll of the dice, as it were, and a matter of who gets to live and who has to die, as decided by God and interpreted by the priesthood, which had, as in all theocratic societies—wherein priests tended to develop silos for community deposit of grains, the first known form of tithes and taxes—, developed into the central bankers. This was natural, as usury was something that had been practiced especially by the Canaanite peoples, such as the Phoenicians, the Jews, and perhaps the other Israelites as well, who had developed the practice of cleromancy to determine the will of God, but who had also been the developers of what would have amounted to a sort of primitive capitalism, straddled somewhere between that of the Kapauku and the capitalism of today. Buckminster Fuller suggests something similar to Greco, saying that during a Phoenician voyage, in which cattle had been deposited with a banker as collateral, they

> had calves, "kind" (German for "child"), and this is where the idea of interest originated, which was payable "in kind"—the cattle that were born while the collateral was to be held by the banker were to belong to the banker.
>
> When the Phoenicians shifted their strategy from carrying cattle to carrying metal money, the metal money didn't have little money—"kind"—but the idea of interest persisted. This meant that the interest was deduced from the original money value, and this of course depreciated the capital equity value of the borrower.[881]

The radical Right-wing bunch who call themselves "*Freemen on the Land*" or "*Sovereign Citizens*" also tend to trace much legal and financial jargon and origin to the Phoenicians, suggesting that *banker* refers to the fact that one banks one's maritime vessel (of the Phoenician or Viking sort) on a beach or sand bank. Many of these individuals suggest that the entire Phoenician slave operation is essentially still in effect, and that one's birth certificate is a corporate straw-man, *birth* actually referring to *berth*, a port used for *mooring* or tying down maritime vessels when they are not out to sea. At a berth such a vessel might be unloaded of its cargo, the suggestion of these folks being that a birth certificate is something like the certificate of delivery of particular goods from the berth. The birth certificate, they suggest, is evidence of one's being in fact owned by the bankers, similar to livestock. It is certainly true

[879] If a $100 loan is given, but $10 are required on top of the $100 as interest, making the debt $110, there is not enough money given in the loan to repay the interest. In an economy where this is widespread practice, debt-slaves are created. This is independent of the diligence of the participants. Even if all participants are equally diligent, there will be debt-slaves.
[880] Greco, 8
[881] Fuller, 76

that the Phoenicians had engaged in slave-trading, which had carried on also with the Venetians, who also took up usury.

Usury was not the only problem during the Bronze Age. Privatization of the land, which had its prominent beginnings in the Copper Age under the influence of horticulture and people protecting their gardens from both animal and human (especially outsider) intruders, and especially after the establishment of hierarchies by one clan or tribe over another, had continued to proliferate and become normalized under the Bronze Age. Distinct from *personal property* in, or *possession* of, land, private property in land is characterized by such things as absentee control and extraction of economic rent, such as when one leases one's land to another, speculates on it, or uses a superior parcel to public disadvantage. Landlords, early on, were generally statesmen and priests, often claiming hold to the land on the basis that it was granted to them by way of the gods of their ancestors or through the Right of Conquest, and typically justifying their private control on the grounds that they served as trustees on behalf of the tribe or nation. Those who had no claim to the land themselves included especially slaves and, as it came into practice—especially becoming normalized during the Iron Age—, serfs. However, even in such primitive societies as the Kapauku of New Guinea landlordism and the leasing of land exists, suggesting that these sorts of arrangements have existed for a very long time, but it was perhaps enshrined in law most prominently, in the West, by way of the Roman Empire. Henry George says, in *Progress and Poverty*, that

> Wherever we can trace the early history of society — in Europe, Asia, Africa, America, and Polynesia — land was once considered common property. All members of the community had equal rights to the use and enjoyment of the land of the community.
>
> This recognition of the common right to land did not prevent the full recognition of the exclusive right to the products of labor. Nor was it abandoned when the development of agriculture imposed the necessity of recognizing exclusive possession of land — to secure the results of labor expended in cultivating it.
>
> How, then, has private ownership of land become so widespread? Why was the original idea of equal rights supplanted by the idea of exclusive and unequal rights? The causes are the same ones that led to the establishment of privileged classes. We can summarize them briefly: (1) The concentration of power in the hands of chieftains and the military. (2) Conquest that reduces the conquered to slavery and divides their lands, with a disproportionate share going to the chiefs. (3) The differentiation and influence of a priestly class. (4) The differentiation and influence of a class of professional lawyers.
>
> The interests of priests and lawyers were served by the substitution of exclusive property in place of common land. In Europe lawyers have been especially effective in destroying all vestiges of the ancient tenure by substituting Roman law — exclusive ownership.[882]

Barbarian societies like the Celts and Germanics dealt with property as a matter of customary or common law, and related rights to one's caste. Germanic nobles, for instance, and sometimes even commoners, might establish a private or allodial claim over the land as homesteaders. The common law, under which allodial claim was acknowledged, and according to which common lands were administered, was the law of the conquerors, whereas the peasants had operated generally by way of customary law, often being themselves herding, fishing, or horticultural people living a Stone Age or, at most, Copper Age lifestyle. Perhaps important craftsmen, artisans, and wise men might be spared in

[882] George

war and assimilated into the new Bronze Age society, perhaps even being allowed to advance in the guilds, and thereby from copper to bronze production. Brian Madigan, in "Allodial Title as explained by Thomas Jefferson," tells us that

> Property which was occupied and held by force against others was held in "allodium." Basically, that means "without any restriction, of any kind or nature whatsoever." People would come across unoccupied, vacant land and would simply make it theirs. There was no one around, no one to say they couldn't have it, no one to grant permission, no one to sign a deed. In this regard, "might was right." If you had the property and could defend it against others, then it was yours in "allodium." Since there was no place to register your title, it was simply acknowledged that you held allodial title. That simply meant that you had no deed.
>
> To a certain extent, the concept of "allodial title" was just a legal fiction. It doesn't really exist in the legal system. It is simply a method of comparing it to other properties and helping to understand the differences between it and "fee simple."
>
> [...]
>
> So, to have allodial title is simply to own your land by occupancy.
>
> Actually, the only way that you can hold title this way [today] is if you are a country. There are no deeds. Other countries simply accept that they will not claim your land, since you are likely to defend it.[883]

Allodial lands were also called *folklands* while those lands that had deeds were called *booklands*. Land of any sort could become "loanland." Folkland belonged to a single person, but as part of a family or kinship group, and ultimately as part of an ethnic or tribal group sworn to hold the land against invaders or uprisings by serfs. Allodial claim was held by any free man, sometimes but not always favored older brothers in inheritance, and would especially become the strength of nobles, who, though feudalism was absent, laid claim to native peoples as slaves or serfs. Allodial claim was established as a caste of conquerors, with conquered people being forced into slavery or serfdom, often becoming the wives of freemen and establishing people of mixed race and caste, sometimes considered free but not always. Spencer Heath, in *Citadel, Market, and Altar*, held that what was *owned* was that which was *owed*. He said,

> In its Anglo-Saxon meaning, now only dimly realized, to own was to owe. Ownership was inclusive of others, not exclusive. What was owned, chiefly land, was held in trust, as it were.[884]

This trusteeship was to the benefit of the community, the other freemen and nobles, whose allodial title was tied up with those of others in the need to protect from foreign invaders. Allodial title was justified by one's being also a kinsman, and so a representative of the nation, which is, in allodial fashion, co-holder of the land by way of obligation to defend tribal territory. Regarding the Celtic approach to land, Martin J. Dougherty, in *Celts: The History and Legacy of one of the Oldest Cultures in Europe*, says that

> Land was the property of the tribe as a whole, although it could be owned by individuals, and the same custom applied to cattle. This apparent contradiction meant that an individual could count land among his property but it could not be

[883] Madigan
[884] Heath

> sold or traded. In this way an individual could not deprive the tribe of his land if he were convinced or coerced into selling it, and while he could sell or trade his cattle he required the permission of the tribe. This concept of common ownership died out in much of Europe as other social systems overlaid Celtic traditions, although it did persist in Highland Scotland for many generations. [885]

Where it existed, and it did so before the development of feudalism, allodial title served to privilege a private owner, similar to a freehold under capitalism but even more absolute. These barbarian societies would often treat the land and its use in something like a proto-feudal fashion, with an imposed caste system of some sort or another, and with associated rights of caste. For the most part, land was held in allodium or in the commons, though under the authority or protection of the chieftain or king. Traditional ownership left much of the land for common use, though allodial authorities taxed users, often by way of corvée, for private benefit.

Commoners were people who were granted right of the use of the commons. Pastures could be visited by any herdsman, shepherd, or goatherd; every commoner maintained the right to *pollard* or *coppice*, that is, to cut trees that will produce straight, easy to cut branches as a result; and various kinds of *field systems*—arrangements for the allocation of agricultural land for use by peasants— were established, often involving rotation of fields and payment of community "taxes," a rent for the right to exclude others from that part of the commons. The commons may vary in size, depending on whose authority they were under, either as the property of a lord or of a parish. Commoners occupied a portion of land that was otherwise in the commons, rented from the authority of the commons, or were somehow associated with the commons, as by being adjacent to the commons, by way of parish association.

Allodial title and traditional use of the commons were maintained Celtic and Germanic clans and tribes, but private ownership and landlordism under the protection of statutory law accompanied the Mesopotamian, Egyptian, and Greek city-states, Roman Republic, and the Greek and Roman empires, and followed the Norman Conquests, and so on. In some cases, a sense of private property was practiced, especially to the favor of chieftains, but it was not until the large states of classical antiquity, such as under Rome, that private property would become a widespread matter of statutory or civil law.

Esoteric and Exoteric Religion

Civilization would be guided by the prophecies of priests and soothsayers. Evolving from shamans, they had come to govern through or guide the decisions of chiefs and kings. The first states and governments were *theocracies*, wherein the religion was the state and the priesthood was the government (or by some other strong arrangement between religion and military might). The first taxes were rents paid as tithes to the religion, typically in the form of grains which were kept in silos and looked after by the priesthood, who took the responsibility upon themselves of distributing it to the people, often in return for clay tokens issued by silo authorities. Priests would become more than simple masters of ceremony, but the intermediaries between the gods and their fellow humans, becoming the guardians of secrets and myths.

It may be that the clan organization, which originally allowed for mutual aid between extended kin, was centered on a semi-priestly "cult of the warrior," which was necessary for clan cohesion. Nolan and Lenski state that "[t]he increase in free time for men [owing to horticulture] often led to increased warfare and the emergence of the cult of the warrior."[886] To become a warrior, and often a *man* more

[885] Dougherty, 48
[886] Nolan and Lenski, 131

generally, one might go through various rites or rituals to acquire a psycho-spiritual oneness with Nature. These practices, often involving *entheogens*, or drugs, were supposed to awaken an understanding that the warrior or "brave" was a part of an interconnected whole, freeing him from the fear of death. This allowed him to bravely[887] go into battle and die. One might typically become a warrior, and so a man in the eyes of the tribe, in his teen years after puberty.

Metaphysics can be very important for people's lives. With a focus largely on ontology— studies of modes of being, the way change occurs— metaphysics can be quite impactful, often supplying people with much needed faith and ambition. The mental and physical well-being that spirituality encourages develops strong, healthy, and united individuals, who, in the past, have formed temples and the first sedentary lifestyles. Cryptic myths, as administered by priests, however, and not only metaphysics, also have a way of binding people together in absence of higher logic. In fact, *religion*, the result of the use of myths by priests, means "to bind." *The Treatise of the Three Imposters*, probably written by John Toland or someone similar, tells us about the origins of religion. It says,

> Before the word *religion* was introduced in the world mankind was only obliged to follow natural laws and to conform to common sense. This instinct alone was the tie by which men were united, and so very simple was this bond of unity, that nothing among them was more rare than dissensions. But what fear created a suspension that there were Gods, and invisible powers, they raised altars to these imaginary beings, so that in putting off the yoke of Nature and Reason, which are the sources of true life, they subjected themselves by vain ceremonies and superstitious worship to frivolous phantoms of the imagination, and that is whence arose this word *religion* which makes so much noise in the world.

Social binding of the religious sort was a necessary precondition to the establishment of large, multi-community societies in absence of Reason and an understanding of Nature. Religion is as much an effect of ignorance as it is its cause, it representing an interplay of the internal and external happenings known by the individual, their inner impulses met be outer "forcing." If the individual is not sufficiently strong in their inner impulses they will falter to the external forcing. Without motivations that extended beyond the limits of the corporeal self, narcissistic self-interest would hinder social cooperation. Religion provided an alternative, and one that allowed clans that utilized it to fill the ecological niche for higher orders of succession. Nolan and Lenski say that the "shift from hunting and gathering" toward "plant cultivation" had "provided societies with the means of establishing an economic surplus," however, they suggest, this was only achievable "if the growth in productivity was not consumed by a corresponding growth in population." So, they say, in order to "translate the potential for a stable surplus into a *reality*," people had to establish "an ideology that would motivate the producers of food to turn over a part of their harvest to an individual in authority who could dispense of it as he saw fit."[888] Of agrarian societies, they reiterate that

> *Technological advance created the possibility of a surplus, but to transform that possibility into a reality required an ideology that motivated farmers to produce more than they needed to stay alive and productive, and persuaded them to turn that surplus over to someone else.* Although this has been accomplished by means of secular and political ideologies, a system of beliefs that defined people's obligations with reference to the supernatural worked best in most societies of the past.[889]

[887] Or foolhardily
[888] Nolan and Lenski, 130
[889] Nolan and Lenski, 139

Religion was, as they well demonstrate, a necessary precondition to a more advanced, more highly complex society. The human race could not have gotten to where we are today without this crucial stage of development. This is just as true as, and is an expression of, the fact that ecological climax communities do not result from skipping the colonizing or pioneering stages of development. The pioneering stage is a necessary step, which both establishes the conditions for the future development of the climax community, and contradicts its own longevity. It appears that the means of convincing people to turn over their surpluses to the silos of the priests involved the transformation of gift, silent exchange, or even commodity money economies toward a proto-feudal system, whereby offerings or tithes were given to the priests, who would give out clay tokens as a receipt for their good deeds, understood to be given to the benefit to the gods. From these grains, allotments would be given during times of famine, and beer and other intoxicants produced, providing value-added products as well as tools of addiction and persuasive capacity. Intoxicants of various kinds, but especially hallucinogens, helped to convince people of the existence of the gods as psycho-ecological forces, a tradition perhaps beginning in Siberia amongst shamans, perhaps carried from the Americas by relatives of the Naacal. Hallucinogens such as ergot can be produced from grains and have often been associated with "dark arts." Shamans of South America are even today highly sought-after for entheogen guidance such as in tobacco and ayahuasca ceremonies. Interestingly enough, the Naacal would become the Maya, and in the Hindu tradition *maya* refers to "illusion," particularly of an existential sort.

According to *Malachi* 3:10, in *The Bible*, there is a challenge from God to tithe and to receive an increase thereby, and even to test God in these gains from tithing. This appears to have some relationship to the "silent exchange" as occurs even today among Bantus and Mbutis, or to the offerings to the gods that I have already compared to the silent exchange. But in *Malachi*, tithes are instead brought to the storehouse. What might the returns consist of? How is the increase gone about? It appears that the priests were conjuring some sort of gain through pooling of resources, and sharing out the gains, in a manner similar to interest on one's bank account. Could this have been pooling to support warfare, with the spoils being shared out? Or perhaps the grain was not kept entirely local, but was used to exchange with distant peoples? Whatever the case may be, it seems to have something to do also with the practice of *jubilee*, whereby all's debts are forgiven and land redistributed or laid fallow as part of the *Schmita* cycle, and may have something to do with tactics used by bank robbers much later in the American frontiers or during prohibition, who would gain local loyalty or popularity by sharing their takings with local people. The debts that were forgiven—freeing the individual from slavery—, and the land that was redistributed, had, by the time of Jubilee of course, already provided much interest and rent to their Hebrew or Jewish lenders and landlords. These gains were not necessarily redistributed. Where might they have gone? As rewards for good behavior? To incentivize *tzedeka*, offerings or tithings to the "Lord," and keeping up with one's other *mitzvahs* and so on?[890] Jubilee is ultimately a divvying of the bounty gained from gentiles— their wages as rents and interest— to Hebrews or Jews collectively, giving them a personal stake in their ethnic identity. This appears to be the workings of a Canaanite or Babylonian gift economy or "Mandala system," with "the Lord" as the Big Man or proto-feudal archon, his returns being derived from external sources, including eventually the efforts of Anglo-Saxon artisans and especially Alpine peasants, with surpluses used as gifts allowing thereby for one-upmanship and loyalty-building similar to the proto-feudal systems of Southeast Asia.

[890] It must be remembered that the Jews and Goths are of close relation, if not overlapping, and that the Germanic Santa Claus would bring gifts on what would become Christmas, but would skip over the little boys and girls who had misbehaved.

Mesopotamian religion, one of the oldest and most foundational to civilized world history, is oftentimes considered polytheistic, and in many ways it was, but a more accurate depiction is one of *henotheism*,[891] wherein deities are sorted into various hierarchies. In Mesopotamia, some of these deities, often considered the most important by their claimants, were patron deities, which represented, or governed over, a particular city. Marduk, for instance, was the God of Babylonia, and Enki was the God of Eridu. The belief in these gods contributed to the success of the particular city-states. For the longest time, city-states held their own deities up high, but saw the deities of other cities, oftentimes, as enemy forces. They didn't disbelieve in one another's deities, necessarily, but neither did they worship them, a condition that is sometimes called *monolatry*[892] or, if polytheistic, *polylatry*. Just as henotheism united people into their many city-states, the rise of monotheism allowed for ideologies to create and maintain nations.[893]

That the various gods in polytheism and monotheism, while often actually humans secretly manipulating natural phenomena, represented aspects or the whole of Nature or existence is a testament to the naturalism of primitive and ancient peoples. Aspects of Nature were personified, as the various pagan deities show and as Sanchuniathon attests; and the Sun, Moon, and stars were also looked to as symbolic representations or manifestations of divine *astrotheological* (and later physiological) principles—principles coming from an understanding of the gods as astral entities—, or which otherwise suggested a divine plan that could be interpreted by Druids[894] and magi through astrology. European paganism, as well as that of the Hittites and others, originally worshipped some form of Mother Earth goddess. *Brahman*, the God of the Hindus, represented the Ground of Being or the Universe. *Ahura Mazda*, the God of Zoroastrianism, represents positive existence, goodness as Being, and *Angra Manyu*, or pure evil, represents non-Being. *Yahweh*, the God of the ancient Hebrews, means "I am,"[895] another affirmation of Being or existence.[896] All of these are notions from primitive "systems thinking," and are mnemonic or illustrative, and stand for concepts relating to what *is*, such that humans may consider how they relate to the higher power that is Nature. Even in today's jurisprudence, an *Act of God* refers to a natural catastrophe.

Consider what Buckminster Fuller said about the rivers flowing from out of the Himalayas in relation to what Carroll Quigley has to tell us about in *The Evolution of Civilizations*. Quigley, who addresses Western Civilization only, places the origins of civilization, as is customary to do today, in the Levant. This might not actually be incorrect, because it does seem that the plow was invented in the area, which has often been seen as the point of demarcation between proto-civilization and civilization-proper. Nonetheless, it appears that the Sumerian priesthood, whom Quigley tells us about, in the Tigris-Euphrates River Valley, who "saw a connection between the advent of the flood and the movements of the sun,"[897] had learned something from the ancient Tibetans. What was is that they learned? Statecraft, or "a social organization capable of accumulating an economic surplus and able to direct its application

[891] Perhaps first identified by Frederichs Schelling and Welcker and popularized by Max Muller
[892] Perhaps first identified as such by Julius Wellhausen
[893] Atenism, Zoroastrianism, and early Judaism, for instance, further united the Egyptians, Persians, and Hebrew people under their nation's singular Gods, which gave them a common national identity
[894] Posidonius described the Druids as philosophers
[895] "Pseudo-Dionysius," who promoted an apophatic theology, and Origen, another neo-Platonist, considered Yahweh to be the neo-Platonic One
[896] *Yahweh* is suspiciously close to *Yowie*, the name for Sasquatch among Australians, understood to be either an ape-like terror similar to Sasquatch or otherwise a spirit entity. Also similar to Hebrew conceptions of God, Sasquatch myths across the world are often associated with name-saying taboos, often suggesting that saying the name will result in one's fate. There may also be a connection to Emperor Yao and the story of the Great Yu stopping the floods during his reign. In China, the ape-man legend is called the *yeren* or the *jue*.
[897] Quigley, 210

to productive projects."[898] Quigley refers to such tools of deception as religion as "*mechanisms of expansion*." He tells us that the Sumerian priesthood, which had established itself as the ruling class of Ancient Sumeria, had learned to predict the dangerous, annual floods of the alluvial river valleys, and

> With this information the observer was able to estimate roughly the day on which the flood would arrive each year. This calculation the discoverers kept secret, for their own profit, using the knowledge to work on the fears and the superstitions of their neighbors, trying to convince others that they possesses magical powers enabling them to foretell the arrival of the flood, or even the power to make it arrive.[899]

These magical powers were the ability of the priesthood— or so it seemed— to mediate affairs between men and gods, the forces of Nature. But that is not what they shared with the people they governed. Instead, they convinced the people of supernatural beings from the sky, what we now know as space aliens, but which they referred to as the *Annunaki*, which included the Trickster god Enki, perhaps of some relation to the Evenki people of Siberia. The Annunaki have been associated with the *Brotherhood of the Snake*, otherwise known as the *Babylonian Brotherhood* or the *Great White Brotherhood*, which was, according to Brian Robert Hyland in "The Brotherhood of the Snake," "a Mystery Religion of Babylon that created religions and secret societies that we now have today."[900] Alexander Light, in "The Brotherhood of the Snake," writes that

> When we look to discover who founded the Brotherhood, Mesopotamian texts point right back to that rebellious "God," Prince Ea (later known as Enki). Ancient Mesopotamian tablets relate that Ea and his father, Anu, possessed profound ethical and spiritual knowledge. This was the same knowledge that was later symbolized as trees in the Biblical Adam and Eve story. [901]

Light attributes the story to the origins of *Homo sapiens* as a "work race" that went awry. He says that

> *The Bible* informs us that the serpent in the Garden of Eden was overcome before it was able to complete its mission and give Adam and Eve the "fruit" from the second "tree." Ea (who was also symbolized as a snake) was banished to Earth and was extensively villainized by his opponents to ensure that he could never again secure a widespread following among human beings.[902]

This is something like a Promethean figure. The brotherhood has also been associated, by Michael Tsarion in *The Irish Origins of Civilization*, with the Hyksos and the Pharaoh Akhenaten.

The belief in space aliens, or gods from the sky, may bear some relation to the Sino-Tibetans and their beliefs surrounding the Pole Star, or North Star, which they represented by the center of a jade disc, and believed to be Heaven, to which they could ascend. Remember, the Australoids may have been making a pilgrimage to the Toba Volcano site, and Atlantis may have been built atop a natural catastrophe itself. Happenings from the sky would have been equally moving. But perhaps space aliens in particular go all the way back to the Sierra Nevadas or further toward South America, perhaps to the ancestors of the Naacal. Mount Shasta, for instance, is the home today of many beliefs surrounding UFO and extraterrestrial activity, paranormal happenings, and so forth. In *A Dweller on Two Planets*, Frederick Spencer Oliver claimed to have passed on from a Tibetan spirit teacher that mystically appeared to him, among other paranormal claims, that survivors from Lemuria lived in a tunnel complex in Mount

[898] Quigley, 211
[899] Quigley, 212
[900] Hyland
[901] Light
[902] Light

Shasta, occasionally to be seen on the surface in white robes. The Great Basin area around Mount Shasta is known by the native peoples as *Hawaii* (*Awahee*).[903] Yosemite Valley in California is similarly called *Ahwahnee* and Southwest Idaho is likewise called *Owyhee*. This likely harkens to a time when the island of Hawaii and the California region were combined. "Good morning" in Japanese is *Ohayo* (Ohio?), referring to the East where the Sun rises. Harvey Spencer Lewis, too, under the pen-name Selvius or Wishar S. Cerve, believed that the people of Mount Shasta were the ancient Lemurians, writing about it in "Lemuria: the lost continent of the Pacific" and "Descendents of Lemuria: A Description of an Ancient Cult in California." He wrote of the Lemurians having lived in an invisible village, which I take to refer more literally to their temporary international assemblies of leaders from other tribes as experienced by outsiders, remembering that the indigenous Yana people of Mount Shasta were known for their leaders having not participated in war but instead meeting with the leaders of other clans to make peace, indicative of secret alliance-building efforts. Such alliance-building might be used for efforts such as those of the Duk-Duk secret society, so that men who went about penalizing trouble-makers, even by way of burning homes and killing them, might not be of any personal relation. Indians of Central and Northern California participated in the Kuksu religion, which involved a secret society of men who met in underground dance halls and danced in costumes in civil ceremonies. But this seems to be related to a more *eso*teric approach. The *exo*teric view is that Yahweh is a being distinct from the Universe, who has authority over it. Could the myth of the Yowie—the name of Sasquatch in Australia— be at the root of exoteric belief in gods such as Yahweh? Could religion be a conspiracy of a Duk-Duk-like secret society, the creation of a mutually-upheld myth? It seems that the Yowie may be entirely the creation of a secret society that has caused a commotion by way of a concerted performance, much like Yahweh. But is there something real at the bottom of it all?[904] Are there unknown humans of some sort living in Mount Shasta and the Himalayas? Do the elites worship them as ancestors?

Similarly to the Sumerians and their Annunaki, it was the Hurrians of the Taurus Mountains, in Turkey, wherefrom the Tigris-Euphrates flow down into the Cradle of Civilization, that were the apparent originators of Western storm gods. It was the god Adad who was said to make the Tigris and Euphrates flood the land, allowing it to become fertile. Taurus Mountains are also the location of Mount Ararat, where Noah, professed in the Ethiopian *Book of Enoch* to have been an albino, is said to have landed his ark. Buckminster Fuller gives us another example of this sort of state-and-priestcraft, but in a different form, when he tells us that

> When the supposedly God-ordained chieftain [...] finds his prestige and popular creedance declining, he can go to the navigator and ask him to produce a miracle. The chieftain does not know of the navigator as such. The chieftain knows naught of navigation. He thinks of the navigator as a magician or miracle-maker. All the chieftain knows is that his miracle-producer goes off to sea sailing his catamaran out of sight on the ocean. The navigator, using his well remembered, unique patternings of the stars and the ocean currents, water temperatures, and major "old-seas" patterns, goes to another far-off island where there exist shells or trees or stones or other items such as have never been and probably never will be found on the home island. The navigator brings this foreign item back to the island king-chietain, who displays it before the people, who spontaneously assume that the chieftain has

[903] This area includes Humboldt County

[904] Graham Joyner believed the Yowie to have been a marsupial. Kangaroos have a strangely human appearance at times. Followers of this logic call their idea the "*marsupial hominid hypothesis*" and consider the possibility of the Yowie having evolved hominid characteristics by way of convergent evolution.

> conjured the strange object into existence with his divine powers—and the chieftain's accreditation as being divinely instituted is restored.[905]

Throughout time, the truths behind Nature and religion have been reserved for esoteric priestly elites, skilled in naturalistic interpretations of myth; while dogmas have been administered to the lay person through exoteric religion and superstition. Church and state, or military might, have long worked together as brain and brawn to control the people, and this longstanding mutualism has been very effective, allowing a minority of the population to control the rest. With the knowledge of the truth, civil society is constructed or statecraft is undergone, but with the Promethean spread of this elite and esoteric knowledge to members of the lower class—that is, with *enlightenment*, or *gnosis*— after the establishment of states comes revolutions. For this reason, it has been kept secret. Peter Kropotkin, in *Mutual Aid: A Factor of Evolution*, suggests that

> the first rudiments of knowledge which appeared at an extremely remote epoch, when they confounded themselves with witchcraft, also became a power in the hands of the individual which could be used against the tribe. They were carefully kept in secrecy, and transmitted to the initiated only, in secret societies of witches, shamans, and priests, which we find among all savages. By the same time, wars and invasions created military authority, as also castes of warriors, whose associations or clubs acquired great powers.[906]

One of the oldest, longest-lasting, and most successful religious traditions is the secretive mystery tradition. The mystery tradition was such an old and widespread phenomenon that the Midiwini of the Ojibwa tribe of American Indians' religious culture resembles, in many ways, that found in the Old World. The Ojibwa come, in part, from the Hopewell Culture of the Great Lakes, who were mound-builders and copper-users, commonly associated with the Adena and the Mississipian cultures (who were related to the Aztecs). Its metal-working and similarities to Old World religions suggest that the same mystery tradition that accompanied the origin of states in the Old World may also have accompanied the origin of states in the New World.[907] Like many of the religions the world over, the Ojibwa's religion is esoteric and keeps secrets from those uninitiated in a given lodge, has rites of passage and a degree system of merit, maintains written texts (in the case of the Ojibwa, hieroglyphics on birch bark scrolls), and convened in councils of initiated elders. Joseph Campbell says, in *The Historical Atlas of World Mythology*, that

> The Midewiwin (Grand Medicine Lodge) created such scrolls as mnemotic records of the complex sequences of songs and prayers used in their various religious rituals. Each figure impressed into the birchbark represents a given moment in a particular sacred ceremony.[908]

Very similar sorts of esoteric traditions are found among the mystery cults of the Mediterranean and surrounding areas, such as those in Greece, Thrace, Rome, Egypt, Turkey, Israel, Syria, and so on. The Kurgan expansion out of the Pontic Steppe and into Europe, explored by Marija Gimbutas, and which had brought about the Indo-European languages, had also, like the Hopewell and Mississippian cultures, been characterized by mound-building. Both the Europeans and the American Indians are known to have largely come from peoples populating the steppes or mountains of Eurasia or Siberia.

---

[905] Fuller, 29
[906] Kropotkin, 114
[907] However, it may also be an example of biological convergence
[908] Campbell[1], 168

The religions of many peoples worship the power of storms, sometimes as thunderbirds, or as storm gods like Thor, Zeuss, or Yahweh, and, like the Yamnaya through whom the proto-Indo-European language may have been channeled, and its associated religion, from which would be derived the Aryan relgions of Avestan or Zoroastrian religion and Vedic or Hindu religion. The Yamnaya, it is reasonable to believe, were ultimately *pantheists* at their foundations, believing that Nature as an undivided whole is God. That is, they were likely aware of the power of *Acts of God*— such as climate factors and catastrophes, in legal jargon—, and gave this term its underlying sentiment, connecting natural disasters with spiritual or religious affairs.

In a certain respect, and depending on how it is interpreted, *The Bible* is a an oral history documenting human evolution. For instance, some have interpreted *The Bible* as describing the creation of the most recent, perhaps, of prior worlds, worlds that contained human races known as *pre-Adamites*. By this account, the story involving Adam and Eve was a story of the creation of a newer race, the Adamic race, while the Serpent represented a pre-Adamite race. By other accounts, still, the pre-Adamic people mixed with the Adamites, as represented by Eve's acceptance of the Serpent's apple, apparently representing sexual temptation. By this view, then, Cain and the grandchildren of Adam and Eve, the Adamites who had to take up pre-Adamite wives, were of the "Serpent's seed."

The Serpent has been associated with "fallen angels," which have been interpreted to be of relation to the gods or God, who might be understood to be of relation to the proto-Germanic chieftains, known as *Godi*, though perhaps from earlier Indo- or proto-Indo-European renditions. The "gods" of old were ancient peoples who had been pushed into the refuge zones of the mountain tops, and who had learned the power of controlling water therefrom and of retreating thereto after terrorizing the people below. To them were paid tribute, an "appeasement of the gods." Some of the gods were understood to have mixed with humans, creating races of giant humans, known in *The Bible* as the *Nephilim*, among which some interpretations include the Serpent.

Those who suggest that *The Bible* begins at a later creation point to the passages about God's spirit moving over the waters of "the deep," and of the early appearance of light before the Sun and Moon. The waters of the deep gave way to dry land, upon which plants and animals were created, followed by Adamic man. Proponents of the pre-Adamite idea often suggest that this is much like the Great Flood later experienced by Noah and his family, suggesting that the beginning of the creation told of in *The Bible* was the ending of a prior creation, an ending that was much like the ending of Noah's world, itself a reversal of creation.

While the Great Flood appears to be the most drastic of the Acts of God told of in *The Bible*, there are other accounts of devastation as well. Take, for example, the divine retribution taken upon the builders of the Tower of Babel, who had their languages scrambled, or the cities of Sodom and Gomorrah, for their homosexuality,[909] or the Ten Plagues of Egypt brought by God's taking favor upon Moses and due to the Pharaoh's unrighteousness. Or consider the smiting of the people of Jericho by Joshua and the Israelites, who have been considered to have been Nephilim survivors of the Great Flood. In each of these narratives, whether directly an Act of God, or indirectly by God's command, the wicked are annihilated and room is made for better, more righteous people.

[909] Anal sex between man and woman is not properly considered sodomy because within an otherwise reproductive relationship. Also, Sodom was as much burned for poor hospitality as for homosexuality, and this must be considered in the definition of *sodomy*.

While told in terms of the supernatural, these sorts of events could just as well be understood to represent a primitive reflection upon the workings of natural selection[910] and punctuated equilibrium. The "gods," "Giants," and "pre-Adamites" may all have existed in their various forms, being selected against both by natural forces as well as by intersocietal ones, in particular, those of the post-Adamites and post-Noahides, especially the Abrahamics or Hebrews.

Acts of God were particularly important for the mystery cults, and it was the duty of priests to maintain astrological charts and to preserve the secret knowledge of catastrophes and zodiacal occurrences. The ancients, such as Ptolemy, held that the zodiac moved between combinations of heat or cold and wetness or dryness, such that increasing dryness and cold temperature or, on the contrary, humid and hot, would be understood to fit into the paradigm of the zodiac. Their astrotheology spoke of the gods and the *seven wanderers*— or *naked eye planets* that could be seen to "move" as the Earth went about its precession in the Great Year[911]— in the same light, such that the planets and gods shared names. As Jan Irvin and Andrew Rutajit write,

> By removing this knowledge from the common folk, these educated priests appeared to be able to perform magic when they could do simple things like predict lunar and solar eclipses. They could tell the masses how many days until planeting season, or they could announce the beginning of spring. How easy it would be, by understanding the heavens, for a king or clergy to protect their people (who could not read or write) into believing that they actually had influences over a solar eclipse. The ancient cultures had great knowledge of mathematics, as evidenced by their architectural alignments to the stars.[912]

The Pythagorean concept of the *harmony of the spheres* spoke of the planets as if moving in musical harmony. The phases of the Moon would also be important, and would contribute to the understanding of the months. However, months being associated both with the phases of the Moon and with the periodic cycles of women, there was some conflict between the matrilineal, Mother Earth belief system, on the one, and the patriarchal Sun and Sky religions, on the other. As time went on, various gods would be defeated and sometimes banished to the mountains, as can be found in mythology from Greece (as with the Titans) to Tibet. The Western mystery cults and philosophy surrounded a theme that may be best illustrated by the myth of Prometheus, who is understood to have stolen fire—apparently representing knowledge or wisdom—from the gods, and to have given it to humankind. This fire would be associated with the Western mystery tradition and with philosophy.

Sex magic, such as selective breeding and backcrossing (thereby producing "reincarnation"), might go back all the way to the Natufians and probably became especially widespread with the breeding of animals by herding peoples, who would then start to apply their newfound knowledge to their own species. Natufian artifacts show a prevalence of hermaphroditic deities.

Pleitropy occurs when a particular mutation, a change to a gene occupying a *locus* or location in the DNA, produces multiple changes in phenotypic expression, sometimes producing an altogether different organism, as in the case of *universal pleitropy*. Selective breeding programs of sex magic favoring pleitropic outcomes might have been favored for a long time, and may have influenced the prevalence of worldwide legends involving twin brothers, such as Jacob and Esau, whose phenotypes are described as very different, Nut and Geb, Hengrist and Horsa, Gog and Magog, Castor and Pollux, Romulus and Remus, etc. Various kinds of relicts and mutants arise from experimental breeding, as

[910] Here including social, intersocietal, and other forms of "artificial selection" as well as ecological selection
[911] The Great Year has twelve signs just as a Solar Year has twelve months
[912] Irvin and Rutajit, 14

well, such as wolf-men, hermaphrodites, synesthetes, and others, sometimes a *savant*, or exceptionally gifted person, though often handicapped in areas of life outside of their particular gift. If inbred, particular traits can be enhanced in the next generation, leading toward speciation. In this way, particular phenotypes might be allocated to particular tasks, leading to a caste system wherein biological or familial specialization is attempted. Buckminster Fuller describes such a tendency to specialization as evolutionary degeneration, saying

> We can comprehend how [...] male and female human swimmers gradually inbred pairs of underwater swimmers who held their breath in their lungs for ever-longer periods, and after many inbreedings of largest lungers and as many outbreedings of general adaptability organic equipment, the progeny developed into porpoises and later into whales.[913]

That's about the wildest idea I have read in a long time, an idea older than myself nonetheless. I'm not sure about porpoises and whales, much less chimpanzees, being degenerated from humans. But, nonetheless, Fuller's thought experiment does outline what overspecialization might do to a species, particularly our own. After all, Robert Chambers, in his *Vestiges of the Natural History of Creation*, describes humans as being analogous to a crow in the bird world, but in regard to the animal world as a whole. Chambers describes a crow as being less specialized than the other birds, having characteristics representing the wider gambit and being found across a wide range of habitats. Likewise, he suggests that humans are the most multitalented of the animal species. He says "[m]an, [...] considered zoologically, and without regard to the distinct character assigned to him by theology, simply takes his place as the type of all types of the animal kingdom, the true and unmistakable head of animated nature upon this earth."[914] If this is the case, then Fuller seems to be describing devolution by way of specialization as a step away from this condition, a condition wherein humans really are "made in the image of God" in a certain sense. Such specialization, among humans, cannot get any more serious than within a caste system, which may begin to have the results that Buckminster Fuller's possibly otherwise cuckoo scenario is describing. Indeed, Fuller seems to believe that the caste system has already had some of these results, suggesting that the stupidity of poor people results not from an inherent lesserness, but from a lack of nutriment during the gestation phase before their birth— a condition that is non-reversible but preventable— and from overspecialization.

People have eaten each other for a number of reasons, many of them sourced in magical purposes. They have eaten those of their own group at times, for instance, in order to provide an honorary burial or to maintain their spirit or energy in the family. They have eaten those outside of their own group similarly to capture their spirit, energy, or power. The idea behind this also fueled ancient Chinese medicine, such as in Li Shizhen's medicinal. It is that "like attracts like," that by eating certain things you attract the qualities of those things. I worry that cannibals may have been necessary for evolution. If *Homo antecessor* was a cannibal, and if cannibalism has a connection going all the way through to Denisovan or even until today, one might imagine a world in which cannibals crawl from out of their subterranean lairs, feast on us other humans, only to travel the world, raping both men and women, and thereby spreading genes, gained by others through cannibalism, and the practice of cannibalism itself, around the world. Cannibalism can result in prion disorders such as Creutzfeldt-Jakob Disease, or "Human Mad Cow" disease, which themselves express themselves as Dementia, of relation to the word *demented*, meaning "insane and cruel." For others, still, cannibalism is not an act of reverence, nor of

[913] Fuller, 8
[914] Chambers

spiritual vampirism, or even of sexual perversion, so much as it is the ultimate, amoral and antinomian act of atheism, a statement against the existence of God.

Homosexuality

Homosexual means "same sex," especially as it regards *homoeroticism*, or erotic attention toward the same sex, not to be confused for *homoamory*, or "love of the same." A later, related and derived concept, *homosocial*, applies to social relationships of the same sex. Homosexuality was considered a mental illness in the United States until around the time of the Cold War.

We have been made used to thinking of male homosexuality to simply be a displaced fondness toward females given instead toward men. However, this is not exclusively, and perhaps not even primarily the case. It is also common to think of a male homosexual as a particularly effeminate man, frail of body and speaking with a lisp. But this is just a stereotype. And while it may be true of some gay men, *hypo*masculine ones, the opposite also exist. At its origin, male-male homosexuality has biological foundations in agonism.

What *hypermasculine* men, or men who are "extra manly," like about one another is different from what men like about women. Hypermasculine homo- and bisexuality cannot be separated from manhood, manliness, masculinity, and other such concepts, and certainly not from homosociality. Hypermasculine sexuality is about one-upmanship, dominance, and supremacy between men. Men who find the presence of other men to be erotic often find arousal from the competitive aspect of being with other men. Often, though not always, this competitiveness is centered around access to women (as may be hidden in "locker room talk"). Indeed, hypermasculine homosexuality, bisexuality, or just homoereoticism, may even be, at times, driven by heterosexual competition. However, hypermasculine homosexuals or bisexuals may be more interested in the competitive aspect than in the actual relationship with women, who may themselves become "trophy wives."

Hypermasculine men in general tend to pair with hyperfeminine women, while hypomasculine men and hypofeminine women tend to pair together. But the relationships are not the same. Hyperfeminine women tend to be submissive housewife sorts who admire and depend on the power of their male partner, and who look after their children, but who complain about the frequent absence and spontaneity of their hypermasculine partner, who is more inclined toward homosociality and perhaps even homosexuality than toward socializing with his wife. In short, hypermasculine men and hyperfeminine women don't share as much in common as hypomasculine men and hypofeminine women do. Hypermasculine men frequent homosocial environments, which may become home to extramarital affairs.

In today's terms, hypermasculine men are not generally going to be found marrying other hypermasculine men or men in general, but are instead associated with movements such as MGTOW, Men Going Their Own Way, or with *incels*, "involuntary celibates." The classic hypermasculine archetypes are things such as sailors, soldiers, adventurers, mountain men, and cowboys, or, if married, businessmen who ignore their wives to socialize with other men. Rugged men. Men who mean business. Rarely, if ever, does homoeroticism as is found among hypermasculine gays meet with homoamory, though trauma bonds formed by mutual abuse may indeed arise, and from those relationships of sexual competition dear enemies and even lifelong cohorts may be established. Homosociality is certainly preferred, leading at times to clashes with feminism.

Hypermasculine men eroticize toughness, independence, perseverance, and a straight face against all odds. These are not feminine characteristics. Sexuality between hypermasculine men is not the same as sexuality between a man and a woman. It is not based on a love of womanhood, womanness, or femininity, but instead often involves the rejection of these, especially as it relates to a male partner. Instead, hypermasculine men, and even gay men more generally, find masculine or manly traits to be erotic. This sort of eroticism, driven by the love of men, is not a soft, loving affection as one might find a man having for his wife. It is not a love driven by mutualism, but instead by agonism.

Indeed, a strange agonistic behavior can be seen between males of many animal species, called *homosexual mounting*. It is sexual mounting of one by another, typically during displays of threats or between violence, by males of the same species. This homosexual act, which is seen between dogs for instance, though certainly not limited to them, is clearly a display of sexual domination. Similarly, men in prison are commonly raped in acts of dominance by other men. According to Christopher Morriss-Roberts, homosocial athletic environments with shared lockerrooms tend to judge one another based on penis-size, with one being more likely to climb the ladder of influence according to the size of one's penis.[915]

Among gay men, the language of "tops" and "bottoms" is often used, referring to their relative positions to one another during anal intercourse. The top is the penetrating partner, and is generally considered to be the more masculine between the two, while the penetrated partner's role is considered to be more feminine. The "top" sort of gay man is likely to be prone to a hypermasculine persona, one which values dominance of others, while the "bottom" is considered to be submissive.[916] Hypermasculine gays struggle with one another to be the one on the top. In Ancient Rome, there was no differentiation between a straight man who had sex with only women and one who at times had sex with men, so long as the man himself was not ever penetrated, thereby remaining "masculine" and "active" rather than "passive." The popular pronouncement, "You're fucked," takes on new meaning.

The type of sexual arousal that comes with this is relatable to violence. Indeed, many serial killers, including cannibalistic ones, such as Albert Fish and Jeffrey Dahmer, were homosexuals who found murdering or devouring their victims to be sexually satisfying. John Wayne Gacy also described a sexual satisfaction from killing. An unfortunately popular term has entered popular culture describing more generally an arousal from violence. It is *murder boner*. While unrestricted to homosexual violence, it is likely relatable to it. This is not to say that hypermasculine homosexuals are all murderers or cannibals, who get off sexually on crime, but that murder and cannibalism might be able to tell us something about hypermasculine homosexuality, and about the related concept of *sadomasochism*, the application of pain to sexual interaction.

When we think of homosexuality we usually pair it with femininity, but this is what homosexuality looks like when it is paired with masculinity.

Still, hypermasculine homosexuality may have some connection to the more exoteric hypomasculine homosexuality. According to the abstract of "Human social stratification and hypergyny: toward an understanding of male homosexual preference," by Barthes, *et al.*, in *Evolution and Human Behavior*,

---

[915] Interestingly, Ancient Greeks often depicted their heroes with average to small flaccid penises to place intellect above sexual prowess

[916] This may be considered similar to the distinction between dykes and lipstick lesbians, with dykes taking on a particularly masculine persona while lipstick lesbians express great amounts of femininity. It is not rare to see the two paired together. Both "tops" and "dykes" may be described as *butch*. "Bottoms" and "lipstick lesbians" are considered to be *femme*.

hypomasculine homosexuality is maintained by stratification and hypergyny, and accompanies a pleiotropic advantage.[917] According to another version of Barthes's abstract, there likely exists a trait enhancing fecundity in women that "also promotes the emergence" of homosexuality in men. They say that in a stratified society a "relatively high frequency" of gays "could be maintained as a result of the social ascension of females signaling high fertility (hypergyny)"[918] to hypermasculine men. This process is apparently, or hypothetically, responsible for the genesis of hypomasculine homosexuality in men.[919] Their findings highly supported this hypothesis.[920] Indeed, hypergyny is similar to inbreeding and can result in inbreeding or backcrossing, and royalty has long had flamboyant and homosexual persons among it, such as the famed Fritz "the Faggot." Alternatively, Charles Socarides, Irving Bieber, and Lionel Ovesey have suggested that homosexuality is a curable developmental phenomenon, typically understood as a mental illness. According to Socarides,[921] homosexuality stems from what Theodore Lidz would deem "skewed relationships of schizophrenogenic parents,"[922] particularly a mother who controls her son and a father that does not defend his individuation. Others have suggested that homosexuality is common among fatherless males, as sons without fathers look up to hypermasculine figures in order to model themselves by, thereby becoming gay. Joseph Nicolosi has developed a conversion therapy to assist homosexuals in leaving their vices and regaining a virtuous heterosexual impulse again.

States and Governments

Honest social scientists have long-admitted the cunning and violent origins of political authority. Perhaps none were more clear about this than Pierre Proudhon and Herbert Spencer, though they would be followed by others, among them Franz Oppenheimer. Unlike earlier political theorists, who believed political authority resulted from a social contract, the sociologists and anthropologists assured that political authority could be reduced to aggressive use of violence, often as propped up and supported by popular superstitions and ignorance. They would be opposed by social thinkers such as Emile Durkheim and others of a *functionalist* persuasion of political authority, believing that political authority arose not antagonistically but to serve a particular function. The position of Proudhon, Spencer, and Oppenheimer would often be categorized as *conflict theory*, opposed to functionalism, believing political authority to arise from aggression.[923] Patrick Nolan and Gerhard Lenski's view is considered a form of *compatibilism*, that political authority was both an aggressive encroachment and

---

[917] Barthes[1], *et al.*

[918] Barthes[2], *et al.*

[919] If this is the case, then homosexuality is a class issue and form of evolutionary degeneration, which would not exist without social stratification. Even still, being homosexual is not an act of aggression or an imposition of costs onto others, and in itself is not immoral. It is therefore not an offense, and should be tolerated. It's social stratification and polygyny that is the issue, homosexuality being only a symptom.

[920] It seems obvious that a healthy balance of masculine and feminine is maintained through the proper pairing of masculine and feminine individuals, a balance that is thrown off by the selection of hyperfeminine (or having "increased fertility") women by rulers, a pairing not always matched by the ruler in measure of his masculinity. The imbalance produces feminine men who may take to homosexuality. Her brothers may have been only mildly masculine, but within acceptable limits for a heterosexual. Her own tendency, as a hyperfeminine woman, is to seek hypermasculine men. But this tendency is distorted by economic power, which may be in the hands of a low-masculinity ruler. Paired together, hyperfeminine women with slightly masculine men, especially through generations, feminine men result who may be homosexual.

[921] Whose own son was gay

[922] *Schizophrenogenic mother* had been a term coined by Frieda-Fromm Reichmann to describe the mother of a schizophrenic

[923] However, their position was not conflict theory regarding society, but, in contrast to society, the state. They were functionalists in regard to voluntary interactions in society.

an innovative social function, a view not entirely different from Proudhon and Spencer, if not also Oppenheimer.

Nature demands that her niches be filled, and her continual and transcendental niche for higher biological order—the future—is no exception. But the means by which higher order and justice comes about at all is by way of the dominance of those who are most qualified to provide it. This by no means always entails purity in justice toward others, but often involves the in-group practices of higher forms of order in competition with, and prevailing over, groups practicing less developed forms. Nolan and Lenski relay to us that we can see African societies as "a valuable opportunity to study the early stages of political development," and that an essential element of the method of building states might be that "the head of a strong clan begins to take on, as retainers, men who are not related to him, thereby overcoming one of the traditional constraints on power and its expansion." They say that the "retainers are usually individuals who have been expelled from their own kin group for misconduct or whose group has been destroyed in war or by some natural disaster, and they offer their allegiance and service in exchange for protection and a livelihood."[924] An example of the co-option of tradesmen by the state, Haviland *et al.* tell us that a "governing elite also emerged in early civilizations. The challenges facing new cities faced because of their size and complexity required a strong central authority. The governing elite saw to it that different interest groups, such as farmers or craft specialists, provided their respective services and did not infringe on one another."[925]

States and governments may be seen, in some respects, as participants in societal forms of *obligatory mutualism*. Some symbiotic relationships are not neatly placed into the categories of *mutualism*, *parasitism*, and *commensalism*, as many symbiotic relationships have elements of two or more of these. This is particularly the case with relationships that have been deemed *obligatory mutualism*, a logical contradiction of sorts, but which has been used to describe relationships such as those between cultivators and the cultivated. For instance, the relationship between some ants, such as those found in the *Attine* or "fungus-growing" ants, and their fungi, has been considered a form of obligate mutualism, as some forms of fungi have become dependent upon the ants for survival and the ants upon their fungi gardens. This most likely began with ants, such as the Leaf Cutter Ants, bringing material into their tunnels and chambers for fungi to live upon, keeping the fungi also away from diseases. Those of the *Oecophylla* or "weaver ants," or of *Lasius* the "meadow ants," and the scale insects and aphids they milk for "honeydew," are similarly obligated to associate. Similarly, humans have become dependent upon their cultivated plants and domesticated animals, which have likewise become dependent upon humans. While a perverse form of it, it is a form of mutualism in that ants and humans do provide sustenance and protection to their symbionts. However, the perversion to the mutualism, the entrapment and consumption aspect, is a form of parasitism. Very similarly, state-formation involved the entrapment and domestication of humans by humans. This involved some degree of mutualism, both of the in-group sort between conspirants and between the conspirants and the victims. To establish a state or government, a mutualism had to be established between the conquering parties so that a concerted effort could subject their victims. However, there also had to occur some degree of mutualism between the conquerors and conquered, and this often took the form of diffusion of the dominant culture's values, and of their genetics, both of which supplied a net success, to the remnants of the conquered. This involved forces of intercultural and intersocietal selection. And it supplied the ingredients for *pseudomutuality*, a dynamic found within narcissistic family relationships in which

[924] Nolan and Lenski, 145
[925] Haviland, *et al.*, 128

mutuality is feigned while coercion is nonetheless at play, particularly in regard to a demand of conformity to the preferences of the narcissist, typically a parent figure.[926]

Governments, which represent a mutualism on behalf of a conquering ruling caste—the clan, tribe, kingdom, or empire—, would practice something more like parasitism upon the abiding caste. They would dominate it and force its constituents to endure labor. According to Patrick Nolan and Gerhard Lenski, in advanced horticultural China, like in many other advanced horticultural societies, "social inequality was the rule in these societies." Further, they suggest that there "were two basic classes, a small warrior nobility and the great mass of common people," and that the "warrior nobility were the governing class and lived in walled cities that served as their fortresses."[927]

However, unlike true parasitism, positive results accompanied the exploitation, including rather absolute increases in the overall inheritance of technology and commodities. Without hierarchy, and the break from the primitive anarchy of the hunter-gatherer toward the dominance of the mutualism of the nobility, such a surplus would not be possible, because population growth would soon grow to match and consume the resources. A social structure and corresponding myths were necessary for such a surplus to develop, and for it not to be consumed by those who produced it. And this surplus would be used by ruling classes to afford luxuries for themselves and privileges for specialists. Nolan and Lenski suggest that "[t]he larger populations of horticultural societies are due primarily to their greater economic productivity", and that

> this shift in subsistence technology [toward horticulture from hunting and gathering] was the critical step that made possible the production of *a stable and dependable economic surplus*. Hunters and gatherers may produce surpluses for brief periods, but a complex institutional system cannot be built on such an uncertain foundation. Full-time occupational specialization [...] is possible only when an economy becomes productive enough so that some individuals regularly produce more of the necessities of life than they and their families require.[928]

Carroll Quigley says that if a "new society born from such mixture" as is needed for development to occur, as through societal hybridization, "is a civilization, it has an instrument of expansion. This means that inventions begin to be made, surplus begins to be accumulated, and this surplus begins to be used to utilize new inventions."[929] Instruments of expansion include such projects as slavery, serfdom, and usury. In Quigley's perspective, instruments of expansion are among the most important projects to be undertaken for the sake of civilization's evolution. While instruments of expansion and the creation of surpluses[930] are necessary for the existence and dominance of, and exploitation by, the ruling class, the Mutualist Francis Dashwood Tandy presents another view, one much more related to the perspective of the governed. He says, in *Voluntary Socialism*, that

---

[926] Pseudomutuality exists when a relationship appears to be mutual in some way, but is not really so. *Pseudomutuality* is a term that is especially used in mental health circles, particularly as found among narcissistic family cults. In such arrangements, much effort is put toward a veneer of mutuality, while in fact there is a manipulistic dynamic coming from the heart of the family cult, the narcissistic abuser, typically a patriarch or matriarch. In such a family, children are expected to fulfill their roles without any friction and without regard for their own autonomy, sacrificing always their individuality for the support of the family. The apparent lack of friction looks to outsiders as if there is a healthy family dynamic without conflict, but this comes at the cost of stifled individuality on behalf of the children, who do not receive support if it is not toward something that excites the cult leader.

[927] Nolan and Lenski, 121

[928] Nolan and Lenski 113

[929] Quigley, 148

[930] Not to be confused for abundance

> rent, interest, and profit are the elements that constitute the difference between the cost of acquisition and the labor value of commodities—the difference between the amount of labor embodied in a commodity, and the price demanded for it. They are spoken of collectively as usury, or surplus value.
>
> [...]
>
> A very large proportion of the wealth of the country, is owned by a very small per cent of the population, and that small portion derives its incomes from its usury, which are far greater than its power of consumption [...] It saves a surplus annually which is again invested. The result of this is that surplus value has ever a tendency to increase until it absorbs all of the wealth of the country. [931]

Tandy says,

> Every product of labor is created only with the expenditure of a certain amount of vital force. So he who robs me of the product of my labor, robs me of a portion of my life.[932]

This robbing of an individual's labor is the purpose for which government serves. In *The State*, Franz Oppenheimer says that

> The state, completely in its genesis, essentially and almost completely during the first stages of its existence, is a social institution, forced by a victorious group of men on a defeated group, with the sole purpose of regulating the dominion of the victorious group over the vanquished, and securing itself against revolt from within and attacks from abroad. Teleologically, this dominion had no other purpose than the economic exploitation of the vanquished by the victors. No primitive state known to history originated in any other manner.[933]

Government comes etymologically from words meaning "to control, or to steer (as in a maritime vessel)"—*gubernare*— and "the mind"— *mentis*—, literally meaning "to steer or control the mind," or "mind control." As a point of fact, a government is the group of people who administer the vessel of the state or a sub-state or otherwise a hierarchy within a voluntary association, exclusive from the lay-membership or as a majority. That is, a majority, given power over a minority, is also a government, though this is less common than government by a minority, such as by a board or council. Government is that individual or body of individuals who are empowered to make decisions on behalf of others, not requiring their consent or, sometimes, even their voluntary association.

The difference between a government and a state is that government is the body of people who steer the state, which itself is the institution. The government changes all of the time, when new administrators fill its seats, but the state, the institution, remains the same. A state requires a government, while a government does not theoretically require a state, or is not itself a state. However, in reality, all governments do require states to exist, as no government has shown itself to exist independently of a state or state-influenced culture. Governments that are not states, as it were, are either extensions of existing states or are mimicking the behaviors of states, mistaking them to be inevitable or fundamental to human organization. Examples of governments that are not themselves states include formal hierarchies in associations, such as in church, school, and the workplace. Formal hierarchies such as boards or councils are themselves governments, though they may not necessarily be landlords or

[931] Tandy, 86
[932] Tandy, 91
[933] Oppenheimer

states.[934] Formal hierarchies that do control territory should be considered sub-states, because if not for larger powers than themselves they would be in control over the territory.

A *state* is a territorial "monopoly on the legitimate use of force," as defined by Max Weber. *Territorial monopoly* refers to the control of a given area, as with private or public property. *Legitimate use of force* is that use of force that is acceptable to the wider society, that is, which will be tolerated as a necessity, typically, though not always, an act of self-defense or defense of others. A *monopoly on the legitimate use of force* is a condition wherein only an official party is tacitly granted the capacity to exercise the legitimate use of force; that is, where it is illegal for anyone other than the government to use force in certain acts of defense. The problem with this is not that legitimate use of force is being exercised by government, but that legitimate force is restricted from use by common people, despite its legitimacy, and that this restriction on the legitimate use of force keeps the population from keeping government in check; that is, from keeping the government from using *illegitimate* force along with its legitimate use of force, and from hindering legitimate uses of force by the population itself when government refrains from using legitimate force itself (which it can also do as a monopoly on violence). The monopolist of the legitimate use of force easily becomes a wielder of illegitimate uses of force and refrains from legitimate uses of force and keep others from stepping in to use it when it is to its own advantage. In this way, governments gain the power to dominate and oppress their people, becoming states with territorial control, and so landlords to their subjects or citizens.

Perhaps the most essential characteristic of a state or government is that of a *ruling class* or *ruling caste*, a group of people, typically a family or clan, who rule others in their ethnic, tribal, or national group. This rule may be after-the-fact, as with judgement by judges unaccountable to the community at-large, or it may be before-the-fact, as with a decree that declares lawful and unlawful behavior. Communities may exist without ruling classes, in which case rules may be applied by a particular member, but the rules are decided, either before or afterhand, by the community at-large or by its legitimate officials that are directly accountable to the community at-large and who do not have any special privileges, only special duties.

The development of states accompanied hierarchy, social stratification, and exploitation. States were simply conditions established through the monopolization of violence by a given clan or tribe. The first powerful states seem to have arose where settlement came fairly easy, and especially along waterways. They may have developed natively, but were probably created by cults of clans or tribes with loose familial or traditional relationships, establishing themselves as a governing, administrative class over those whom they had conquered.[935] States and their governments have always had some degree of mutuality to them. Even monarchs have relied on a court of trusted advisors and noblemen, to whom they held some responsibility. Mutual aid in defense and offense, established upon mutual understanding, allowed governments to produce a higher degree of order, and to impose it onto others who had established lesser mutual aid amongst themselves. And we have them to thank for the development of agricultural civilization. But any existing mutuality that was shared between the ruling class did not extend to the ruled, and was often impure even between nobles. So governments, or states, cannot be considered any thorough variety of Mutualism, or the Mutualism we are speaking of when we

[934] Landlords differ from states only in not maintaining a monopoly of force, but instead being subject to another's monopoly on force. If not for the monopoly on force, landlords would have to establish a monopoly on force directly—thereby becoming states—or would cease to be landlords as their state-granted privileges wither away. Landlords, then, are sub-states, similar to all non-state governments.

[935] In many cases, this probably included the spread of Steppe peoples during the Kurgan expansion

speak in a specific or narrowed-down sense. Nonetheless, they do demonstrate the cultural power of mutualism, in a wide and general sense, over relative non-mutualism.

Humanity's purpose is emergent, becoming. One makes it happen. One's purpose is to be happy, and in order to be happy one sets goals, makes plans, creates value, and takes action to make the things that make one happy happen. Social classes and political hierarchy only serve to restrict this process, to restrict one's will, one's purpose, and to dominate humanity as part of the lower plane of existence. Social class and hierarchy is a material attempt at stealing one's divinity as a creative, free, and self-sufficient being. God has given each a will, and what is social class but the theft of the freedom of that will, enforced by physical violence, or restriction of information? Class is the theft of divinity, as one's divinity is expressed in one's ability to reason, set goals, and create change, and being told what to do is the theft of one's own creative potential. God gave humanity something that supersedes the ability of other animals: the ability to make decisions and express one's will to a higher degree. Class restricts this, reduces humanity to beasts of burden. It's not the fault of the powerful alone, it is also one's own when one allows domination to go unchallenged. One's learned helplessness plays a large role. Just as a teenager must claim themselves from their parents as they reach individual adulthood, it is one's class obligation, one's human duty, to claim humanity and oneself from one's masters and mature with humanity into a strong, self-supporting, and capable society. One is drawn to the ideas of maturity and freedom because they are good, and true, and, for this reason, it is society's destiny.

Egyptians and Canaanites

Stan Gooch, in *The Neanderthal Legacy*, and Michael Bradley, in *Chosen People of the Caucasus*, have both argued that Middle Easterners such as Jews and Arabs have a high degree of Neanderthal influence in them that separates them from other people, including other "Caucasians." "Craniometry," by Joseph Jacobs and Maurice Fishberg, in the *Jewish Encyclopedia*, says that the "modern European Jews are shown by craniometrical evidence to be a pure type," and that the "Sephardim are almost as brachycephalic as are the Ashkenazim," which would seem to discount this idea except for claims with regard to Apidima 1 being a brachycephalic Neanderthal. Neanderthals seem to have been very robust, but somewhat short-statured, and hairy, with large hooked or "beaked" noses. For this reason, Michael Bradley and others suggest that the European legends of creatures such as trolls, gnomes, and dwarves and such things likely originated as stories about these Neanderfolk. He says, "Their former genetic existence is still evident in the hairy, stocky and heavily-built European mountain people living today."[936] Bradley suggests that *Homo georgicus* of the Dmansi Hominins from the Caucasus displays features from *Homo habilis*, and may be a source for Neanderthal coming from Out of Africa.[937] He suggests that Neanderthals were lively counters, enumerating much and developing music from their love of number and proportion. He points to evidence that Neanderthals were the first to enumerate things in time, such as by enumerating moon or menstrual cycles by way of notches on bones. These are notably areas of interest and practices of Middle Eastern cultures. He says, further, that

> Neanderthals must have been fascinated with the number "One" or 1. It is the sudden difference between nothing and something. "Everything" that exists can be viewed as multiples of "One," but without "One" there is nothing. I have suggested, therefore, that Neanderthal and "Highly Neanderthaloid" people, had a tendency toward monotheism, the conception of just One God who created "Everything." And, because

[936] Bradley[1]
[937] See Bradley[1]

> they apparently could not render anything visually, this One God would have been an totally abstract entity.[938]

And what is more, he says that "simply because they could not draw or paint very well and did not value or respect that ability, the Neanderthals and 'highly Neanderthaloid' people would have viewed the figurative art of other people as idolatry."[939] Bradley, citing Trinkhaus, holds that Neanderthals were very in-groupish, and were highly aggressive toward members of different races. [940] He holds that Neanderthal genetics have contributed greatly to the people of the Middle East and are responsible for the turmoil of the area, and by extension to the world. While Bradley is harshly critical of Neanderthaloids and peoples derived from them, such as Jews and Arabs especially, he does take a moment at the end to make room for exceptions, suggesting that those individuals who have gotten past their "psychosexual aggression"— as he styles it— have been among the "most objective, humanistic, compassionate, and certainly courageous of human beings,"[941] owing to the fact that their logical thinking can be applied in a self-reflective manner as well.

According to Carroll Quigley, it was the banding together of Hyksos and Hapiru, Middle Eastern tribes, that would contribute toward the Hebrew people (something in a manner like the Scythians and Radhanites in the Iron Age contributing together to the Germanic, French, and Slavic people). Others have pointed to the *Shasu*, a nomadic band of Indo-European cattle nomads, perhaps derived from the Sumerians, as another element of the Hebrews or Israelites, connecting them to the cult of Yahweh. The Hyksos may have been a proto-Indo-European people associated with the proto-Scythians, or Aryans, and, as such, may have been Kassites (Kura-Araxes, Gutians) or proto-Indo-Europeans speaking a Eurasiatic language, though they may also have been Afroasiatic, or Semitic, speakers, if not Elamo-Dravidian. If Eurasiatic, it may, in some respects, represent a reuniting of the proto-Nordid with its Mediterranoid roots, of Kassites or proto-Indo-Europeans with their proto-Semitic kin. Carroll Quigley remarks that the Hebrews developed from a "kin-shattered" people, people who had lost the protection of their kin groups. "The cause," he says, "of this 'kin-shattered' condition which left the Habiru in a precarious social condition is fairly clear. Any individual," he says,

> who had killed a member of his own family obviously lost the protection of that family and became socially isolated. Or again, any person who had made a formal agreement to become the bondsman of another had voluntarily renounced the protection of his blood relatives. Similarly, men who bound themselves to fight for money could not expect their families to stand by prepared to avenge any injuries they might suffer in their combats. Such persons, without family to protect them or force the prince to extend his protection, needed some other protector. This was found by seeking the favor of Yahveh, the God of mercy [...][942]

Others among the kin-shattered may have been the albinos and others with features considered to be bad omens by their families. *Hebrew* may also have some relation to the *Hebros* (or *Hebrus*) *River*, or "White River," in the Balkans, perhaps attesting to their having been albinized.[943]

It appears that the Hebrews had come, at least in part, from the Indo-Aryans (before becoming Canaanites), a pattern that would be repeated by Scythian migrations. Gene D. Matlock, in "What

[943] There is another river, in Germany, known as the *Eber River*, which may also be of relation (as well as the Ebro in Iberia, and the Iberian Peninsula more generally)

Osama Bin Laden Doesn't Want You to Know About the Phoenicians and the Jews!" says that "[t]he history of the fathers of all non-Africanoid humanity, a.k.a., Scythians, and all civilizations began [...] in the Khyber Mountain region of Afghanistan[944] and Pakistan." The Khyber Pass was an immensely important trade route between Asia and Europe along the Silk Road. After some time, "the Khyberis or Kheebers came to own all the arable land, creating vast feudal estates," and even though "their religion preached that mankind should be humanitarian, they became selfish and cruel to landless peasants and nomads." He says that "their wealth in land and cattle grew," and that "the nomads or Abels (not cattle), had less and less free space to graze their sheep and goats," and so eventually "the Khybers and the Abels began to make war on each other. Little by little," he says, "the Abels were absorbed into the feudal system as slaves."[945] Quite similarly, the Mutualist and Unitarian minister, William B. Greene, says, in "Cain and Abel," that

> The meaning of the word *Cain*—which word symbolizes the character of him that was designated by it— is simply this: *an acquisition*, *a possession*. Cain was a *proprietor*. Moses is careful to mark this meaning strongly, in the verse where Cain receives his name: "And Adam knew Eve his wife; and she conceived, and bare Kain, and said I had gotten (acquired, possessed—Heb. *kan*ithi) a man who is Jehovah." The idea of royalty of self-centering power has always been attached to the word, *Kan*, *Kin*, or *Cain*. *Kanh* or *Kahn* is still the title of the monarchs of Asia; and the same word, with slight variation, is the royal title in the West of Europe. Thus, in Tartary they have the great Kahn; and, in England, the King. The word *Abel*, signifies *vacuitas*, emptiness, a mere vapor. Abel was, therefor, a *non proprietor*.
>
> The murder of Abel by Cain, his brother, is the establishment on this earth of unjust, jealous, exclusive proprietorship— proprietorship established by Cain at the expense of Abel: that is, the establishment of despotic ownership, of feudal tenures, of capital yielding rents, interests, and profits.

He says, "[b]y the mere fact of Cain's jealous and exclusive possession, Abel—the proletarian—is slain."[946] According to *The Book of Moses* of the Church of Latter Day Saints (or Mormons)— who officially take a highly anti-Masonic stance—, Cain had made a pact with Satan in order to gain hold of a great secret, thereby becoming Master Mahan (master with a great secret). Similarly, though later on, Lamech had become the Second Master Mahan, and when Irad had learned the secret, and began to make it public in some sort of apparent Promethean or Luciferian effort of enlightenment, Lamech had killed him. What could have been Lamech's secret? Why could it not be allowed to get out? *Master Mahan* has been sometimes equated with *Mohammedan* in suggestions that Mormonism was not only an anti-Masonic (*Master Mahan* being understood as *Master Mason*) but also an anti-Islamic sentiment, suggesting that this secret may have had been uncovered by the Muslims. Perhaps the spreading of this secret by Irad would have a leveling effect that would work against the ends sought by Lamech.

In a certain respect, and while kings may have played the role of Cain, in usurping the land, the chiefs, in their role as redistributors, would play the role of Seth, as portrayed by William B. Greene, who says that, when Seth was born, "[i]t was a man of system and conventions, that came into the world this time; for the name Seth signifies, appointed." Greene suggests that Seth was an official sort of man, as one might expect from a chiefly sort, a redistributor. Greene holds that *The Bible* speaks of an eventual

---

944 It's possible that, even before their time in Afghanistan, a portion of the Hebrews had come from Israel out of Natufian stock
945 Matlock
946 Greene[2]

unity between Cain and Seth, brought on through Cainan, saying of Seth's progeny that "Cainan is no other than Cain [...] with a softening of his characteristics." Greene speaks of "an alliance of Cain and Seth, contracted over the dead body of Abel." By Greene's view, it is the alliance of domination and formality that makes governments especially vile. Some hold that the Nephilim resulted from this union of Seth and Cain. *Nephilim* in such a case may not refer so much to giants as to the sons of rulers or judges, as is believed by the Samaritans and as is expressed in their *Targum*, or Aramaic translations. Rulers at this time were often known as the *sons of God*, which may have been the ruling class Sethites. John Yarker says,

> As Cain was the eldest son [that] would make him the prototype of the Turanians, whilst Seth would represent the prehistoric Aryan; and these races the Talmud would again reunite in the posterity of Lamech, which does actually point to the union of religion and art.[947]

The "prehistoric Aryan," Seth, was likely of some relation to the Nesiotids practicing the grade-taking systems that gave rise to the mystery schools later on. The Aryan-proper, however, intermixed with Cain's progeny—likely Capoid in league with Denisovan—, would be better represented by Cainan, standing over Abel's body with Cain's offspring, wielding the proto-Aryan grade-taking system to do so. Matlock, however, says that the "enlightened king of the time, whom we now worship as Yahve or Jehovah," probably referring to Shiva,[948] "intervened in order to prevent a ghastly genocide." He told the Khyberi to "quit monopolizing all the land and look for other ways to get rich, such as trading." As a result, some of them,

> both traders and farmers, spread out, going down to [...] Western India. On the Western coast of Northern India, they built shipyards and started making trading expeditions abroad. Their Sanskrit names, Pani (Trader) and Yuddhi (Warrior; Conqueror), clearly explain the part that each Hebraic clan had to play in this historic relationship. [949]

In this case, the original Sethites, Yarker's prehistoric Aryan and Matlock's proto-Scythians, would have been taking after Yahweh or Jahovah, their redistribution of the land being in line with his command. Matlock points out further, a bit more obviously, that these traders and the warriors were split into the Jews and the Phoenicians, which he groups together as Hebrews. Matlock continues, saying that

> Severe climatic changes in about 5,000 BC made much land unfit for farming and grazing, both for settled farmers and nomadic shepherds. During this time, the Biblical flood, actually confined to that part of Northern India, sent many hundreds of thousands of Indians fleeing to other countries. They became the fathers of Egypt, Greece, Rome, Sumeria, China, and other brilliant civilizations.

He says that the "root of all of this trouble" that exists presently in the Middle East, "stems from man's forgetfulnessand abysmal ignorance that two ancient brothers, who are ethnic twins, known by the family name of Kheeberi (Heber), have a spiritual, legal, moral, and historic right to share the land now known as Israel and/or Palestine."[950] The problem of Khyberi landlordism, however, which seems to have persisted since very long ago indeed, had been addressed by Jehovah, but clearly the words of Jehovah were not applied. Again,

[947] Yarker, 30
[948] In Sanskrit, *Jah* and *Yahva* are words meaning "leader" or "chieftain," and so refer to a mortal man
[949] Matlock
[950] Matlock

> With demand for craftsmen and miners down, the Cabeiri had no more pressures on them to offer high wages and incentives to workers. The jobless workers could not return to their farms because most of these had become unproductive - or appropriated by the Cabeiris. Food was in scarce supply; only the Quiviris could afford to buy it. Again, the landless peasants, unemployed craftsmen, and nomads declared war on the Kheeberis.[951]

Tov Rose writes similarly, in "Did the Ancient Phoenicians (and Israelis) Have Colonies in South America?" about two groups that he refers to separately as *Hebrews* and *Phoenicians*, saying that, at that time, "[t]hey were termed 'leaders of the Earth.'" He says,

> Around the fifteenth century BC, two powers were taking possession of the land on the Eastern Mediterranean coast. About the same time as the Hebrew (Israelite) nation was coming into Palestine, another power was being established on the sea coast adjacent to the North, a people whose career was definitely marked out for them.

Rose says further that "Phoenicia" would "become to the ancient world in material things, what the Hebrew had become in spiritual things."[952]

The Phoenicians had come, like other Canaanites, largely from the Ghassulian people, themselves having come indirectly from life East of the Red Sea in Arabia and beyond. The Biblican patriarch Abraham, who would come to inhabit Canaan,[953] also lived across the Red Sea, and is understood to have been born in Ur[954] in Mesopotamia, which, as part of Sumeria, had likely been a part of the Turanian or Sino-Tibetan complex at the time. His name may refer to the Aryan caste of Brahmins, perhaps in a negationary sense, *a-Brahmin*, and in relation to the Celtic *Brehon*, the Druid Class and legal system. [955]

Phoenicians set the standard for royalty, particularly with their royal or *Tyrian* purple, a color for which they were specifically known, named after the city of Tyre.[956] Tyrian purple, made from the secretions of a rare and sea snail, was scarce and valuable, requiring trained divers to find it. Thus, it became, like other rare and beautiful items such as jade, amber, cowry shells, or gold, a status symbol. This was especially established during the dominance of the Mediterranean by the Phoenicians, when they had established themselves as the very mark of Afro-Eurasian royal power. Still today, Tyrian purple is the traditional color of European royalty. Canaanites became so powerful because they were situated between the East and the West, and so learned to balance their worldviews, producing religion as a sort of proto-systems analysis.

[952] Rose[1]

[953] Where he was antinomian toward traditional Phoenician customs of child sacrifice, a progressive element of Judaism considering of the time

[954] According to New Age mythology surrounding the *Pleiadians*, as put forward by Barbara Hand Clow in her *The Pleiadian Agenda*, Abraham had claimed access to *ur*anium found deep beneath Ur, where he was born, that was associated with the god Anu, later used in a nuclear event. This uranium was apparently kept in the arc of the covenant (said by less religious authors to have contained a constitution). Perhaps the nuclear catastrophe or "war" on Sodom and Gomorrah, as the author puts it, was something more like an asteroid. Or perhaps there is nothing at all to this myth. However, it is interesting to consider what social importance a radioactive material that had fallen from the sky, perhaps destroying a city or more, would have in comparison to the amber, jade, gold, and other materials that drove entire pyramid schemes of gift-giving.

[955] Aristotle claimed that the Jews came from the Gymnosophist "philosophers" of India and were followers of Kalanos

[956] *Tyr* is also, interestingly enough, the name of a Nordic god

The Phoenicians are also understood to have contributed to the world the *phonetic alphabet*, or the alphabet that is based on particular utterances, such as the alphabet used here, in comparison to a language of characters or symbols, like hieroglyphs. The phonetic alphabet likely comes from out of cults of *synesthesia*, a nerve disorder resulting from crossed nerves in the brain that then deliver mixed signals—like sounds that can be seen—, wherein depictions of sounds were created as they were seen by synesthetes. Interestingly, Pythagoras, himself a synesthete and an organizer of secret societies, is attributed by legend with the origins of the alphabet, some say of runes.[957] Buckminster Fuller mentions that Ezra Pound had held that the invention of the phonetic alphabet was what the story of the Tower of Babel had actually been about. Fuller points out that people, before phonetic script was invented, had used pictograms or ideographs that might be understood by common people, but that

> Pound says that humanity was split into a babble of individually meaningless sounds while losing the conceptual symbols of whole ideas—powerful generalizations. You had to become an expert to understand the phonetic code. The spelling of words excluded a great many people from communicating, people who had been doing so successfully with ideographs.[958]

Nonetheless, and despite Pound's concerns and the setback they likely did see, the alphabetic language would allow complex and mundane ideas to be expressed to the advantage of the various "low mechaniks," witches and green magicians, and natural philosophers of the working class. This does not detract from Pound's populist concerns.

What had started out as a liberty-loving movement had devolved into the new face of oppression. Together, especially come the Iron Age, the Phoenicians, Jews, and Israelites—or, at least those who would go against the will of Jehovah— ransacked the Western world around the Mediterranean, just as their forbears had done around the Persian Gulf and the Indian Ocean in the largely Aryan-dominated Elamo-Dravidian societies. They preceded, with some periods of restraint, to establish themselves as the lords of the land and of the sea, as the kings—*Cains*— of Europe and admirals of her waterways. Matlock suggests that the various castes of India had broken down into what would become the Goths, Scots, Jutes, and various other groups that I, in agreement with Herodotus, attribute to Scythian or proto-Scythian lineages. This suggests, to me, that the Cabiri, who the Khyberi would become, might also be a source for the Israelites, later to become the Saka, or Saxons in particular. Their power would spread across Europe from the Mediterranean to the Scandinavian seas and from beyond the Volga River to the Atlantic Ocean.

The Phoenicians and Hebrews were related to the Cyclads of the ancient Aegean peoples, who appear to have maintained a very Polynesian-style society in the middle of the Mediterranean, perhaps themselves also, after having spread from Yamnayan influence, and having come from East of the Red Sea (or, on an expanding Earth, from the West, still from Polynesia) in reaction to a developing *Austronesian expansion*, wherein people from maritime Southeast Asia and Oceania expanded at least as far as Madagascar as well as up into the Red Sea. The Phoenicians and Hebrews could represent the introduction of an Austronesian-style

General combined range of Canaanites and Egyptians

[957] His father was notably an engraver of gemstones
[958] Fuller, 75

politics to the Mediterranean, such as that organized around Big Men and, perhaps especially, chieftains.[959] Such an introduction of Austronesian-style politics could have spread throughout the Mediterranean, informing the various maritime peoples of Egypt, Canaan, Greece, and Italy, and encouraging them to form chiefly and theocratic aristocracies legitimized by ideologies of redistribution. These sorts of maritime politics, possibly originally derived from contact with retreating Denisovans— who may have composed a primitive elite—[960] by New Guineans, might cause a schism upon their introduction to the coast, resulting further in reactions from those more inland, perhaps themselves more in line with the contact made with Neanderthal culture. This might spark a millennia-old conflict between the Law of the Sea, as lived by the Phoenicians and others along the Mediterranean and Red Sea, and the Law of the Land, as was lived by herding and farming peoples who would be pushed further inland by claimants of the coasts.[961] The Old Kingdom of Egypt, displacing the Naqada culture—itself derived from the Painted Pottery People—, may also have arisen as an effect of the Austronesian expansion, the pyramids having been built under the newfound influence of the chiefly authorities, having progressed into kingship. Michael Bradley, however, distinguishes the Egyptian civilization as being Atlantean, and so representative of the *Homo sapiens* project, running counter to that of the Neanderthals.

Fuller points to the important position of Egypt, as a point of reception of trade from Asia, especially by way of the Red Sea, which was not too far away from the Nile, and thereby the Mediterranean. Where they could, suggests Fuller, trade routes would make use of waterways, as through the Azov, Caspian, and Black seas and through the various riverways. He connects the Red Sea and the Land of Punt on the Horn of Africa generally with Phoenician control, considering the Phoenicians a world-going seafaring people, replacing Minoan dominance. Especially important to the land-going exchange between Asia and Europe was the Khyber Pass. [962]

The Egyptians, known for their giant *pyramids*— meaning "fire in the middle," like a volcano—, the Sphynx, and their elaborate mummies, left a major impact on Western society, such that the story of Western Civilization often begins with the Ancient Egyptians. A people very concerned with the afterlife, perhaps the most important mark that the Egyptians had left on us is their teleological thinking, which had been passed on to the Ancient Greeks, Artistotle himself, perhaps the most major exponent of teleology, having been said to have visited Egypt to learn her mysteries there.[963] Egypt maintained a massive cult of the dead, built on ancestor worship and notions of heaven. It was her

---

[959] Cain is like the Big Men or Tonowi, Seth like the Chieftains.

[960] Much like the Denisovans with their fancy jade rings, the chieftains of proto-Sino-Tibetan society were obsessed with jade, and in particular jade discs that represented the sky, the center of the disc representing the Pole Star, used to accompany an astrological mythos of the proto-Sino-Tibetan people

[961] Admiralty Law is the private or domestic variant of the Law of the Sea, which is its public variant. Admiralty Law deals with domestic or national laws and the Conflict of Laws between them, also called *private international law*. Law of the Sea governs trading and salvaging rights and obligations, matters of collisions and insurance, and etc. as a matter of customary international law. Unlike the Law of the Sea, established by way of Phoenicians, Vikings, and others, and especially formalized after the Treaty of Westphalia and the influence of Grotius, the Law of the Land— established perhaps by Ancient Israelites or Hittites, or another ancient people, and often attributed to the Saxons— referred to all of the laws in force in a given country, and took the form of common law and, after the creation of city-states and especially after the establishment of the Roman Empire, to statute law such as civil and criminal law, as well as to Catholic canon law during the Middle Ages, personal law during the reign of Ottomans and others, and contract law. The *Magna Carta* declares that no judgement will be made against a free man except by the Law of the Land, discluding the Law of the Sea. The "Northwest Ordinance" established under Congress as established by the *Articles of Confederation* emulates the language of the *Magna Carta*. The *Constitution*, replacing the *Articles of Confederation*, declared itself the "Supreme Law of the Land."

[962] See Fuller

[963] This was not uncommon, as many philosophers from Pythagoras to Plato had done the same.

concerns with the afterlife, with the final judgement, and with teleology that led to the greatness of the Egyptian Empire, an empire built on forethought and consideration toward the future, as well as with justice and judgement by the gods. This sort of teleological thinking, mixed with ancestor worship, would contribute greatly to what would become *theology*, the study of divinity and the divine, or "the logic" or *Logos*, "of God."

Egypt's would also be among the first of the monotheist faiths, particularly under the influence of the heretical Pharaoh Akhenatan, and his worship of the sun god, Aten. Hebrews and Gnostics also have an important place for Egypt in their stories, for the cults of Set or Seth,[964] the son born to Adam and Eve after Abel's having been slain and Cain's having been banished, have their home in Egypt, Joseph had spent his time after his having been sold in Egypt, and it was from Egypt that Moses freed his captured people, for instance. Early Christianity would also be home in Egypt, contributing to much of the direction the early Church would take. Among its most important philosophical contributions was Hermeticism, as was said to have been produced by the god Thoth in *The Emerald Tablets*, attributed also to the "Thrice Great" Hermes, or Hermes Trismegistus, understood to have punished Seth for his misdeeds. Hermeticism involves the belief in different planes of existence, with polarity and vibration being important aspects. Some have derived from it what appears to have been some kind of knowledge of electricity, perhaps contributing to some use, perhaps such as in the form of the *Bagdadh batteries*, clay jars with copper that, according to Wilhelm Konig, were filled with grape vinegar, allowing the user to do such things as plate with gold, using the electricity derived therefrom. Fringe archaeologists are on the lookout for a more impressive use of electricity from the Ancient Egyptians, suggesting at times that the pyramids themselves may have been some sort of power plant, others suggesting they were a means of listening to the *harmony of the spheres*, or the sounds of the planets. Indeed, much of ancient architecture, including in Ancient Egypt, seems to have been of astrological or astrotheological importance. The Great Pyramids of Giza, for instance, have been shown to have been built in an alignment with Orion's Belt.

Ancient Egyptians such as Ptah Hotep had long taught wisdom. Ptah Hotep recommended conducting oneself with behavior so straight that it could be "measured with a plumb-line," something we might hear from Benjamin Tucker millennia later. Hotep taught the importance of listening to others, that evil cannot win in the long run, to be monogamous, and that man is not born wise. Some of these ideas are likely to have influenced the Greek philosopher Socrates to his famous method of inquiry, the *Socratic method*, and perhaps even what would become Christianity by way of Atenism and Hermeticism.

Despite what wholesome wisdom and rational insights into spirituality may have existed, Jiang Xuequin has suggested the strong possibility that the pharaohs of Ancient Egypt were controlled by the Egyptian priesthood through abuse and mind control. He suggests that the Ancient Egyptian priesthood had figured out how to induce psychological splitting in the Pharaoh and, through the use of certain sensory triggers such as scents, could induce preferred reactions from the Pharaoh as an automaton under their influence and control. According to Xuequin, the idiosyncratic myths of the Ancient Egyptians only make sense when considered as instructions for such things as how to take someone to the point of near or temporary death through Satanic abuse, so as to achieve ends such as these.

[964] Some associate Set or Seth with Saturn or Satan, and with worship on Saturday by extension, though it was through Seth that the Hebrew people came to be. William B. Greene said, in "Cain and Abel," that Cain and Seth stand together over the dead body of Abel, finding power in working together. Cain plays something of the usurper, while Seth stands as an official of redistribution, as Greene sees it. Working together, Seth legitimizes Cain's plunder, and can share in the killings. This is essentially a metaphor for the Right and Left wings of politics, of Cain and Seth, Cain the usurper and Seth the redistributor.

Xuequin seems to believe that this practice has since become widespread and basically normalized among the elites of the ruling class, as his series suggests on numerous occasions.[965]

Buckminster Fuller points out that the world saw a long chain of power-shifting and succession, whereby horse-mounted warlords from Asia conquered shepherd kings,[966] those warlords who built citadels conquered the others, and then those citadels that could be supplied by and supply their troops by water passes conquered the others. Fuller also points out that the trade routes of the time included land-going caravanning routes along the Silk Road and water-going routes along the coasts of the Indian Ocean, the Red Sea, and the Mediterranean.

Before the Phoenicians, Minoans, and Greeks besieged it, Fuller says, the city of Troy, guarded by its stone walls, had been the main world or European power, owing to its control of the meeting point of land-going caravanning and water-going shipping centers, where the land hands off to the sea and vice-versa. Fuller says that "Ancient Troy was a powerful city-state and commanded much of the overland traffic between Asia and Europe [...] The fall of Troy saw the supremacy over human affairs pass from the masters of the overland, Asia-to-Europe, inland-sea ferrying and caravanning lines of supply to the masters of the high-seas, maritime lines of supply." These would include the Phoenician, Greek, and then the Roman commands of the Mediterranean. But, "unfortified Venice became in due course the headquarters of the masters of the Mediterranean lines of supply."[967] Carrol Quigley similarly says,

> The Iron Age invaders [...] drove fleeing before them a mixed group of earlier inhabitants [...] including Achaeans, Etruscans (Trojans), Cretans, some Dorians, and various dimly known peoples of the Anatolian shore. This mixed group crossed the Mediterranean and became the unsuccessful Iron Age invaders of Egypt.[968]

Quigley suggests that this group, which included the Trojans, had "Viking-like ships," and suggests that the Etruscans may have been the Trojans themselves, relocated, and that the Sicilians and Sardinians may have gotten their names from the larger group of Sea Peoples. Troy may have been in Wilusa or perhaps Hisarlik of Troad, Anatolia, controlling the trade into and out of the Black Sea. Famous for starting discord with the Spartans over Helen of Sparta,[969] the Trojans sparked the Trojan War with the Greeks. Buckminster Fuller holds that these Trojans had been conquered by a mixed bunch of Phoenicians, Greeks, and Minoans. Fuller, however, connects the Viking-style ships to the Phoenicians. It does appear, when looking at the artistic depictions of the various peoples, that the Phoenician vessels have the most in common with the Vikings, including the use of red-and-white striped sails.[970] What appears to be happening is that the Mediterranean peoples in general could be said to have "Viking-like ships" to varying extents, but that the Phoenicians are the most likely to be tied to the actual Vikings.[971]

Canaanite peoples, like the Phoenicians and Hebrews, were practitioners of *cleromancy*,[972] the use of divination to interpret the will of God, as is also used in fortune-telling, as with a "magic eight ball."

---

[965] See Xuequin in particular, as well as Xuequin's YouTube channels, including Learn with Prof Jiang, Prof Jiang Uncut, and Predictive History, for much in this regard

[966] The Hyksos were known as *Shepherd Kings*

[967] Fuller, xx

[968] Quigley, 205

[969] Interestingly, Jews and Spartans saw themselves as related; Helen of Sparta may have been a Jew

[970] Which likely contributed toward the stripes on the East India Tea Company and later United States flags. The Committee of 300, which ran the company, is still a major influence today, as John Coleman points out.

[971] Vikings were a Nordid people whose ancestry came from the Indo-Scythians, whose ruling class had been Canaanites, as explored elsewhere

[972] Cleromancy was similarly practiced by the Germans. Tactitus says that

Divination, such as rolling dice—early on, in the form of sheep's knuckles—, consulting the I-Ching, Tarot, or other means— has long been used as a means of selecting religious and even political rulers, of making life decisions, assigning guilt, and much else. Astrology, coming from Babylon, would become a very important tool for divination, whereby decisions were understood to be "written in the stars," a statement of God's omnipotent control of human affairs. In such practices, properly understood, God is seen as the ultimate adjudicator, the final judge of all human affairs. Appeals to God, in times of inter-human conflict, might be posed in the form of warfare, with the victor understood to have been chosen by way of divine providence. Such violence could be skipped by way of submission to voluntary practices of divination, such as by agreeing to the gamble involved in the roll of the dice. Astrology added a less chancy though also potentially impartial system of selection by divination, except for allowing prophets to have some say in the matters of the divination, as by selecting wherefrom a ruler may be drawn and when. Another important form of divination, related to the rolling of sheep's knuckles (throwing dice), and one which lent itself more toward a democratic form of social organization, was selection by lot or lottery, called *sortition*. Typically used among aristocrats or, less often, in popular assemblies, lotteries chose officials in a non-arbitray and impartial fashion, ensuring the unlikelihood that seats of power would be monopolized by any given interest group, such as a family, clan, or cult.[973]

The Hebrew Judahites, who would come to be known as *Jews*, had been captured by the Babylonians and taken to Babylon, from where the Jewish *Babylonian Talmud* gets its name. Here the Jews were immersed in many ideas of the Babylonians, including astrology and perhaps also what would come to be known as *name stealing*, or the playing of linguistic tricks, similar to that done by Sophists. However, the Hebrews had arguably come from around that area to begin with, as Abraham was understood to have been born in Ur.

Indians and Iranians

The Indic people had a mostly Australoid substrate upon which an Aryan superstrate was formed from out of proto-Nordid or Pontic and Turanid cultures such as the Yamnayan-influenced, proto-Scythian, Sintashta and Andronovo cultures. This Aryan superstrate would later be followed up by one of a Nordid type, from the Scythians-proper. All of these, overall, had a fair amount of Neanderthal and perhaps Denisovan admixture, not entirely unlike the Semitic peoples, but tending more toward

---

> For divination and casting lots they have the highest possible regard. Their procedure for casting lots is uniform: They break off the branch of a fruit tree and slice into strips; they mark these by certain signs and throw them, as random chance will have it, on to a white cloth. Then a state priest, if the consultation is a public one, or the father of the family, if it is private, prays to the gods and, gazing to the heavens, picks up three separate strips and reads their meaning from the marks scored on them. If the lots forbid an enterprise, there can be no further consultation about it that day; if they allow it, further confirmation by divination is required.

[973] The ancient city of Athens, for instance, selected its officials by way of lottery, though it was directly-democratic, with important matters taken up by an assembly of aristocrats. Eventually, sortition— which would not always successfully qualm threats, especially when a bigger party could take power by force— as a means of selecting rulers and making decisions, would be replaced by majority-rule, the conscious selection of rulers, or making of decisions, by the casting of votes. This, which assumed that a majority would typically win out in a conflict, was a secularizing event that assumed that the selection did not have to occur either by warfare or by way of a priest in charge of divination, acting as a medium between the people and God, but could occur by participants in the assembly directly choosing who they thought best-suited—from among eligible candidates— for the position. Majority-rule has more recently, perhaps since the time of Nicholas of Cusa, been challenged itself by various forms of consensus or range-voting, such as the Borda count or Condorcet method.

dolichocephaly, as is the norm for Neanderthal, and coming from out Scandinavian and Siberian refuge zones rather than simply from holdouts in the Middle East. Siberianization would have occurred by way of influences such as the Andronovo and Sintashta.

The superstrate to Hinduism, the native Aryan religion of India and Pakistan, grew out of an earlier religion, called by some the *Vedic religion* (much like Yazdanism) which had been carried to India from Aryan raiders ultimately sourced in the Samara or Yamnaya and related cultures. The substrate to Hinduism is sourced more natively among the Dravidian peoples. Hinduism typically, but not always, involves the belief in an eternal cosmic cycle that takes place within the waking and sleeping moments of Brahman—the Universe, or God—, and with it the cycle of *samsara*, or of death, birth, and reincarnation. One's place in the the world, one's lot in life, is a result of one's *karma*, or moral behavior, in one's previous lives. By living a pure life, as through ethics and good works, and perhaps by way of proper esoteric training or rituals, one can achieve *moksha*, or liberation from the cycle of death and rebirth. A popular alternative to Brahman is Shiva. *Shaivism* is a very popular Hindu tradition involving worship of Shiva. Other popular gods, sometimes worshipped in a monotheistic fashion, include Vishnu,[974] Devi, Ganesha, and Surya. Hinduism involves the recognition of many gods, and includes within itself polytheistic, monotheistic, and atheistic traditions, being more a collection of local competing traditions that have largely been brought together by the Aryan conquerors and their Vedic superstrate to the Hindu tradition. Traditions such as Hari Krishna are considerably close to Christianity in some of their beliefs, with some suggesting that, in fact, Krishna and Christ are the same person. Hinduism has also been associated with the caste system, whereby different tribal groups, typically arranged around both ethnicity and traditional trades, are held to inherited positions in society, which range from the priests or Brahmins (in Celtic society, Brehons) and the royals or Raja, at the top, to the untouchables, or Dalits, at the bottom, and everyone else, such as the Jats, falling variously inbetween as warriors, merchants, trades people, peasants, and etc. As a result of Hinduism's harsh and restrictive caste system, two tendencies were produced, the *Nastika* and *Astika*. The *Astika* were the orthodox believers, while the *Nastika* were the heretical and heterodox non-believers and those with interpretations counter to those of the priestly classes. Buddhism, named after its founder the Buddha, was a particularly influential form of *Nastika*, had taught against the caste system, that life was suffering induced by attachment to desired outcomes, and that by letting go of attachment we can cease to suffer, using meditation as the vehicle for achieving this. The ultimate goal in Buddhism is the attainment of *Nirvana*, the cessation of existence and so also the suffering which results from existing and desiring.

While the cultures of India may have been widespread long before, the Mauryan Empire represents, perhaps, the first real, large, formally-organized empire in India. The Mauryan people possibly had some relation to the Atlanteans of Mauritania and Morocco, and possibly even the Maori and other "pseudo-Mediterraneans" of Oceania. The Mauraya were derived from the Moriya clan of the Shakya (Saka), as did Chandragupta, founder of the Mauryan Empire. The Mauryan Empire was home to the famed Ashoka, a Buddhist ruler who had declared himself to be the *chakravarti* or "Ruler of the Universe," developing the concept of the *divine right of kings*. The "Ruler of the Universe," upon ascension, was understood to signal the *Maitreya*, or future Buddha, having some relation to the concept of *Messiah* in other cultures. Similar in some respects to the concept of Christ and its

974 Of note, the Vishnu *parana* is pantheistic, and some of the Saka had taken to Vishnuism, as can be found in Saka coinage, *Saka* also being one of the names given to the seven continents in the texts. Buddha was incorporated into Vishnu-worship as an avatar of Vishnu. A prior avatar was Krishna, whom people such as P.N. Oak and others considered to have been a potential origin point for Christianity.

relationship to the *Logos*, the Ruler of the Universe was was associated with having the "Wheel of Dharma" move through him. The fall of the Mauryan Empire would leave the Khyber Pass unguarded.

From out of the Himalayas and Tibet, religion and statism would spread. Religiosity would follow Westward down the Hindu Kush Mountains, through the Zagros, and up through Transcaucasia (and the Ural Mountains dividing the continents of Eurasia) and up into the Alpines of Europe. Alpinid peasants, living in the Alpine Zone of Europe, would become especially vulnerable among Europeans to superstition, owing to their farming lifestyle, particularly affected by havocs such as droughts and floods. This superstition would be played on by later Canaanite religion for purposes of feudal control (feudalism having spread from South Asia), enslaving the peasants in their own stupefaction and directing them through suggestion. This enslavement by way of steering of the mind would be known as *guberne mentis*, "government," which always worked with the blessing of or declared itself to be *religare*, "religion." Indo-European and other languages would likely emerge as a result of Dene-Daic languages— which contain the Sino-Caucasian and Sino-Tibetan— traveling through the mountains and mixing with Turanian languages, or perhaps Kartvellian, if not both.

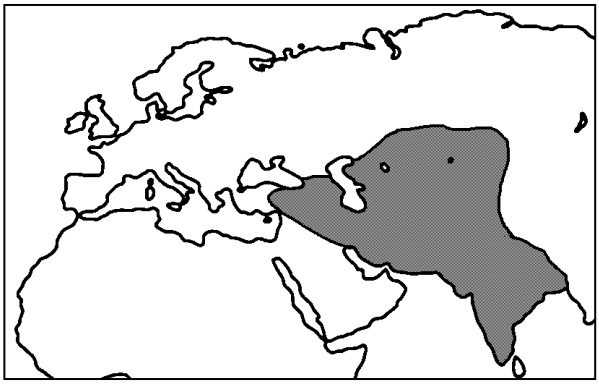
The Iranic people's substrate came largely from the Zagros and its superstrate largely from the Caucasus and the Pontic Steppe, such as from the Sintashta, Andronovo, and the Oxus and Yaz cultures[975] that started to become sedentary and feudalistic. As Christopher Beckwith tells us, in *Empires of the Silk Road*, "Large areas of Siberia, deep into Mongolia, were anthropologically Europoid in High Antiquity."[976] This is where the Iranic superstrate comes from. Iranics are especially associated today with a Georgian (as opposed to Armenian[977]) Caucasoid sort of phenotype, which is also common among Saxons and Samaritans, having been associated also with later migtations of the Nordid Scythians. They eventually established the Median Kingdom and the Parthian Empire, becoming known later, after succumbing to the also-Iranic Achaemenid Empire, as the *Persians*.[978] *Iranian* is basically the same as *Aryan* or *Alan*. Tats are an example of Parthi people in the Caucasus. Mountain Jews, perhaps a relative of the Tats,[979] speak the Tat language, along with some Armenians.[980] The Indian and Iranian peoples collectively speak a branch of the Indo-European languages called the *Indo-Iranian* or *Indo-Aryan* languages, which range from North India and Nepal up to Turan and over to Anatolia. Today, Iranic languages are spoken in Georgia, Iran, Afghanistan, Pakistan, and Tajikstan, naturally having close affinities also with the Indic languages centered in India, also to be Aryan languages.

A remnant of Gutian and Yaz religion, perhaps, and home in the Zagros Mountains and Iran more generally is Yazdanism. Yazdani religion is essentially pantheistic, believing a somewhat transcendent God to encompass the entire Universe. The world, to the Yazdani, is internal and external, invisible and visible, transcendent and immanent. It has been compared to the ancient Mesopotamian religion involving the Anunnaki, favorites of "ancient astronaut" charlatans, aspects of the god Anu, due to its emanationism involving seven emanations. The Yazidis hold Melek Taus, symbolized by a giant peacock, to be the lord of the planet, an entity suggested by outsiders to be Satan. Like Hinduism, Yazidis believe in reincarnation, and they believe that important figures as manifestations of the Divine incarnate to teach the way.

---

975 Sometimes considered proto-Saka. The Yaz culture practiced proto-feudalism in Central Asia from citadels.
976 Beckwith, 58 (footnote 4)
977 Georgian Caucasoids tend to have softer features, including smaller noses, though Armenid noses may also be found among Iranids (and Afghanids)
978 The Saka served the Persians (Sassanians) as cavalrymen, perhaps developing into cataphracts in Persia before becoming Saxons of Europe, the Sassanians being their cousins
979 Tats are dolichocephalic while Mountain Jews are brachycephalic
980 *Tat* is a rendition of *Jat*

Like Hinduism, Mazdaism had grown from out of native Aryan religion, such as that revived by Rodnovery or Assianism. Ahura Mazda was the "Lord of Wisdom" as well as Being itelf and, similar to neo-Platonism and its "Source," was also goodness itself. Mazdaism would develop into Zoroastrianism and Zurvanism, and later into Mazdakism. Zoroastrianism, the largest of them all, and initiated by the prophet-philosopher Zoroaster, had posed that Ahura Mazda was the good god, and ultimately the god who wins in the end, but that another god, Angra Mainyu, who was an evil god, was in a cosmic battle with Ahura Mazda. This presented a kind of modal duality wherein two gods were set in a duel, but one which ultimately resolved in favor of the one, good god, Ahura Mazda,[981] which, as with the Source of neo-Platonic philosopher Plotinus, is Being itself. Like the Ancient Egyptan religions, Zoroastrianism believed in a judgement after death, and was monotheistic, becoming a great influence on both Abrahamic religions and Hellenistic monotheism, as well as on Hinduism. Zoroastrianism would be especially influential among the Persians, but its holy texts are called *Gathas*, presumably of some relation to the Goths. Zurvanism would split with Zoroastrianism in, instead, holding that the god Zurvan, a neutral and unbiased god, was the ultimate, the One, and that he had created the twins Ahura Mazda and Angra Mainyu. Elements of the Mazdaic religions, which are heavy on astrology, may ultimately be sourced in Chaldea or Babylon, as with the Sabians who are also said to carry on the original tradition of astrology. There are similarities between Zoroastrianism and the Ancient Egyptian religion of Atenism, started by the monotheist reformer Akhenaten. Otherwise, Egyptian religion is perhaps more relatable to Vedic or Hindu and especially Canaanite and Germanic polytheism. However, one important characteristic about Egyptian religion cannot go without being stated, and that is its proclivity for teleology, which tended to add a linear component to their beliefs that was connected to long-term thinking. The Egyptians were very much concerned with an afterlife, and they believed that one's destiny or fate was dependent upon how justly one lived. This would become an important and defining feature of Western thought, and would contribute to natural philosophy in the hands of Greeks such as Pythagoras, Socrates, Plato, and especially Aristotle. Teleology can also be found in Babylonian and other Aryan traditions.

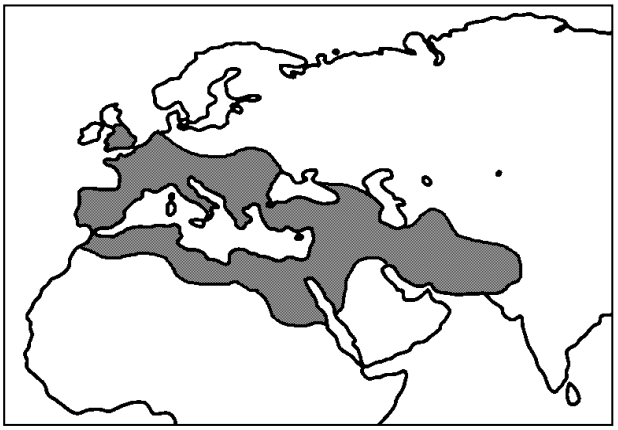


General combined range of Indians and Iranians

Greeks and Romans

The Greeks and Romans had largely been Mediterranoid peoples with a superstrate of proto-Nordic laid atop of them by waves of Yamnayan- and possibly Hittite-sourced peoples, bringing the Indo-European languages of Greek and Latin to the North Mediterranean coasts, and laying them atop the Old European Cro-Magnoid and Mediterranoid cultures such as the Etruscans and Minoans and Basques.

[981] *Ahura Mazda* means "Lord of Wisdom"



General combined range of Greeks and Romans

The Greeks are known to have been the home of democracy, especially by way of Ancient Athens. Inhabited by the Cyclopians since long before, it would become the home of the Mycenaen civilization, the proto-Greeks. For a long time, the Athenians had been ruled by kings and a land-owning aristocracy. Draco, whose name gives us *draconian*, established harsh policies in Athens, before Solon abolished debt-slavery in Athens and established the first known directly-democratic city-state. Solon broke up many large landed estates and greatly freed commerce for the people of Athens. The market in Athens was known as an *agora*, and its democratic assemblies were called e*cclesia*. Athenian democracy would be corrupted by the domination of Peistratos the tyrant, a populist leader who monopolized control of political offices for him and his family. Perhaps something of a proto-"sewer socialist," he went about constructing aqueducts. Some elements of the democracy were preserved even after its corruption, with offices filled by lottery rather than election, excluding those offices of the generals.

The Greeks and Romans are known for their secular societies, too, perhaps the first large secular societies in history. Greek and Roman secularism was likely initiated by Sanchuniathon, a Phoenician philosopher who exposed the symbolic nature of Phoenician religion, pointing to natural phenomena as the real source of knowledge. After the Phoenician philosopher Sanchuniathon, who had declared religion to involve secret metaphors about Nature, had exposed the metaphorical nature of the gods, the Greeks seem to have gone about a secularizing revolution. They would initiate the modern West with their secularizing natural philosophies, deflecting, though not entirely, the onslaught of Eastern religion in the hands of Canaanite sophists and mythologists. The Greeks seem to have run with the insights of Sanchuniathon, producing a secular society that created secular philosophy, philosophy centered not around supernatural religion, but around Nature.

Some of the Greek and Roman mystery schools, but especially the schools of philosophy, would play a role in exposing religion for what it is, a human interpretation of Nature. The Carravaka, an atheist sect in India, may have preceded Greek secularism, but can't be said to have established a secular civilization the way that the Greeks and later Romans can be said to. Still, sophistry and mythology continued for some time, and polytheism and other fictions were difficult to give up, having been so ingrained in the culture. One author, in "Mystery Religions and Christianity," holds that "Greek life was characterized by such things as democratic institutions, seafaring, gymnasium and athletic games, theatre, and philosophy."[982] The secular democratic and republican societies of Greece and Rome would produce the staples of ancient Western philosophy, which covered many schools and renditions of them. Philsophy is, itself, heresy, especially if philosophy is the knowledge of good and evil.

Early philosophers from Thales, Pythagoras, and Heraclitus to Xenophanes, Parmenides, and Empedocles tended toward a pantheistic view of the world, expressed in different ways. This had come itself from the older sages, *sage* meaning *wise man* or *good person* (or what would become *saints*), who had developed a kind of pantheism themselves. The *Socratic Revolution*, which would see the moral philosophy of Socrates—the idea that it is better to suffer harm than to inflict it on another— take hold

[982] N/A4

in Plato, Aristotle, and others, would greatly impact the peripatetics, Platonists and the later neo-Platonists, Stoics, and others to follow from the Graeco-Roman world wherein Christianity would be developed. The Socratic Revolution introduced a focus on teleology, morality, and idealism, likely sourced from Egyptian notions relating to the afterlife and how to prepare oneself for it, but perhaps also from the Hebrew prophet Jeremiah. Socrates prescribed living an examined life.

Greek society would reach its zenith under the influence of Alexander the Great, a student of Aristotle, who had attempted to conquer the entire world. In the process, Greek culture, including philosophy, was spread widely, a process called *Hellenization*, named after the Greek godess Helen. Hans Leisegang, in "The Mystery of the Serpent," as found in Joseph Campbell's *The Mysteries*, implies the pantheistic foundations of Hellenistic religion when he speaks of "the era of Hellenistic universal religion, that 'solar pantheism' which [Paul] Wendland [...] refers to as the terminal form of the history of ancient religions."[983] In connection with this, Leisengang mentions the Mithraics, Gnostic Christians, and Stoics, saying that with "time this solar pantheism became enriched with other ideas from various sources, and Philo made it into a universal mystery of light, in terms of which he even reinterpreted the *Old Testament*."[984] Indeed, "the solar pantheism of late antiquity [...] made Yahweh, like the leading gods of various other religions, a sun god."[985] This pantheism was symbolized by the *great serpent*, which sheds its skin and is reborn. The author also connects the god Pan to this solar pantheism, showing him as depicted in the center of a zodiac.[986]

The Greeks had conquered as far as India, such that it is possible to speak of Indo-Greeks, Greco-Buddhism, and so on. The Indo-Greeks, following Alexander the Great and the philosopher Pyrrho, perhaps already influenced by Buddhism from Greek exchanges with Buddhists on the Silk Road, associated some with the Indo-Scythians and brought back Buddhist sentiments to Greece, leading to a bastardization of Greek pantheism and philosophy (as previously influenced by Egypt, Phoenicia, Israel, and Babylon[987]) as well as to philosophies like Stoicism and Epicureanism. Stoicism, started by the Phoenician Zeno of Citium, would reflect much of the older Indo-European pantheism, but—along with some positive innovations— with the addition of gaslighting oneself about one's emotions, which some have referred to as "self-tyranny," a sort of repression of one's self, an absurdity gained from Buddhism used in efforts of outward manliness so as not to appear emotional to others (which is not "manly"). This became especially fruitful for the Roman military, which could much easier send men who did not complain to war and to enforce unjust laws on their fellow Romans. Epicureanism, on the other hand, was a tendency to atheism or non-theism, suggesting the neutrality of the gods toward one's life, and the benefits of being away from displeasure and of having solace. In a classic defense of common sense, Epicurus had said that "[i]f you argue against all of your sensations, you will then have no criterion to declare any of them false." *Apikorsim* refers to a Jewish heretic, a follower of Epicureanism, named after Epicurus. Only Jews use his name this way, and most Jews today are *apikorsim*. Ultimately, the split between the Stoics and the Epicureans would carry on through much of history, such that this might be considered a sort of foundation or milemarker for the antagonisms between religious and secular efforts of today, such as the two poles of Christian Anglo-Saxon capitalism and secular Jewish communism.[988] The Greek mythographer Euhemerus said that the gods were simply the deified rulers,

[987] Such as Egyptian and Phoenician wisdom, mathematics, and philosophy, Israelite theology (by way of Jeremiah's followers), and Babylonian astrology
[988] Christianity was largely an outgrowth of Stoic beliefs (among others), and the Phoenicians may have become the Angles of the Anglo-Saxons, while Karl Marx was a fan of Epicurus, whose name means so much to Judaism.

founders, and champions of the past, and that their cults were continuations of vanquished political structures, recognizing a cult of Alexander the Great taking place in a similar manner.[989]

The Romans, greatly inspired by the Greeks but also displacing their control of the Mediterranean, would establish, after their own period of kingship as the Roman Kingdom, the Roman Republic. The last king of the Roman Kingdom, Lucius, or "Tarquin the Proud," was expelled from Rome after his son, Sextus, had raped a noblewoman. Her husband successfully organized support from the Senate and the Roman army, who would later abolish the monarchy, declaring instead a *republic*, a government exercised over the public relations of society, as opposed to their private affairs. As Domitius Ulpianus suggested, "Public law is that which concerns the Roman state, private law is concerned with the interests of citizens."[990] The Roman Republic would thenceforth be governed by a double consulship, each having the power to veto the other, something preserved in modern conceptions of *hamarchy*. Tarquin the Proud would conspire to take back the throne.

The Roman Republic would eventually degrade into the Roman Empire, losing its democratic qualities. At first, the Roman Empire pretended to keep up with the republican values of the Roman Republic, under the Precipate Period, but the corruption of the Republic and its having turned into an Empire would become widespread knowledge during the later Dominate Period of the Roman Empire.

The Greek and Roman people were both Indo-Europeans, but they spoke languages from different branches of this larger family tree. Nonetheless, the Greeks and Romans influenced one another so much that it is impossible to separate them fully in terms of culture, historians often speaking of a *Graeco-Roman world* and so on. The Graeco-Romans interacted with the Phoenicians and other Canaanites, too, and the Egyptians, among other Mediterranean Afroasiatic peoples, such that *Graeco-Egyptian* is spoken of as well, or *Graeco-Roman Egypt*. Like the Greeks and the Romans, the Egyptians and the Phoenicians shared much in the way of culture. Despite the differences between the Indo-European and the Semitic languages, their cultural ties are strong enough that the Ancient Greek and Ancient Hebrew script is basically the same, written in reverse.

As with the philosophers, the first true historians would come from out of Ancient Phoenicia, Greece, and Rome. Though following well after Sanchuniathon, Herodotus, a Greek, became the official "father of history" when he compiled historical works, distinct from myths as well as from chronicles or annals. Thucydides was an Athenian historian, more rational and less religious than was Herodotus, and Xenophon was another Greek historian. Roman historians would come to include those such as Polybius, Cato, and Pliny. Along with history internal to their societies, ancient outsiders, such as the Scythians, were described variously by Greek and Roman historians such as Homer,[991] Herodotus, and Pliny the Elder, and since by multitudes of others, today using insights from archaeologists and anthropologists, who study such things as their phenotypes and their material cultures, as well as philologists, who have deduced a great deal about their languages and, when reflecting upon their material culture and environment, about their cultures. Using this information, it is possible to get a much better idea of who these people were and to advance more toward a natural history of humanity,

---

Buddhism would also directly influence the emerging Germanic Anglo-Saxon and Jutish societies, coming from out of peoples such as the Saka and Goths, leading to gods such as Odin.

[989] As a result, *Euhemerism* is the belief that myths are derived from legends

[990] *Huius studdii duæ sunt positiones: publicum et privatum. Publicum ius est, quod statum rei Romanæ spectat, privatum, quod ad singulorum utilitatem; sunt enim quædam publice utila, quædam privatim*

[991] Who said the Scythians were the most just and proud of all people

freed from religion. Pliny's *The Natural History*, after all, was not limited to primarily-physical Earth sciences, like it is today, but was a general encyclopedic compilation of the works of earlier authors.

Despite their having had the titles of *democratic* and *republican* societies, and despite their having had progressive elements, these were nonetheless very class-oriented societies that had no problem making use of slaves. The democracy of Ancient Athens, though direct, was not a popular democracy, but an aristocratic one, in which one could not participate without having been noble-born. The same is true of the Roman Republic. The Patricians, for instance, held much political power in the Roman Republic, having monopolized many important religious positions that granted them automatic influence in the Senate. Some of the Plebeians, typically commoners, had become nobles, or politicians, as well, but overall the Plebeians or "free men" were under the political influence of the Patricians. Eventually, *plebeian* came to be a term to refer to anyone who was not a senator, and who thereby had no political influence.

Slaves, though relatively low in number, were a major part of the Roman Republic and Empire, upon which it was dependent. Pirates were a particularly prevalent source for slaves. Slaves might be brought in from Africa or even from Northern Europe and Eurasia. Greek slaves were seen as especially educated and capable of performing important duties. Spartacus had been a Thracian slave who led an uprising. Roman law, as understood by Gaius, saw slavery as "dominion of another person contrary to nature" as established in customary international law. In other words, it had been a longstanding custom, between different peoples, not to enslave one another, and the Romans were going against this international custom. Of the Roman statesman and Stoic, Seneca, Rudolf Rocker tells us that

> Seneca opposed slavery, and in many of his letters, especially in the nineteenth, reached genuinely socialistic conclusions. Of course we must not neglect to mention that one cannot very well harmonize Seneca's life with his teachings; he had to face in the Senate the accusation that he had accumulated his wealth (he left behind 300,000,000 sesterces, say about 15 million dollars) by wangling legacies and practicing the vilest usury.[992]

Buckminster Fuller says that, "[w]hile historians place prime emphasis on the Roman legions as establishing the power of the Roman Empire, it was in fact the development of ships and the overseas line of supply upon which its power was built— by transporting those legions and keeping them supplied." He connects this sea power of the Romans especially with the inhabitants of Venice, the Venetians,[993] saying that that they were also the Vikings who had gone about conquering the shores of Europe. He says that

> in Italy—in the Northeastern corner—is Venice, the headquarters of the water-people. The Phoenicians— phonetically the Venetians— had their South Mediterranean headquarters in Carthage in Northern Africa. In their Western Mediterranean and Atlantic venturing the Phoenicians became the Veekings. The Phoenicians—Venetians— in their ships voyaged around the whole coast of Italy and sent in their people to each *castello*, one by one. The Venetians had an unlimited line of supply, and the people inside each *castello* did not. The people inside were starved out. Thus, all of the regional masters of the people in Italy hated the Venetians-Phoenicians-Veekings who were able to do this.[994]

Fuller says,

---

[992] Rocker[1]
[993] The first known leader of Venice was named *Ursus*, like the bear
[994] Fuller, 70

> The Romans' overland road to England became obsolete. The Phoenician ships sailing out through Gibraltar into the Atlantic outperformed them. This shifted the battles among the world trade-route power structures from the on-the-land popular visibility to popularly unwitnessed seascape [...] Who the power structures might be became popularly invisible.[995]

The Phoenician-Etruscan, Jewish, and Germanic-derived Vikings would go about establishing trade networks in Northwest Europe, controlling the supply of amber from Jutland and tin from Britain, among other things.

The Romans would eventually combine Hellenism, Canaanite henotheism, and Indo-Persian Mithraism and monotheism and others with grassroots Christianity or Gnosticism, thereby establishing Catholicism. This accompanied the transition from the Roman Republic to the Roman Empire, and together these established increasing State and Church powers. The Empire would fall to the Canaanite and Scythian barbarians of the Iron Age, ushering in the Dark Ages, and the Church would lose its political authority after the destruction of the Roman Empire by barbarians, but would see a re-emergence after the Papal Revolution and the establishment of imperialism and absolutism in the Carolingian and the Holy Roman Empire, wherefrom the Romans would attempt to gain hold again of Western Europe. Greek and Roman natural philosophy, however, would see a revival during the Renaissance, Scientific Revolution, and Enlightenment.

Thracians and Scythians

The *Thracians* were an Indo-European people living in the Balkans North of the Greeks, alongside related peoples sometimes also considered themselves to be Thracian in a wider cultural sense, such as the Dacians and Illyrians. Like others in their area, such as the related Phrygians, the Thracians and Scythians were known for wearing liberty caps, much as can be found worn by characterizations of dwarfs in modern culture, or with conical hats, indeed wizard hats. This is where the wizard hat comes from, in fact.[996] They were a very tribal people, prone to fragmentation, and were described in Homer's *Illiad* as allies of the Trojans in their wars against the Greeks. They were derived from descendents of both the Beaker people and the Samaran or Yamnayan-derived peoples, speaking an Indo-European language. They were known as horsemen and feared warriors who were highly polygamous, having many wives per (happy) Thracian man. *Europe*, as used by the Greeks, originally referred to the territory of the Thracians.[997] Josephus has said that the Thracians had descended from Tiras, becoming the "Thiracians." In *The Bible*, Tiras is named as a son of Japheth.

The *Scythians*, like the Thracians they had, in part at least, come from, are sometimes considered to be a specific people but are more often spoken of in the sense of a cultural complex. This cultural complex includes a wide range of people, including the Cimmerians, Sarmatians, Parthians, Saka, Getae, and many others.

The earlier Aryan and Thracian cultural complexes might be considered to be proto-Celtic and proto-Germanic, perhaps, while the later Scythians, who would establish themselves as an ethnic superstrate and as a ruling class later on, might be considered the source of the Germanic and Celtic ethnicities more properly. All of these people are variously considered to be or have been derived from steppe peoples and tended to share the same sort of pastoralist lifetstyle. Nolan and Lenski remark that "[d]espite the small size of their communities, herding societies are usually fairly large," pointing to the

---

[995] Fuller, 72

[996] Despite their love of liberty, they were involved in much slaving

[997] Thracians were a people who were never united as a whole but which represent more of a loose grouping

fact that pastoralists tend to maintain small clans within large confederations of sometimes mutually-warring people. They suggest also that

> The basic resource in these societies is livestock, and the size of the herd is the measure of a man. Large herds signify not only wealth but also power, for only a strong man or the head of a strong family can defend such vulnerable property against rivals and enemies. Thus, in most of these societies, and especially in the more advanced (i.e., those with horses or camels and herds of larger animals such as cattle), marked social inequality is the rule. Hereditary slavery, for example, is far more common in herding societies than in any other type.[998]

This certainly fits the description of not only Northerly steppe peoples such as the Thracians and Scythians, but also the Southerly lowland peoples such as the Shasu.

The Scythians would get particularly involved in matters along the Silk Road, fighting to open up trade blockages as well as to create them for themselves. As Christopher Beckwith says,

> While the Scythians are best known as fierce warriors, their greatest accomplishment was the development of a trade system, described by Herodotus and other Greek writers, that linked Greece, Persia, and the lands to the East and made the Scythians immensely wealthy [...] [A] majority of their driving force [...] was the need to support their sociopolitical infrastructure, which was built around the person of the ruler and his *comitatus*, or "oath-sworn guard corps," whose members numbered in the thousands. A bustling land-based international commerce developed in Central Eurasia as a result[999]

The *comitatus* that Beckwith mentions, he speaks of as "the most crucial element of the early form of the Central Eurasian Cultural Complex."[1000] He compares it to an oath of blood brotherhood.[1001] It basically consisted of a lord to whom all swore fealty. At this time, there existed the principle of *compurgation*, whereby one could be acquitted by having a group of ten, twelve, or some other customary number of men swear an oath that a criminal act was beyond one's character. This is also known as *oath-helping*, and a comitatus basically consisted of a retinue of oath-helpers, affording the lord legal immunity from crimes. Rather than having been the original situation, it seems to have instead developed as a means of getting around the influence of a Lawspeaker, the civil authority before the rise of such chieftains, lords, and kings. The comitatus system allowed for the development of proto- and eventually full feudal structures, such as those that would especially characterize the Royal Scythians and the various kingships and empires that would spring up.

The Thracians and Scythians are at times associated with strange behaviors. There are myths surrounding transvestites and homosexuals among Thracian and Scythian men, such as Orpheus and the Enarees, perhaps owing to the polygamous and hypergamous nature of Scythian society, factors that have counter-intuitively been suggested to contribute to feminized men.[1002] Some Scythian women were horseriding warriors, called *Amazons*. The *Andropophagoi* were a cannibalistic tribe among the Scythians. Similar to some of the mad gurus and Aghori, they drank from skull cups. Cannibalism was also practiced by others of the Scythians, sometimes for different reasons. The polygamous Messagetae

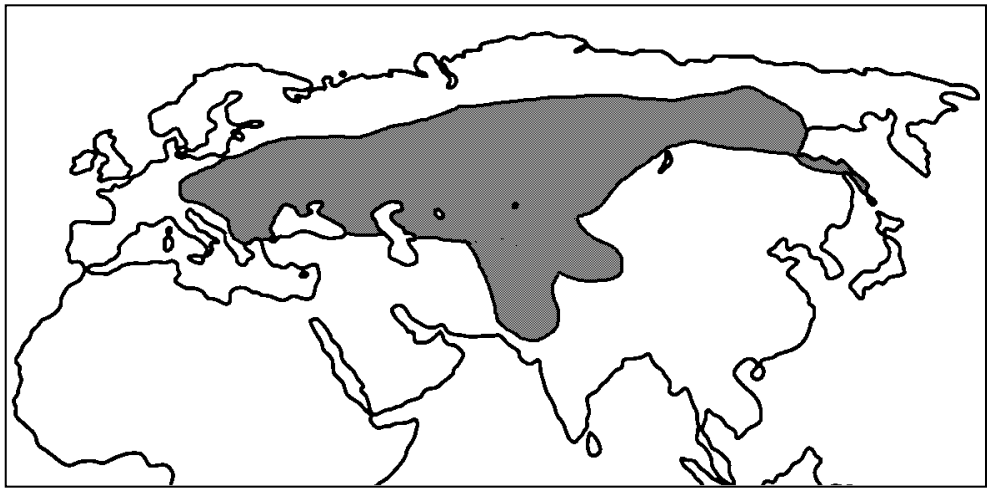
[999] Beckwith, 59
[1000] Beckwith, 12
[1001] Something in common with Native Americans
[1002] And, to be fair, Greece also had its fair share of homosexuals and perhaps some transvestites as well, as with Rome

were said to eat their wives upon their death. Scythians were also known for their habit of *scalping*, removing the hair of fallen enemies as trophies, something they have in common with some of the American Plains Indians, perhaps even deriving it from them, perhaps along with horses (which may have actually been native to the Americas or have come into the Americas before Europeans did[1003]). *Anarya* were pot-smoking, androgynous shamans and soothsayers among the Scythians who were considered to be unmanly and opposed gender conceptions, but who were associated with orgies and antlered headdresses, and were feared for their powers. They may have been sexually impotent and played the role of the "bottom" in sexual encounters with more masculine men.[1004]

Like the Yamnaya, whose Ural-Altaic component likely came from the East, the Scythians are also thought to have extended their culture in the East before moving Westward.



General combined range of Thracians and Scythians
(excepting derivative Celts, Germans, and Iranians)

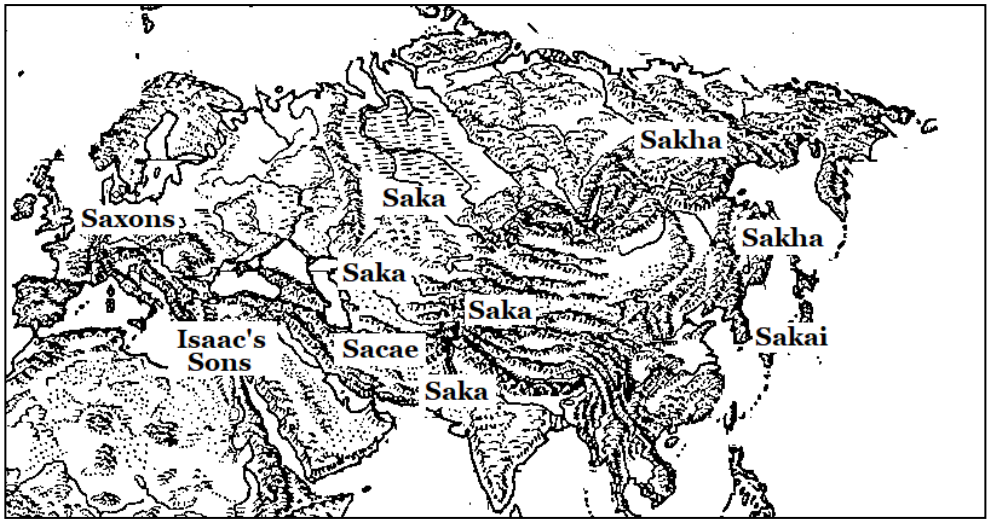
Some of the Scythians, such as the Saka (Saxons) or Shakya, were apparently derived from or had converged with the Andronovo culture, suggesting that these Israelites had come back to visit what may have been a Borean or Hyperborean homeland to at least one component of their genetic heritage, some possibly making it and staying there, as the Sakha,[1005] who live in Yakutsk, before making their way back toward Sumeria again, where they would establish the Yaz culture.

The Yaz culture is considered to be counted among the early Scythians, perhaps especially the Saka and Alans, sometimes being considered to have been proto-Saka or proto-Alan, though certainly also of relation to the Sarmatians, likely being derived from the Oxus cultural complex, but more particularly a Andronovan, Sumerian, or Samaritan component of it. They had kurgan burials, citadels, and keeps in castles with mottes. They are also associated with early practices of irrigation, having been responsible for early sedentarization of Aryan or early Scythian cultures, which would make their way West into Europe. There is also a Sakarya River that is beneath the Black Sea in Anatolia/Phrygia, near Troy, perhaps representing another important Saka location for control of trade.

The Scythians are associated with proto-Zoroastrian beliefs similar to Yazdanism and Yazidism, which are carried on by the Iranic Yazidis, Kurds, and, as Ishik Alevism, among Turks. The Saka, especially

[1003] As was suggested in a paper by William Timothy Treal Taylor and a large number of compatriots in "Early Dispersal of Domestic Horses into the Great Plains and Northern Rockies"
[1004] Androgyny and transvestism was also common among the followers of Astarte
[1005] The religion of the Sakha is known as *Aiyy Faith*, a derivative of Tengrism. The sages are called *Olonkho*.

after having been driven by the Yuezhi (Goths, Jews) from the Eastern steppes of Sogdia and Bactria, went back to Northwest India, becoming the Indo-Scythians. This suggests, perhaps, that the Saka, chased from their home in Israel, were making a perennial trip back through various homelands, one at the old polar region and others, after retreating from the Yuezhi, along the old equator (which they would then traverse along in the form of the Jat Belt).



General range of the Saka excluding plausible excursions into Africa

In India, as the Indo-Scythians, the Shakya established an oligarchic republic[1006] and established Buddhism. Some of the Indo-Scythians had fought with the Indo-Greeks in the army of Alexander the Great, the Greek conqueror of Persia (Achaemenids), who spread Hellenism and secular philosophy across Eurasia, leading to views such as Hellenistic Judaism and Greco-Buddhism. Alexander's mission of breaking up Persian control of the Silk Road was a success, leading to the Macedonian and then Seleucid Empires, both Greek. The Shakya took Indian influence back up to Europe, especially to Germany and Scandinavia, perhaps following the pilgrimage of a sun-worshipping religion that directs them toward the Northern Lights and the arctic circle in order to see that the globe is round, something learned from mysteries from when the axe people had migrated around the Earth along the old equator that is followed by the Jat Belt. Indo-Saka gave sermons in the form of *kathas*.

Gautama Buddha had been a proto-Germanic or Indo-Scythian prophet, his name often spelled *Gotama* and being a reference to the Goths, a Germanic people. The Goths had found their way into the East, where they would become known as *Ostrogoths*, "Goths of the East." His stories from his past lives are preserved in the *Jataka*[1007] tales. Another name, or perhaps a title, of Buddha, perhaps even more appropriate, was *Shakya-Muni*, "Sage of the Shakyas" (another name for the Saka). Buddha had been a Saka,[1008] a Shakya, a Saxon. There is some suggestion, also, that the early Shakya were of relation to the Munda people of India, who speak an Austroasiatic language, as in Southeast Asia. Indeed, the Shakya were a people who strongly opposed the caste system, especially as it related to the Dalits, or

[1006] The *Mahabarata* speaks of factions in the *gana-sanghas*, or aristocratic republics, as being dual and functioning similar to the two-party system of today. The *Vajjika League* was a large confederation of republics during the time of the Sakya Republic but larger.

[1007] Notice *Jat*

[1008] Scholars such as Michael Witzel, Christopher I Beckwith, and Jayarava Attwood have argued in favor of Scythian origins for the Shakya

untouchables, of which the Munda[1009] may have been, and as inherited by their ancestors.[1010] While the idea that Buddha was a Goth or a Saxon may sound strange, what is even stranger is that the Vikings were practicing Buddhists, with their god Odin being a manifestation of Wutan, Wotan, Bodan, Buda, Budha, Buddha, or etc. Budha was the Hindu deity of the planet Mercury, something that would later be amalgamated with gods representing Venus in the Mediterranean, such as Hermes, Thoth, or Lucifer, sometimes also associated with Mercury.[1011] After searching for inner enlightenment, it is said, the Norse Odin hung himself on the "World Tree," and after nine days and nights received the gift of communication, of the runes. Some have claimed that Jesus, too, had been a Buddhist or had great influences from Buddhism, perhaps in particular those who trace him through to the Therapeuts.

The Indo-Scythians— after the governor of Sakastan, Gondophores, declared himself the "King of Kings" in rebellion against the Surenese Parthian landlords— had been followed into India by the Indo-Parthians, who would take territory from the Indo-Greeks and the Indo-Scythians in the establishment of the Indo-Parthian Kingdom. The Parthians, who would eventually become the Persians,[1012] had grown, in part, from the Pani, who had conquered the region of Parthia. Like other steppe peoples, such as the Saka, they had come from the Scythians, perhaps more specifically from the Dacians, and were part of the Dahae Confederation that controlled trade routes on the Silk Road. The Parthians, who may have descended from the Levites, had become Zoroastrian *magi*, or "magicians." Three of these Levite priests had apparently followed astrological signs to a site in Bethlehem, where Jesus Christ was to be born. According to Steven M. Collins, in "Parthia: The Forgotten Ancient Superpower and Its Role in Biblical History," "the Magi were powerful members of the Parthian bicameral body that elected Parthian monarchs and wielded great influence within the empire." He says, "[w]hen the Magi were led by God to pay homage to the young Jesus, they doubtlessly learned that Joseph, Mary, and Jesus," as Arascids, "were all related to the Parthian dynasty," and so "both Joseph and Jesus were potential claimants to the throne of the Parthian Empire!"[1013] It is for this reason, suggests Collins, that Herod, the Roman King of Judea, appointed "King of the Jews," was worried about his throne, and had the male babies of Bethlehem put to death. There had almost been a conflict between the Romans and Parthians as a result; the Parthians had previously ruled over Palestine and the Romans' claim on it was rather fresh. When Jesus was crucified his cross had a sign placed on it declaring him the King of the Jews.

In China, the Tocharians, who are depicted with large noses, were likely Indo-Europeans who had composed the most Easterly wing of the Celto-Thracians,[1014] and were known as the *Yuezhi*, which some have translated as *Goths* or *Jews*.[1015] *Yuezhi* refers to peoples living in places as diverse as Tibet, China,

---

[1009] The Munda language is related to the Khmer language in Cambodia, and may date back to a period when the equator ran through Angkhor Wat, which came be controlled, probably reclaimed, by the Khmer Rouge, an Austroasiatic people

[1010] The Austroasiatic languages are understood to have had an influence on Indo-Aryan languages, perhaps suggesting a connection from very long ago, when the Jat Belt was the Movius Line, followed by migrations of Australoids, potentially mixed with little people like Java Man, *Homo floresiensis*, or etc. of the Malay Peninsula and Indonesian archipelago, potentially though not necessarily at a time when it may have been *Sunda*, a larger peninsula. In this way, the Saka, a people following the footsteps of their ancestors, may have recognized the Munda as one of their own, taking their influence with them back up the Jat Belt.

[1011] Lucifer, for instance, is Venus by virtue of being the Morning Star and possibly in connection with Ishtar, but is Mercury in connection to Lugh

[1012] And possibly the Portuguese

[1013] Collins[2]

[1014] Their mummies were found wearing tartans

[1015] W.B. Henning, for instance, suggested that various kings had names resembling the Tocharian language, a branch of Indo-European spoken in the Tarim Basin, pointing out also the similarity of the name *Guti* to *Kuci*, a

Qianghai, and the Tarim Basin, and is often applied to non-Mongoloid peoples inhabiting East Asia. Often living to the Northeast of Qin China, some of the Yuezhi had joined the Qiang people of Qianghai. But they are best known from their home in the Tarim Basin, from which they had apparently traded jade to the local Chinese in return for silk, which they hocked to their neighbors in the West, an early example of trade along the Silk Road. They were also traders of slaves, and may have been Moon-worshippers. Associated also with blacksmithing, they may have descended from Gutians of the Zagros Mountains, some of the early sources of tin for smithing. In competition with other Scythians, as is Scythian tradition, the Tocharians are understood to have displaced the Saka from Northern China near the Ili River. As with the Saka, the Tocharians were major proponents of Buddhism, and served a large role spreading Buddhism, a native Indian religion, into China. The Yuezhi apparently had some conflict with the Indo-Parthian kingdom, whom they resided nearby for some time. TheYuezhi likely took the form, also, of the Yue, from whom the Chinese language of Cantonese is derived. Scythians made it all the way to Mongolia, in the form of the Pazyryk culture. Yuezhi were also the people the started the Kushan Empire, a massive empire that wrestled itself a place between the Parthians and the Indian peoples, perhaps the foremost disseminator of Buddhism to the West as well as to China. They were major affiliates of the Qin, but had come up against groups such as the Xiongnu, Han, and Huns, likely, with elements of the Qin,[1016] derivatives of the same people, coming from an ancestor called *Yu the Great* who had apparently controlled the floods.

Lao Tzu, the founder of the philosophy of Taoism, coming out of the famous Hundred Schools of Thought informing the Warring States Period following after the Spring and Autumn Period, is likely to have had Scythian origins. Known as *Old Dan* or *Dan Li*, Lao Tzu taught *the Way*, or *the Tao*, a concept not entirely unlike the Greek and Chrisitian concept of *the Logos*. His philosophy would compete with those of others, such as Confucius and Mozi (perhaps named after Moses). It is my opinion that both Buddha's and Odin's names are derived from *Lao Tzu*, the author of the *Tao te Ching* and founding figure of Taoism. That is, it is possible that Old Dan is connected to the Tribe of Dan that seems to have conquered much of Europe, leaving its legacy in names such as the *Don River*, *Dnieper*, *Denmark*, and so on, perhaps leaving behind also the legacy taken up later by *Bodan* and *Wotan*. This would suggest that the Taoist philosophy of *wu wei*— or not forcing things—has been wildly successful, and is still marching forward. This concept is very conducive to mutualism. Much of Chinese philosophy would come to influence the West, though largely indirectly until after the Age of Enlightenment when translated Chinese works started to become more widespread.

Dravidians, Jats, and the Jat Belt

In South India and Sri Lanka there is a group of very dark-skinned people, among them the Tamils, who speak a *Dravidian* language. It seems to me that the Dravidians, sometimes called the *Indo-Melanid* or *paleo-Indid* race, are themselves an archaic post-Levantoid and Australoid mixed with some Cro-Magnoid or Mechtoid, [1017] as a proto-Mediterranoid group,[1018] their relatives composing the substrate of

---

major city of the Tocharians, and that the Yuezhi (possibly another name for the Tocharians) could also been known as *Guti* ("Goth")

[1016] The Qin are claimed to have descended from Gao Yao, a political advisor sometimes associated with Lao Tzu's lineage of *Li*

[1017] If Caucasoid, proto-Mediteranoid, or post-Mechtoid, Dravidians may have developed in the Caucasus among proto-Turanians, in Iran or Pakistan, or even in North or on the Horn of Africa or in nearby Arabia (India having been occupied by Australoids), perhaps having some relation to the Nilotic-Cushitic people and contributing to the lineage of the Hamites and Semites, spreading from Afro-Arabia to become influential all along the Indian Ocean and out into Indonesia. It may be that Dravidians are better categorized as a proto-Caucasoid group of, say, Mediterranoids, possibly proto-*Arabids* coming from the Arabian Peninsula. Their dark-skinned phenotype was

South and West Asians of mid- and lower-level castes (Tamil Dravidians called *Adi Dravida* or "first Dravidians" are considered to be *Dalits* or "untouchables" and are pariahed as the lowest caste). They seem themselves to be a transition between Australoid and Cro-Magnoid with Levantoid mixed in. The Levantoid superstrate in Dravidians may be responsible for early Neolithic farming in India. The larger grouping of Elamo-Dravidians are related to the Mediterranoid race more generally as a substrate, as is found especially in India and on the Arabian peninsula, in South-Central Eurasia, in North Africa (including as a component in Berber heritage), and perhaps some of Africa's horn, and Southern and even coastal Western Europe.[1019]

It may be that albino Dravidians or a derivative ethnicity were among those who contributed toward the first white Caucasians, perhaps coalescing with albino Australoids in the highland convergence zones, taking refuge from persecution and from the hot Sun, finding themselves eventually in the mountains of the Iranian plateu along trading routes following the path of the Sun, in groups such as the *Gutians*, Iranian barbarians, and otherwise with albinos coming from out of Africa and the Levant taking refuge in the Caucasus. However, this process may have begun much earlier, perhaps in Africa, perhaps giving rise first to ruddy- or olive-skinned peoples, perhaps including Cro-Magnoids, Mechtoids, Mediterranoids, or Alpinid Caucasoids, before continuing the cycle produced even more individuals with, perhaps, greater degrees of albinism or of success with sexual selection, growing a larger, lighter population.[1020] The Dravidians (as well as other people, such as the Munda) may be considered proto-Jat people; that is, people who preconfigured the relationship that would take place between India and Northern Europe, *Jats* being a mixture between Indians and Europeans. John Yarker sources the artisan class as a whole in what may have been Dravido-Jattian origins, as a caste effort of mixed race, such as might be found among the Jats (themselves, remember, being that mixture between Aryans and Dravidians). He says, "this confederacy is evidently a mixed caste, and as the two higher castes [...] refused them recognition, it seems evident [...] that these builders were a mixture of Aryans and aborigines, who had their existence as a Fraternity before caste existed, and from the evidence adduced [...] and the splendour of their labor, a branch of the Cabiric fraternity."[1021] These are the great megalithic builders, the Cylcopians, to which Freemasonry traces its foundation, possibly since the time of John Toland or beyond.

Dravidians, and in particular Tamils, once had a very important trading civilization affiliated with the Harrapan or Indus Valley civilization lineage, making them potentially the true founders of civilization or of large cities. That is, unless L.A. Waddel was right, that Sumerians were behind the Indus Valley Civilization. Either way, this society is considered to rank with the classics of civilizations, such as with

---

common to Pygmies and many Australoids and Cro-Magnoids (perhaps the only other sapiens of the time aside from Capoids), perhaps having been shared with a prior and potentially lingering Erectoid race and with Neanderthal.

[1018] Along the way, they are likely to have mixed with some of the Veddoids, and to have pushed them out into the islands, like Sri Lanka, where they would later join them when pushed out by the lighter-complexioned and fairer-featured Aryans. Some of the Mehri, Soqotri, and Baloch people of the Southern Middle East, for instance, are very dark, as is expected to have been the case before lighter-skinned Semites and Indo-Aryans incorporated them and pushed them to the margins. Much as the Aryans and Scythians— Indo-Iranian peoples— assimilated and pushed the Dravidians and their kin to the margins of the South Indian and Arabian peninsulas, the Dravidians themselves may have subsumed and largely pressed earlier Australoid people out (some remain in the form of Veddoids and other ethnic groups) with the help of others such as the Southeast Asians, into Melanesia and Australia, perhaps even into the Americas. This is likely to have occurred after some climatic change made the costs worthwhile for the invaders.

[1019] This relationship is more likely from the Mediterrean rather than from Indo-Oceania.

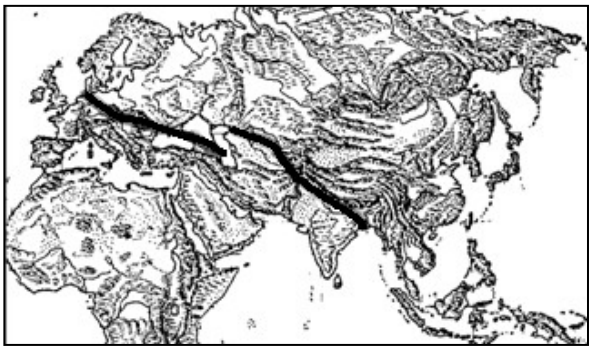
[1020] It may be assumed, perhaps, that early albinos would have readily mixed with tolerant outsiders, thereby reducing albinism, until a sufficiently large albino tribe existed with an inbreeding, albino ruling class

[1021] Yarker, 66

the early Mesopotamians and Egyptians.[1022] According to P. Priyadarshi, in "The First Civilization of the World":

> Findings of world's oldest farming sites from Ganga Valley (India) have only supplied the missing link in the story of evolution of farming. Ganga Valley, Mehrgarh, Darstan (Balouchistan of East Iran), Zagros (West Iran), the Fertile Crescent (Iraq), and Turkey are like footsteps in the march of farming culture starting from India to Europe.[1023]

Priyadarshi further says that "there was a human migration starting from India to West Asia with which there was also a migration of farming culture, art of pottery-making, and ceramic figurine to West Asia and South Europe." Weaving is also included further in as having come from India. This is consistent with the idea that Alpinid farmers coming from the East had brought farming, weaving, and pottery-making with them into Europe, and it seems to be consistent also with the development of the axe-making peoples along Movius's Line.[1024] Advanced farming seems to have progressed up the *Jat Belt*, a strip from Northwest India extending into Pakistan, and arguably further into Afghanistan, Arabia, Central Asia, and Europe, going from the Ganga Valley, through Balochistan, the Zagros Mountains of the Gutians (Jats have also been called *Guts* or *Gutes*), and Fertile Crescent, on into Europe. Today, suggests Burdak, the Jat Belt— which "comes in discussions frequently during elections in India," because "the support of these areas is very crucial for [...] winning elections"[1025]— extends from India through Pakistan, but it is likely to have gone from India or even Indonesia all the way up to Scandinavia, or at least to Jutland, at one time, perhaps tracing a long-gone equatorial line. Interestingly, the residents of Balochistan, the *Brahui* people— ethnically Balochi, and found as far North as Turkmenistan— speak a Dravidian language, and the Baloch people of Balochistan, of which they are a part, are in general called *Juts*, not entirely unlike the Gutes of Gotland, the Jutes of Jutland, and Geats[1026] of Gotaland in Scandinavia. What would become the Jats would emerge outside of India in the Levant and in Europe up to Jutland and beyond—perhaps where they came from—, along what now remains, only in part, as the present Jat Belt.



Movius's Line

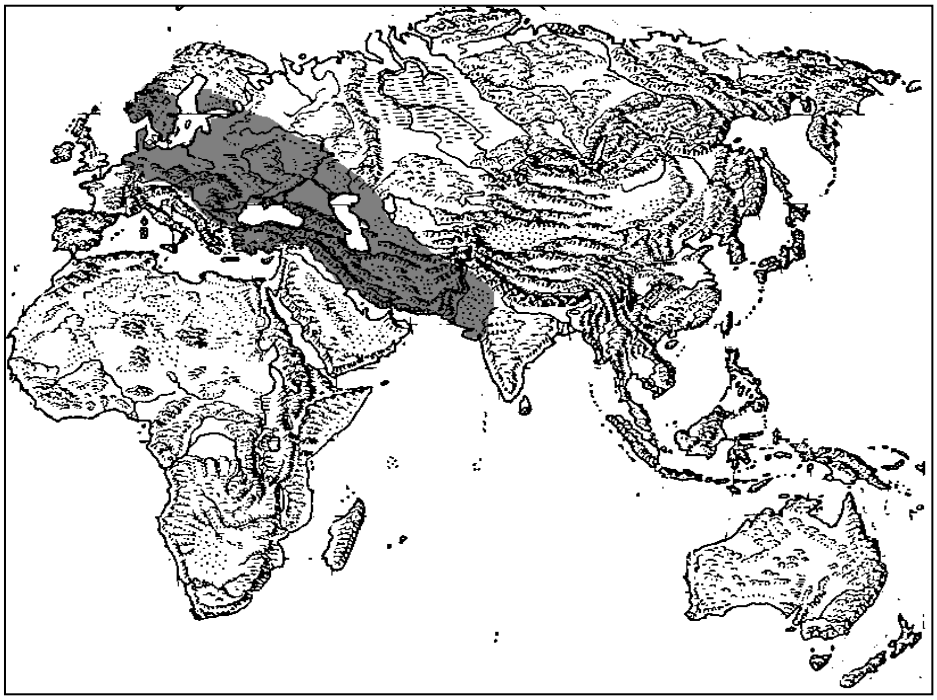
[1022] This despite their inability to blush, suggesting that, while Natufians may have had blushing to thank for their advantage, that this was not a checkmate upon other races, and in particular dark ones, but may have served as a stepping stone to educate the entire human race about what may be achieved with a higher degree of honesty, something that may be achieved by people of any race.

[1023] Priyadarshi

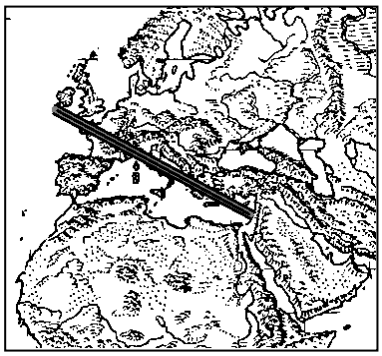
[1024] The Jats themselves are not necessarily Alpine people, but represent more of a proto-Nordic, Mediterranoid superstrate imposed atop a Dravidian (Mediterranoid and Australoid) substrate, perhaps containing some Cro-Magnon from long ago. However, Indo-European peoples, such as late renditions of the Jats (whose substrate shows Dravidian and Australoid), made a regular habit of turning Alpinids into peasants, as occurred with the Gutians and the Painted Pottery People

[1025] Burdak[1]

[1026] Along with the Gutes an ancestor of the Swedes



Theoretical range of the Jat Belt as it once existed



The Jat Belt may be connected to what Alfred Watkins and some of his followers have called "*ley lines*," around which much pseudoscience has also been constructed, but which were originally conceived of as trade routes that followed the path of the sun from sunrise to sunset, especially at Solstice. One such line, described by John Michel—the fellow who first theorized the existence of black holes—, is *St. Michael's Line*, which runs somewhat parallel to a line extended between the Jat Belt and Jutland, marked by monuments to St. Michael today, perhaps owing to knowledge not shared with the public (suggest some supporters of the concept) that was known to ancient Atlantids.

The Indus Valley Civilization had met its doom when introduced to Aryan invaders, which would transform the nature of Harrapan society toward Indo-European religion and politics. The Yamnayan-related proto-Nordid, Alpinized by Beaker-like and Lapp-like subraces, had spread and intermingled across Europe and Asia, mixing with others and becoming the Pitted Ware, Battle-Axe People, Sintasha, Halstatt, and other cultures along the way. These Alpinized proto-Nordid Mediterranoids,[1027] here collectively referred to as *Aryans*,[1028] had replaced (and in part had been derived from) the European hunter-gatherers, the Cro-Magnoids, and forced the Alpinids to pay tribute. Mixing some with the Alpines and Turanids, the proto-Nordid steppe people, derived nonetheless from the Mediterranoid race, pushed downward and established themselves as the Aryan ruling caste and Brahmins of Bronze

[1027] It must be understood that the Celts have a strong Alpine substrate and even superstrate, and are not limited to the Aryan Nordic phenotype associated with the Yamnaya, though their culture was brought largely through the Aryan Halstatt culture sourced in part from Yamnaya. Race and ethnicity, or cultural group, are not the same thing. People of different races may be part of the same ethnicity or cultural group. At some point, the Celtic-Italic and Germanic peoples split from one another, as might be seen, perhaps, among the Tungri, Condrusi, Belgae or Cimbri, for instance.

[1028] Perhaps the best living example of an Aryan steppe people, such as those coming from the Yamnaya, are the *Drokpa,* yak-herding people indigenous to Western Tibet. They may also be called *Dropka*, *Brokpa*, *Bropka*, or etc.

Age India as well. Similar Indo-European or related peoples had also become the rulers of countries throughout even the Eastern world.[1029] Indeed, Iron Age invasions, by the Scythians and others, would follow the example set by the Yamnayan-derived or influenced Indo-Aryans. The Indo-Scythians had conquered parts of North India, almost as if a second wave of Aryans, and then spread across Europe as Germanic people.

While having connections through their Dravidian substrate to Cro-Magnoids, Jats typically identify as an Aryan people, despite their often mid-toned or even dark complexion. Even more than with the Cro-Mags or the Aryan Yamnaya, the Jats tend to identify themselves with the proto-Nordid Scythians, especially the Getae, or Goths,[1030] but also the Saka (perhaps itself a Goth subset). David G. Mahal and Ianis G. Matsoukas, in "Y-SRT Haplogroup Diversity in the Jat Population Reveals Several Different Ancient Origins," write that

> The Jats represent a large ethnic community that has inhabited the northwest region of India and Pakistan for several thousand years [...] Many historians and academics have asserted that the Jats are descendants of Aryans, Scythians, or other ancient people that arrived and lived in northern India at one time. Essentially, the specific origin of these people has remained a matter of contention for a long time. [Our] study demonstrated that the origins of Jats [...] had several different lines of ancestry and emerged from at least nine different geographical regions of the world. It also became evident that the Jats did not have a unique set of genes, but shared an underlying genetic unity with several other ethnic communities in the Indian subcontinent."[1031]

Whatever the case, they turn out to be responsible for multiple waves of racial superstrates in Afro-Eurasia and[1032] might be considered the Mediterranoid race itself to some extent, from which (when mixed with Neanderthal) Caucasoids, Alpinids, and Turanids are at least partially derived, and of which (with some admixture by these others) Nordid is a mutation, an albino.[1033]

During the Iron Age, if not starting before that, the *Brahmins* in India— a caste of Aryan priest-rulers— were strongly opposed by the Jats and others.[1034] The Indian Jats, after all, had perhaps been related to Dravidian peasant warriors who, upon defeat and after mixing with the Aryans,[1035] particularly the Scythian *Getae* or Goths, but also the Saka, became the merchant class, or *Vaishyas*. The Jats were anti-Brahminical because they were against the caste system element of "untouchability," or of *Dalits*

[1029] In Europe, the Bronze Age Yamnaya and their derivatives would ultimately become the Iron Age Greeks, Celts, Romans, Slavs, Thracians, Scythians, etc. From them, as they conquered in similar patterns, would be derived a good portion of the Iron Age ruling classes in Europe, West Asia, and North Africa. Along their journey, they and their relatives built palisades and baileys, or causeways, much as their megalithic ancestors had done. They may have founded China, as well, by way of the Yuezhi and others.

[1030] John Pinkerton, in *A Dissertation on the Origin and Progress of the Scythians or Goths* argues strongly that *Goth*, *Getae*, *Scythian* and such terms were and may be used interchangeably

[1031] Mahal and Matsoukas

[1032] In conjunction with the Atlantians or Mauretanians and peoples of the Ancient Indo-Malayasian and Oceanic people that they subsumed, as well as indigenous Levantoids, Mechtoids, and Cro-Magnoids derived from *Homo heidelbergensis* and other *Homo erectoids*

[1033] Mediterranoids, remember, had already partially albinized, leading to their brown, copper, bronze, and olive complexions

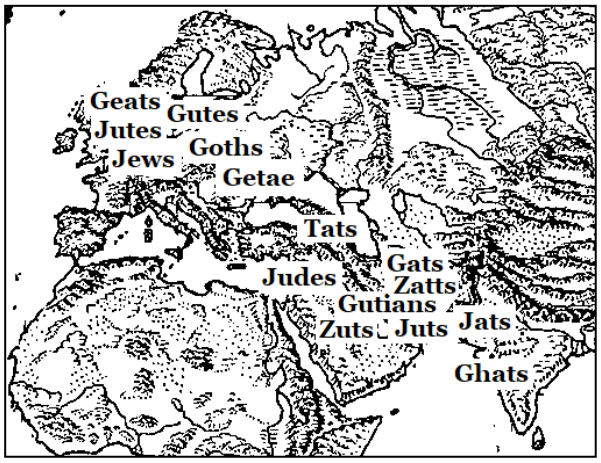
[1034] *Jati* simply refers to groupings of people, such as by clan, tribe, or caste

[1035] Jats are not as dark in complexion as pure Dravidians are. Typical of most Indo-European –ruled societies, the people of Indian tend to be light-skinned at the top of the hierarchy, mid-toned midway down, and dark at the bottom. Jats represent an economically lower-upper class or upper-middle class people, but are on the third level of four castes. They are economically upper class only when due to their common positions as landlords, usurers, and bosses to Shudras.

(probably having had some relation), Dalits being the darkest-skinned people of India, perhaps related to Levantoid or Australoid ancestry. The Jats had opposed the Brahmins on the basis that this caste arrangement, of "untouchables," was unacceptable to them, perhaps because of some relation to the Tamil Dravidians, who had been labeled such, as *Dalits*, but possibly for genuine humanitarian reasons or as an early flex of political correctness, perhaps both. Jats, having opposed the caste system of the "untouchables," would take very favorably toward Buddhism, which had taken the same position.[1036]

The struggle against Brahminical authority seems to have some relevance for us even today. Thomas Picketty divides contemporary politics between a "Brahmin Left" and a "Merchant Right," pointing out that Leftists used to be both uneducated and low-income, while today they are very educated; while the uneducated but wealthy remain Right-wing. He chooses this terminology because this is a conflict that goes back well back into Vedic times, if not longer. He expects a return to class conflict and a cleavage between the high-educated and high-income globalists and the low-educated, low-income nativists, which he associates with the future of the Brahmins and the Merchants. It seems that this conflict between the Merchants and the Brahmins takes an early form with the Jats. The Jats were a tribal caste of pastoral landlords and moneylenders (perhaps originally sourced from peasant farmers or warriors, artisans, or etc.).

In a sense, it may not be wrong to refer to the general migration tendency established by Cro-Mags and Australoids between the Gutes of Scandinavia, Gutians of Iran, Gats of Afghanistan, and the Ghats and Jats of India, in general, by any one or a *portmanteau* of these signifiers and these relatives. I choose to use the term *Jat* for all of these groups in the general sense because it connects the East to the minds of my Western readership. It is likely that the spread of Jats, in this sense, was not purely linear, so much as emergent, and that *Jat* was simply the Indian rendition of what would be known as *Getae*, *Goth*, or etc. in other locations, meaning, like *Ghat*, "mountain people." *Jat*, *Gute*, *Getae*, *Jut*, *Gutian*, *Judah*, *Goth*, and a wide list of names— which I am speaking of in the most general sense with a widely-defined *Jat* for the sake of connecting the phenomenon to its reach in India— generally seem to have some discoverable reference to mountains or water, perhaps loosely definable as "mountains as the source of water" or "water sourced from mountains," but often simply meaning "mountain" or "stream" or something similar, when direct. It's important to consider the role of mountains and mountain peoples, and especially their proximity to water, to the origins of civilization, especially stratified civilization under the authority of a priestly class. "Joshua," in *The Bible*, verse 15:48 refers to "Jattir" a town in the hill country of Judah. The *Deva Samhita* has Shiva saying that "the Jats are the prime rulers of the Earth."



Jats, in the widest sense, or in the sense of their relatives anyway, became the ruling class of Europe, [1037] known variously but specifically in the Iron Age as *Jutes*, *Anglo-Saxons*, *Scots*, *Goths*, etc., especially

[1036] Modern Jats can be found to participate in Hinduism, Buddhism, Islam, and Sikhism. Jats are also known to worship their ancestors

[1037] In the widest sense, I use *Jat* in this work to refer to any group having a direct and significant relationship to Jats, including Jats themselves, Juts, Zuts, Zatts, Getae, Saka, Goths, Judaites, and so on. In suggesting that Jats established themselves as the rulers of Europe, I do not mean to suggest that the specific caste in India did so, but rather tribal groups related to Jats in this larger sense of being mountain people, Indo-Scythians, or etc. I use the

after the Fall of Rome. Some Jats or Jat-like people in Europe would come to be known as *Jews* after their city-state or kingdom of *Judah*, named after a son of Isaac, and shared relation to the similarly Hebrew-derived Radhanites. *Judah* is derivative of *Jud* which is essentially *Jut* or *Jat*, related also to *Gute* and *Gutian*. Jats are also called *Juts* and may at times have a Jewish-like Caucasoid or Armenid nose. They are also known as *Tats* and are often compared to Mountain Jews.[1038] Not only are they engaged in similar traditional professions (usury, merchandising), but Abraham had been born in the Elamo-Dravidian Sumerian region where the the early proto-Jats had been more prominent at the time, his name perhaps having direct reference to Brahmanism, though he had taken to Atenist or Zoroastrian-style monotheism. Contemporary Jats still appear to have some similarities with European Jews, including choice of profession as moneylenders. Laxman Burdak, in "Sihag," writes that the Sihag (or Asiagh), a Jat clan that uses a black flag with crossed swords, are "known as Ashkenaz in Iran," as well as "Asiani in Greece, Asii in Central Asia, and Asika in old Iranian literature like Mahabharata."[1039]

Together, this Israelite-Scythian and Judahite-Radhanite European ruling class of Germanic Nordid and Caucasian whites, possibly a result of albinism[1040]— the Anglo-Saxons and Jutes or Normans—, would breed with peasant women and send peasant men to war, thereby whitening the people of Europe, especially its middle class, who nonetheless maintain a diverse genetic substrate, despite their shared phenotype (which had already been whitened some as Alpinids).

Jat social organization is similar in some respects to those of the Israelite and Germanic peoples, or the Jews (also called *Yuehzi* or *Goths*) and the Anglo-Saxons (who also called *Samaritans*, *Sarmatians*, or *Saka*, among other things). The Israelites, before their having accepted a king, were ruled by judges, as described in *The Bible*. Quite similarly, and due to their having been Israelites, the Germanic peoples made use of *Things*, democratic assemblies led by lawspeakers;[1041] *heathen hofs* or "houses" that were used as assembly halls and courtrooms led by *Godis* or *Gothis*; common law courts with judges who ruled according to established precedents, or etc. Similarly, in some respects, the Jats have a system of *panchayati*, or "self-government," wherein democratic assemblies, that are also dispute-resolution meetings, are held, presided over by a *panche*. Higher level assemblies are called *gohands*. Higher level assemblies are usually composed of elected officials chosen from the middle level, but lower levels than that are unaware of who the participants of upper gohands are. Laxman Burdak writes, in "Life, culture and traditions of Jat People," at *Jatland*, that Jats tend to organize "themselves into hundreds of patrilineage Gotras," which he calls the "Panchayat system or Khap." In this system, a "clan was based on one small gotra or a number of related gotras under one elected leader whose word was law," and "[m]utual quarrels of any intensity could be settled by orders of Jat elders." When necessary, such as during threats, "the whole clan rallied under the banner of the leader." The Jat Khap or Panchayat "system is territorial and highly democratic."[1042] The Jat Panchayats are organized from the village level

---

term despite its being "problematic," but with this note attached, in order to bring attention to the Gute-Gutian-Jat zone ranging from Jutland to Jatland, which represents an important hybridization and pilgrimage zone and which nullifies the sharp distinctions some try to make between Jews and Anglo-Saxons which lead to much racial and ethnic misunderstanding.

[1038] *Tat* was also the son of Hermes Trismegistus

[1039] Burdak[2]

[1040] Possibly shunned for being white Dalits, or Dalits who look like Brahmins, and then pale and fair-skinned albino Aryans

[1041] Before the Saxons had kings they were led by lawspeakers or *amoraim* whose duty it was to speak the law for the *Thing*, or assembly. Saxon chieftains and kings, later on, were known to wear snakes on their beltbuckles, emblematic of their ability to change form or shapeshift. The Pharaohs of Egypt were known to have had serpents on their headdresses, perhaps representing something like the *kundalini* of Indian philosophy; the Saxons as the Saka would have been well-exposed to this idea.

[1042] Burdak[3]

up to a district and then something like an Allthing— a Germanic assembly between the "Things" of all regions— the *All India Jat Mahasabha*. Their system is "territorial and highly democratic, such that when an issue arises in the community, such as a dispute, "a gathering of the Panchayat is called for every member has the right to attend, express his views and vote for or against a proposal." Apparently, there are "no elected or nominated Panchayat officials," but "[n]evertheless, some persons, by virtue of their wisdom and eloquence, are automatically accepted as Panches, (one of the five) and their views are heard and respected." Further,

> All decisions are taken after open-hearing, full and voluntary expression of views and consensus vote. Even if one of the contending parties considers the Panchayat decision unfair it is accepted and complied with without question. [1043]

Despite the exoteric democracy, however, there were higher levels of *Panchayat*, the *Gohand*. While theoretically a practice of cellular or nested democratic republicanism, it also seems vulnerable to secrecy at the higher levels, though arguably a secrecy accountable to the lower levels.

> The right of attendance and expression was open to every one, whatever the level of the Panchayat. Generally, however, selected-representatives of the villages attended the Panchayats of the 'Gohand' and higher level [groupings of villages]. Leaders were elected and appointed [...] who maintained records of decisions and had the authority to call an assembly.[1044]

Jats apparently do not recognize social status based on wealth, but consider each other to be equals, except in regard to age, wherein elders are given priority.

> All Jats, irrespective of their official or financial positions in life, have equal social status. The only criterion of superiority is age. If two Jats sit on a bed the elder, even if he is a poor farmer, will sit towards the head of the bed, and the younger, even if he is a very well to do, or is a senior civil or military officer, will sit towards the foor of the bed. If a number of Jats are sharing the same 'hooka' it is the duty of the youngest to hold the 'hooka' and pass it around in turn to the others. The system is thus of a very socialistic nature. [1045]

Still, "[w]hile elders discuss a problem it is customary for younger people not to speak but to sit and listen," and, despite their fairly advanced but liberal or free and (secretive) democratic or egalitarian methods of organization, Jats still practice endogamy. For instance,

> The Jats are required to marry within their community. A Jat boy marrying a non-Jat girl, though not encouraged or approved, is nevertheless acceptable. A Jat girl marrying a non Jat boy is, however, taboo, and, should it happen it is considered a permanent blot of disgrace on the girl's family. [1046]

It is clear that the Jats naturally maintain a liberal, socialistic society, but one which is also somewhat secretive, and that this is maintained in a way similar to the Israelites and later German peoples, through assemblies, judges, and so on. This is a very mutualistic way of life[1047] in comparison to many other manners of organization, and it has much to do with the success of the Jat people and related Scythian-derived peoples, peoples such as the Anglo-Saxons.

[1043] Burdak3
[1044] Burdak3
[1045] Burdak3
[1046] Burdak3
[1047] Perhaps excluding the secrecy of the upper levels, which lends itself to synarchy

The Jat and Germanic manners of assembly are themselves renditions of or deviations from the megalithic builders, and they are themselves carried on largely in the form of Freemasonry and its lodge system.[1048] Another group, the *Druze*— curiously having a name sounding like "Druid," and not being too far from *Galatia*, the homeland of *Gauls*, or Celts,[1049] while also having a village called *Jat* in Israel —, also come from the megalithic builders, and are very open about their religion being essentially the same as contemporary Freemasonry. According to Burdak, in "Golia,"[1050] there is a Jat or Jat-intermarrying group that had been called the *Golia* who had been Brahmins in India but had fallen down in the caste status. Burdak links to the article on the Golia from his page on Gaul, listing "Jat clans" beneath a list of linguistic variants of *Gaul*. He also uses the spelling *Gaulia* when linking to the Golia, implying some relationship between the Gauls and the Golia.[1051],[1052] It seems that the Druids and the Brahmins shared an affinity together, and that both were taken down, together, by the Jats.

Nordids and Congoids

The Cro-Magnoids had likely contributed to the larger substrate of Europe, and especially of the Scandinavians who might be referred to— though with some stretch as they are more of a substrate and component than a superstrate or true prototype— as *proto-Nordid* people, people who would contribute toward the genetic heritage of Nordic peoples, generally associated with Celtic and especially Germanic and Iranic peoples. This contribution likely involved the constant theme, in human evolution, of hybridization and convergence, of Mediterranoid with other peoples, including Alpinids or Caucasoids and Lappoids. Early on, this hybridization involved the combination of Cro-Magnoids and Levantoids, perhaps including some Australoids or Dravidians, into the Basal Europeans. Some consider the Mediterranoid or its *Xanthanchroi* variant, the proto-Nordid or Nordid-proper, to be Caucasoid or proto-Caucasoid, but the Nordid is most certainly sourced from the Mediterranoid, even if this is the case. The Nordid is characterized by having light skin, light hair, and light eyes, typically blonde-haired and blue-eyed by archetype.

The megalithic builders, perhaps anticipants of Yamnaya, had occupied the Stone Age site of Whitehawk Camp in Britain, which contains a woman whose skeleton was found and whose face was reconstructed, sharing ethnic similarities with Jats and early Sardinians.[1053, 1054] These Whitehawk Camp people are suggested to have been related to the Windmill Hill culture, which may have first worked on the famous megalithic Stonehenge site,[1055] and who were nonetheless, and like the Indo-Europeans, a kurgan or tumuli-related people, as builders of long barrows. The long barrow builders tended to remain on the coast of Western Europe. Perhaps most likely, these seafaring people would follow what would become St. Michael's line, a part-way sea route from Israel through Anatolia, Greece, Italy, and

[1048] However, this may be a later rendition of Freemasonry, as some claim that Freemasonry originally only had one degree and was entirely free of hierarchy, such as exists between the Grand Lodge and the local lodges
[1049] Galatians may be Gauls who invaded past Greece and into Phrygia
[1050] See Burdak[4]
[1051] See Burdak[5]
[1052] Burdak dismisses linguistic connections between *Gaul*, *Gael*, and others, while others are not so quick to do so
[1053] However, her preceding even the Yamnaya, suggests that the Jat Belt preceded even the Indo-European language family
[1054] The existence of these megalithic builders alludes to a time when the Mechtoid or the Mediterranoid race had populated Europe, the Jat Belt perhaps being a reconvergence of the remains— of a post-Mechtoid, Mediterranoid empire— left from a Nordic takeover. Freemasonry alludes to having origins in the megalithic builders, masonry referring to stone work
[1055] The Whitehawk Camp people are likely culturally and partially genetically-related to the megalithic— giant stone structure— builders of Gobekli Tepe, Nevali Cori, Atlit Yam, and other sites across maritime Eurasia, as with Stonehenge, North Africa, among other locations.

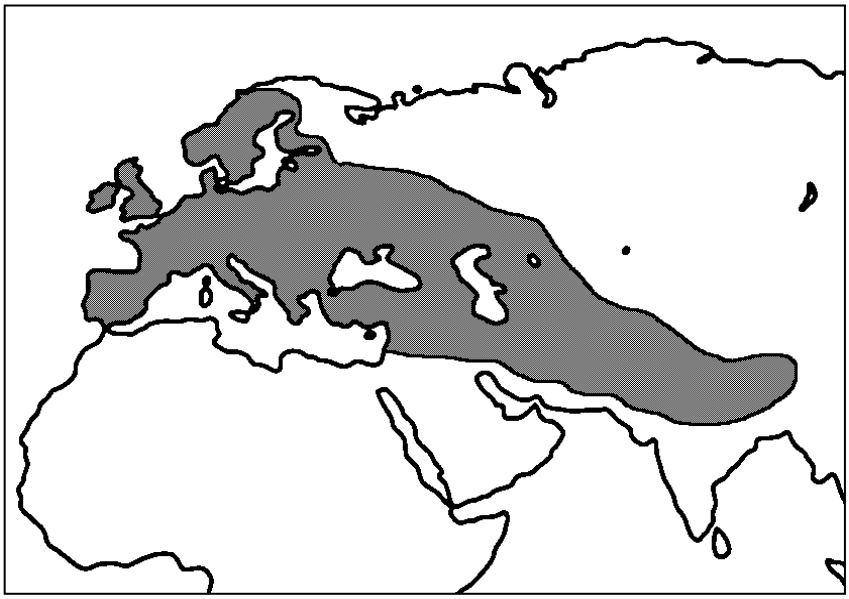
France to England and Ireland, corresponding with paths taken by the megalithic builders. They may later have pushed back down the Jat Belt toward India by way of the Volga, Dnieper, or other rivers, much as the Nordic people, perhaps the cultural if not racial progeny of these peoples, would do later on.

It appears that the Germanic and possibly Celtic people have their home in what used to be a much more far-reaching Jat Belt than what exists today. The Jat Belt likely extended, in a more primitive form, between people such as the Battle-Axe Culture in Northern Europe and the Gutians of the Zagros Mountains in Iran, and later on from the Jutes, Geats, and Gutes of Jutland,[1056] Gotaland, and Gotland through the migrating Goths and Getae, the Jews of Judah and Khazaria, and the Juts and Jats of Pakistan and India, throughout an extended amount of time.[1057] These Indo-Europeans extended beyond the Belt to places as far as China, as with the Yuezhi, who have been connected to the presence there of the Jews. Both the Gutians (their language often considered to have been related to the Indo-Europeans of the Tarim Basin, the Tocharians) and the European Germanics (clearly Indo-European) are understood to have been battle-axe-wielding barbarians, the Gutians having attacked civilizations such as the Akkadian Empire in the Fertile Crescent, and the Germanics having raided civilizations such as the Romans in Europe.

Along the soon to be Jat Belt, that extended between the Gutians and the Battle-Axe People (who would eventually be called by names such as *Gutes*), lived tribes of people who would become known by such titles as the *Thracians*, and relatedly the *Dacians*, *Phrygians*, *Lydians*, and the *Getae*, or *Scythians*, who derived from these others. These Thraco-Scythians were Indo-European people whose culture had largely converged with or had come from the Samara or Yamnaya, such as the Sintashta, but who had also incorporated local Cro-Magnoids, Basal Eurasians, and Alpinids from the Balkans into their stock, incorporating elements of the Beaker and Varna cultures, for instance, and had further reconverged with new genetic material back in their homeland on the Pontic Steppe, a kind of neo-Yamnaya or Yamnaya revival group, perhaps. The *Solnitsata* or *Varna* had come from the Painted Pottery People called the *Karanovo culture*, and controlled one of the earliest fortifications,[1058] in a location where the Thracians eventually occupied and warred with others, at a salt mine (salt monopoly), where much gold is found.[1059] If the Yamnaya were a source for Bronze Age Aryans along the Jat Belt and throughout the steppes, it was the Scythians, a complex here including groups such as the Saka, Getae, Cimmerians, Sarmatians, Alans, and Parni, among others, who served this role during the Iron Age. Scythians coming from out of India—the Indo-Scythians—, perhaps some relatives or derivatives of the Jats,[1060] would become the progenitors of what would become the *Nordid race*,[1061] a race of pale-skinned, light-featured Mediterranoids associated especially with Germanic culture.[1062] Because of the recessive nature of Nordid features, genetically-speaking, it may be that these features had begun as a mutation of albinism or some other manner of depigmentation which was isolated and maintained through selective

[1056] Not to be confused with the Jutland that is to be found in Pakistan, also originally home to Jats
[1057] Not all of these groups are contemporaries
[1058] The Sesklo site in Greece is older, and has rock walls
[1059] Interestingly, in theme with the earlier Varna people
[1060] The Indian Jats, having likely come from a Scythian superstrate and Dravidian substrate, are considered a Scythian people from Southern Eurasia and West Asia
[1061] The images of Nordid and Congoid are derived from images at humanphenotypes.net
[1062] The substrate of Europe is that of the Australoid-related hunter-gatherer, Cro-Magnoid, and relatives, and of the Alpine and Mediterranean race, but this has since been covered by successive waves from more Easterly peoples, particularly proto-Nordic herding peoples from both the Northern and Southern Eurasian and Asian steppes, such as the Celts and Thracio-Scythians

inbreeding. It is well-known that the ruling classes of Europe, derived from these Germanic Nordics, were inbred for the sake of maintaining their "pure" white bloodlines.[1063]



From the wider Thracio-Scythian culture, among others, would be derived the cultures of the Iranic and Germanic tribes, including the Alans, Goths, Vandals, Teutons, Angles, Saxons, Jutes, and etc. These Jats, or more properly relatives of Jats, would establish the homeland of the Nordic race along the ancient Jat Belt and surrounding areas, conquering Europe as the Danes, Jutes, Anglo-Saxons, Normans, and moving on into Asia as the Rus, becoming the ruling caste over Alpinid, Mediterranoid, and even some Turanid Celts, Italians, Greeks, Balts, Slavs, and other peoples of Europe, who became their slaves, serfs, and— especially when intermarriage occurred— artisans and free men under their stately and priestly authority. As these tribes conquered surrounding peoples, they established themselves as rulers over them, and turned them to slaves and serfs, laying over an Alpine and Mediterranean racial substrate a Nordic one. This Nordic type would spread further, after the Iron Age, with the advance of Anglo-Saxon rule into North America and that of Russian rule into Siberia. Each wave from out of the East has promised to protect the people of Europe from successive waves.

A linear view of Nordid evolution may go like this. Early Eurafricanid Mediterranoids among Natufian-sourced societies came into contact with a more gracile type, perhaps incoming Otamids coming from across the Bering Strait and through North Eurasia and possibly also by watercraft and into the Orient. This operated toward a more gracile Mediterranoid type, sometimes called a *gracile Mediterranid* or *proto-Nordid*, which would come to typify people such as the Saka and Samaritans, among others, and which would spread throughout the Mediterranean and the Atlantic, becoming in its most distant form the Atlantid subtype of Mediterranoid. After some introgression in Eastern Europe from blonde Cro-Magnoids and Lappoids and other Eastern Hunter-Gatherers and Ancient North Eurasians, they would gain some characteristics considered separately as Pontid. Those proto-Nordids and Pontids that had conquered down into India as Indo-Aryans and Indo-Scythians would leave an Indo-Nordid remnant, before travelling back toward Scandinavia where there was more introgression from light features

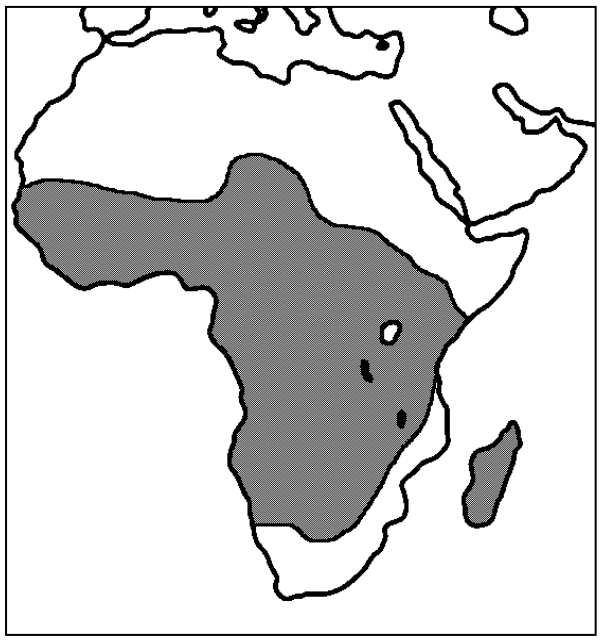
[1063] Anecdotally, black nationalists following the leadership of Elijah Mohammad maintain that white people were the creation of Jacob, whom they call *Yakub*, and whom they hold was a sort of mad scientist sort of figure. White people, they suggest, are a science experiment gone awry, something like the Frankenstein monster.

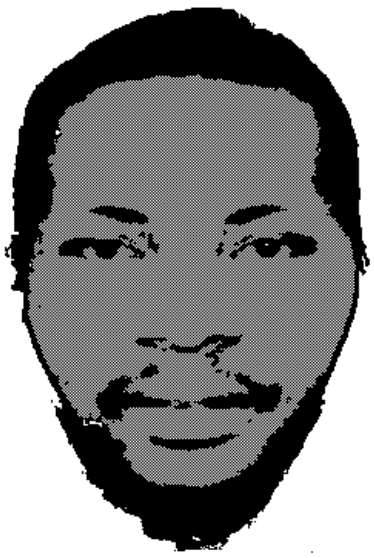
coming from out of Cro-Magnoid Western Hunter-Gatherers and Lappoid Ancient North Eurasians, producing the Nordid-proper, which spread especially from out of Scandinavia.

Africa is rich in different peoples, including Pygmies and Niger-Congoids, Capoids, and mixes thereof, as well as including Caucasoidal influences especially among Cushitic, Nilotic, Chadic, Ethiopic, and Horn Africans, derived potentially from Omoid or from Levantoid, Arabid, and likely some Australoid sources.

The African Sahara has long separated peoples from one another, but not entirely; the Green Sahara, the Nile River, which once stretched out into West Africa, and the short distance on the Red Sea, have allowed for migrations. These are typically migrations out from Africa, but there have nonetheless been migrations back into it as well. These back-migrations' biggest impact in sub-Saharan Africa was not racial or linguistic— Neanderthal genes, for instance, are not to be found in Africa in any significant amount—, but cultural or technological. The spread of cultural technology does not require exchange of genes or even memes on a tribal level, but only the spread of information, which can occur through physical exchange of objects, through even informal sign language, or through vocal exchange with even a limited number of translators.

While Nordids were speciating from their Mediterranoid base— in albinizing, mixing with others, and adapting to the environment— Congoids were reaching the milemarker of sapience from entirely different strands of *Homo erecti*. Sub-Saharan Africans are understood to have developed completely separately from Neanderthal, having an insignificant portion of Neanderthal genetics. This suggests that Neanderthal never really made it into Africa in any significant proportion. *Homo sapiens* have inhabited Africa for a very long time, however, specifically North Africa above the Sahara, but also along the Nile River, though did not travel much further South to establish any significant populations until around the time of the Iron Age. According to Coon, Congoids evolved separately from the Omoids, Levantoids, and visitors from the North, in the Niger-Congo area. Congoids would skip the Bronze Age and adopt the Iron Age technologies of the Indo-Eurafricanoids visiting the Congo from the North.





Pygmies, separated by a phenotype needed to live in the thick forests of Africa, are small Congoids[1064] who were selected primarily for periods of warmth, and probably once covered a wide range of Africa's jungle, being very ancient. How they got there is unknown, perhaps having been pressured by drought to take to the jungle or perhaps having been given little choice upon the expansion of the tropics during warmer times. Carleton S. Coon suggests that the Pygmies, themselves Congoid, were something like an ancestor group to the later "black" or Negro Congoid peoples (Pygmies may be more mahogany than black or chocolate) who are associated primarily with Bantu languages. The Bantu Congoid, or modern African Negroid, seems to have been a recent divergence from the Pygmy, with some geneflow from Mediterranoids and Caucasoids from the North and Capoids from the South. Congoids, both the Negroid and Pygmy, are associated with dark skin, frizzly or kinky black hair and dark eyes, and some degree of prognathism, which may also be absent in some Negroids, such as in some Horn African and Nilotic peoples, collectively called *Hamites*.[1065] The mahogany to "black" skin of the Congoid, like the dark skin of the Dravidian and Australoid, helps to withstand the heat of the Summer equatorial Sun.

The Ethiopians are, at times, classified with Indo-Eurafricanoids, owing to the high level of Levantoid in their background that has since been watered down by admixture with Congoid peoples. They have at other times received a classification of their own, as *Ethiopids*, distinct from Indo-Eurafricanoids as well as Congoids (though admitting admixture with both), or otherwise a component-member of the Mediterranoids.

Some Mediterranoid and proto-Nordid genetics and linguistic influence did enter into Africa, especially among Nilotic, Chadic, Ethiopic or Cushitic, and Horn Africans, but albinism did not spread— being a deleterious trait (by way of both ecological and social selection)— and neither did Eurafrican or Eurasian languages become normalized. The ancestors of the Bantu would take to farming, perhaps showing some contact with horticulturists from the North, and expanded from their likely homeland in the Congo region, having taken to farming and then metallurgy as learned from Mediterranean peoples. This may have included first Hebrews and then Israelites. Aria Nasi writes, in "The East African Israelites of Zanjiland," that

> After entering Africa by way of Egypt, many of the East African branch of Israelites followed the Nile River and Rift Valley Southward. It is interesting to note that the Biblically recorded migrations of the Hebrew Israelites closely resembles what historians have labeled as the 'Bantu Expansion.'[1066]

The Bantu Expansion is understood to have begun before the migrations of the Scythian Israelites into Africa, but the Scythians might be considered an impetus for later waves of expansion, playing the role of steppe invader, pushing other peoples of Africa Southward into the desserts, and especially around the rivers and foothills, refuge. Israelites, the Scythian Saka, had likely brought the Iron Age to Africa. This may be why the most formidable opponent of the British in sub-Saharan Africa had been the Zulu people, led by their famous leader, not accidentally named *Shaka*. The spread of iron would likely have required some immersion into basic smithing, as sub-Saharan Africa had not gone through a Bronze Age at this time. But only an initial mixing between Saka and the proto-Zulu— likely in Nigeria, Sudan, or North Congo— would be required for the cultural technology to be spread at a much quicker rate than a small sample of out-of-place genetics.

[1064] Pygmies fit into the Congoid classification as an archaic type

[1065] This is a Biblical reference. Indo-Europeans and Indo-Aryans are associated with Japheth and Semites with Shem

[1066] Nasi

While the Bantu languages and Congoid people had already been established as a substrate, new superstrates would form. Unlike in Europe, however, these superstrates were not Indo-European, or even Semitic, but Bantu over Khoisan, Bantu over Mbuti, and Bantu over Bantu. The Bantu Expansion, that is, would come at a cost for the non-Bantu peoples, such as the Pygmy and Capoid peoples especially, some of whom would be relocated, sometimes enslaved, sometimes sexually selected against in favor of growingly-polygamous Bantu men, among various other externalities imposed by the growth of the Bantu. Bantu Congoid men become polygamous with multiple Pygmy wives, but Bantu women cannot bear the Pygmy forest lifestyle, which requires a small size and great flexibility in order to move through the dense foliage, leaving a shortage of Pygmy wives. As for the Capoids, Coon says that

> Much later, in full historical times, some of the Negroes of West Africa who had acquired agriculture and iron metallurgy moved Eastward and Southward and in turn absorbed many of the Bushman tribes. They arrived in South Africa simultaneously with the Dutch. Bantu and Boer then formed the jaws of a giant pincers that drove the Bushmen into the Kalahari and led to the racial conflicts that beset that troubled land today. [1067]

As well as having—with the help of a changing climate— pushed the Capoid out of North Africa, and especially after industrialization in Europe bleeding into Africa, the Bantu Negroids would begin deforestation of Pygmy lands and establishing patron-client relationships, such as that between the Bushong Bantus and the Twa Pygmies, and other forms of tribute-paying relations, as well as engaging in silent trading with each other. The Bantu Expansion would ultimately reach as far as the Siddis of South Asia, if not further, perhaps following a much earlier expansion of Congoids. Some of the Bantu men would enslave Pygmy, Capoid, non-Bantu Negroids, and rival Bantus into slavery primarily to Berber, Arab, and Jewish merchants, who would establish a slavery stronghold in North Africa along the Barbery Coast. Nobody was safe from the slaving of the Barbary pirates, as many whites would be enslaved, as well, and sold to non-Christians of the Mediterranean.

The Nilotic Dinka and Maasai people have among them the tallest people in the world. They are typically cattle herders, living from the wealth of their herds. Being Nilotic or Sudanese peoples, they have features in common with Indo-Eurafricanoids, probably resulting from ancient Levantoid roots. They speak the Swahili language, a form of Bantu.

The Hadza of Tanzania are a people who speak a language isolate, though it has been classified with the Khoisan at times because of its use of clicks, probably a result of hybridization. They are egalitarians with no government, living in a network of bands. The Hadza hold that there were various stages of humanity, or at least of Hadza, beginning with hairy giants called *Akakaanebe*, who ran down their prey by way of exhaustion, a practice known as *persistence hunting*. They were followed by another stage of humans, cavemen who were still giants, but less hairy, and hunted with dogs and cooked with fire. Then came smaller people who lived in huts and made bows and arrows. This was followed by the Hadza themselves. The Hadza are also unique for the genuine mutualism that they have evolved with a bird, the *Honeyguide*, that assists them in finding honey, eating what they leave behind.

African peoples would long be known as *Negroes* or *Negroids*, deriving from the Latin for "black," with Nigeria having taken its name from the Niger River, itself named by an Italian. Nigeria is a contender for the home of African phenotypes commonly labeled *Congoid*. Alfred Cort Haddon distinguished between West Africans and others, calling them "*Negroes*," as distinct from African Pygmies, which he calls "*Negrillos*," and other Congoids, Negroids he calls "*Bantus*." These Negroids in West Africa who

[1067] Coon[1], 590

are distinct from Pygmies and Bantoids, he suggests, are markedly good traders, often have their front incisors removed, and are often participants in secret societies, being animistic fetishists and ancestor-worshippers. They are also being known for making music with drums and guitars.

In Nigeria, on the West coast of sub-Saharan Africa, there is a people called the *Yoruba*. These people have many similarities with North Africans, such as the Berbers in Mauritania and Morocco, and Berber, Arab, and European people more generally, especially in regards to some of their religious beliefs, social organization, and philosophical outlook. The Yoruba people live in a highly-organized society for a sub-Saharan African people, and have done so for a long time, possibly being remnants from Atlantis. They are believers in a Sky God, much as the steppe peoples of both North and South Eurasia are, and hold to the view that the monarch, a "Bringer of Light," is also divine. Having some Eurasian admixture from around the time of the original Bantu expansions and a green Sahara, they trace their origins orally to a traveling king who founded their people near the Niger River, but are not a Bantu-speaking people. This may have been just before the time that the Capoid people started moving Southward and Eastward toward South Africa, from their original home in the green Sahara, themselves likely displaced by the drying of the Sahara and the continuation of the Bantu Expansion, perhaps a result of Israelite presence in Africa. It does, nonetheless, share in the category, with Bantu, as a Niger-Congo language, and, as such, may be a representative of the impact of early speciation of Congoids from African Pygmy populations, which is understood, by people such as Carleton Coon, to have occurred when certain Pygmies had taken to the edge of the jungles, practicing horticulture, thereby joining in on the Neolithic. For the Yoruba, philosophy is understood to precede religion, as religion is understood to be founded upon philosophy. They practice secret societies that guard moral truths administered to initiates. They have also engaged in Voodoo, fetishism, cannibalism, and tooth ablation.

The Dogon are another West African Negroid people who neighbor the Yorbuba. They are notable for their fraternities of circumcised men, called *Awas*, and their men-only, secret language. They practice circumcision of both the men and the women, cutting the foreskin of the penis off of the man as an act of removing his femininity, in the belief that foreskin is like the labia of a vagina, and removing the clitoris of the women with the excuse that it is like a penis, an impurity of their femininity. These practices of strong sexual polarity are likely to have arisen in Africa during the Neolithic. They stand in contrast to practices of their other neighbors, the Igbo—pronounced *Heebo*—, who Chris Knight had pointed out formed sororities against the men, likely a more ancient practice than that of the Dogon, inherited by the Igbo, as Knight points to Paleolithic evidence such as cave art, and it is likely that, following Coon, the direct ancestors of the Igbo had not yet developed into *Homo sapiens* at this time, unless those ancestors were Mechtoid. This may be the case for some of the Yoruba, who continue the tradition of tooth ablation inherited from Mechtoid, though they display Congoid characteristics, while Mechtoid is considered to have had Mediterranoid features, suggesting the inheritance is largely, though possibly not exclusively, cultural. It is probable that, considering the physical anthropology of Negroids, that they are a branch of Congoid derived largely from African Pygmies, as suggested by Coon.

The *Leopard Society* was a secret society in West Africa (Sierra Leone), sometimes called the *White Man's Grave*, which would dress as leopards and cannibalize unsuspecting victims, apparently being in a state of "possession" and believing themselves to literally have transformed into leopards. The Crocodile society, also in West Africa, including Sierra Leone, was very similar.

Some anthropologists have pointed to the recent evolutionary and Western arrival of Congoids as a source of social tensions in the West. *Erectus Walks Amongst Us*, by Richard D. Fuerle, for instance,

follows Carleton Coon in suggesting that Congoids evolved separately in sub-Saharan Africa, believing this to affect such things, among others, as neonatal and brain development, resulting in differences in sexual dimorphism and behavior from Indo-Eurafricanoids and Mongoloids as well as differences in intelligence. Indo-Eurafricanoids, who Fuerle refers to simply as "*Caucasians*" or "*Europids*," are the highest in sexual dimorphism, fall slightly behind Mongoloids in skull capacity and intelligence, and tend to be individualistic family-oriented types. Mongoloids have the lowest sexual dimorphism, are the most intelligent, and are highly collectivist and communal-minded. Congoids have a sexual dimorphism approaching Indo-Eurafricanoids, are far less intelligent, and are very tribal. [1068]

Perhaps most important, in regards to founding sociocultural differences between Congoids and Nordids, is the differences in sexual relations between the two. While similar in sexual dimorphism, suggests Fuerle, Nordid males have fewer *superfluous traits*—those that exist only by being favored through sexual selection, otherwise being detrimental, like a peacock's plumage— than do their Congoid relatives, owing to Nordid men having the upper-hand in sexual bargaining while Congoid men tend to have less sexual bargaining power due to their mating strategies, wherein women have more bargaining power. Some of the superfluous traits in Congoid men, for instance, are large penises and testicles, as well as strong body odor. Nordid women, on the other hand, have more superfluous traits than do Congoid women, such as pronounced gracility and more contrast between the waist and the bust and hips. Referring to non-Congoids as *Orientals* because of a belief that they share origins in West Asia, and Congoids as *blacks*, Fuerle suggests that "[w]hile the female genitals in Orientals are 'front and high'" and "erections in Orientals are 'parallel to the body and stiff,'" "blacks are 'at right angles to body and flexible,'" and "'back and low.'" Nordids tend to mate frontally, while Congoids, suggests Fuerle, do more "doggystyle."[1069]

These biological differences accompany different reproductive strategies between Congoids and Nordids, namely *K*— "fewer children, more childcare"— and *R*— "more children, less childcare"— strategies.[1070] Tropical animals tend toward an *R* reproductive strategy, so naturally, suggests Fuerele's work, Congoids, who developed in the jungles and along the forest edges of Central Africa, tend toward more of an *R* strategy, which does not create as strong of pair-bonds. Mongoloids have the strongest *K* strategy, while Indo-Eurafricanoids tend to *K* but less strongly. As a result, suggests Fuerele, Congoids tend to be less motivated by interpersonal love than are their Nordid and Mongoloid relatives. [1071]

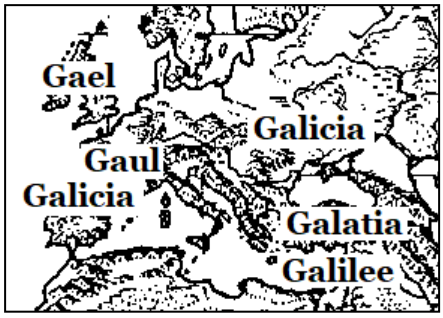
Part of this dynamic may go back as far as the sexual differences between Asian and African Great Apes, perhaps also involving a third component with some American influence as may have influenced the New World Monkeys, some of which are even polyandrous, but which mostly distinguish themselves otherwise by their strong tendency toward monogamous pair-bonding, lacking in Old World Monkeys. Such an influence may have been ecologically-influential on archaic humans evolving in the Americas, and may have been passed along to Europeans by way of the Solutreans or the Ancient North Siberians (Yana). Men seem to have revolted in the Americas by forming into secret brotherhoods that would don masks and police the community, pretending to be spirits, a practice among the Selk'nam and Yamana that would lead to an increase in their sexual dimorphism. The women and children were never let in on the secret that the spirits were actually men in their community or friends of it. Similar practices to these can also be seen in the Duk-Duk secret society of the Tolai people of New Guinea. These sorts of

[1068] See Fuerle
[1069] See Fuerle
[1070] Interestingly, the Barbary Ape, which used to extend to England, a native European Old World Monkey, is known for a *K* strategy. Males and females both parent, a condition called *alloparenting*, with even males spending hours with, including carrying, the young.
[1071] See Fuerle

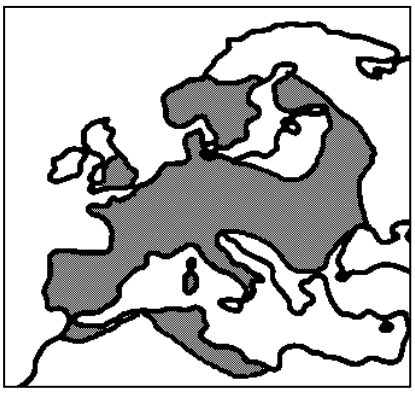
ideas would make their way into Europe as well, where they would not have the leveling affect against the influence of women empowered by an American ecosystem, but would tip the scales in favor of a return to patriarchy.

Celts and Germans

Celt and *German* refer to Indo-European ethnic groups that are, themselves, amalgamations of prior ethnic groups that converged together and diverged from one another in the process of their evolution, much like their predecessors.



The Celts have been associated to various cultures, including Old Europe such as the Danube Valley and Trypillian cultures, the Neolithic Basal European or early Alpinid Beaker people (coming from out of Anatolia), the Aryan Tumulus, Urnfield, Hallstatt, and La Tene cultures (which developed natively, though not indigenously, in Western Europe), and Scythian groups, such as the Cimmerians, which pushed Eastward from the Steppes. Rather than one of these being the case, it is likely that these competing views tell us a story of what happened, that the Celts were a fusion of different cultures. These cultures would mature into Celtic tribes sucb as the Britons, Boii, Celt-Iberians, Gauls, Gallaeci, Galatians, Lepontii, and others. The name *Celt* is originally derived from Herodotus, who referred to the Celts as the *Keltoi*. Julius Casesar said that the Celts called themselves by this name, *Celtae*. Strabo considered the Celts to be oriented largely around the Alpine Mountains, though at times in the surrounding plains, and also throughout Western Europe and in parts of Southern Europe, including especially in what is today Spain. Celtic languages would be subsumed largely into the Romance or Gallo-Romance languages, including French, Portuguese, and Spanish,[1072] among others, as well as into Germanic. The Celtic and Roman languages were so closely related at their point of origin to be grouped together into the Celto-Italic language family (which includes Spanish), their split likely having occurred around the Urnfield Culture that gave way to the Celtic Hallstatt and the Italic proto-Villanovan culture.



Similar to the Celts, the German peoples have been variously described as coming from Beaker Peoples, and Pitted and Corded Ware, as well as from Yamnaya, taking form as the Battle-Axe Culture, Jastorf, and etc., but also as having come from migrating Scythian-derived tribes such as the Saka, Getae, and etc., taking the form later of Goths and Alans, Saxons and Jutes, and all that lies inbetween. Tacitus gives a mixed account of the origins of the Germans. In one breath he says that "the Germans themselves were an inidigenous people without any subsequent mixture of blood through immigration of friendly intercourse," mistakenly suggesting that it was only by sea that people travelled and that people way

[1072] To reiterate, the Spanish language is a close relation to Celtic and Italic, in fact being a Romance language, a derivative of Latin, the Gauls of Iberia having also been a Celtic people. Languages of the Gauls and of the Romance-speakers would be united again in the Gallo-Romantic fusion of languages.

back when would not have travelled by sea to the wilds of Germany. In another breath, it's "the name *Germany* [...] is modern and of recent application, since those who first crossed the Rhine and expelled the Gauls, and who are now called *Tungri*, were then named *Germans*," suggesting that a tribal name became a national name out of the fear that it spread. Indeed, according to Strabo, it was the Rhine which separated the lands of the Celts from those of the Germans, who "differ little from the Celtic race, except in their being more fierce, of a larger stature, and more ruddy in countenance," but who are "in every other respect, their figure, their customs and manner of life," "such as we have related to the Celts." Germanic people especially, synthetic in nature because established from a convergence of the kin-shattered of different lands—the Hebrews, Scythians—, had become marauders, slavers, mercenaries, etc.[1073] Germans, or Nordics more widely,[1074] may share a similar heritage, if not the very same, as the prefix *ger-* means to "bring together," leaving *German* to mean "bring men together," likely referring to men who would otherwise be separate, belonging to different kinfolk.[1075] Indeed, Western Europeans have a large propensity to express different genetic characteristics, as with a large variety of eye and hair colors. Julius Caesar, however, had suggested that the name *German* was already in use by other tribes, before the Tungri.[1076] *Tungri* may have some relation to the word *Tengri*, referring to the god of the Mongols and Turks, though it may also mean "speakers," derived from the Germanic word for "tongue."[1077]

The Celts, in composing an earlier wave of European, may be more related than the Germans to the earlier Beaker and Yamnayan waves than those of the Scythians, though later form of Celts derived from Scythians, too. The Celtic people also started to form an Aryan substrate to later waves of Germanic peoples in a similar way that the Neolithic farmers had composed the substrate to the Yamnayan-derived peoples. This being the case, the middle waves of Celts, following the original wave of Aryans, may be understood to be derived from more Thracian roots, while the latest waves of Celts and the Germans, coming even later, might be considered more to derive from the Thracian-derived Scythians. There is also strong relationship to be stated between the Greeks and the Thracians, and between the Celts and the Thracians. These peoples were not entirely separate. Greek mythology and history is full of Thracian influences. Similarly, the Celts and Thracians shared much in common culturally, such that it is possible to speak, to some extent, of a Celto-Thracian or Thraco-Celtic cultural

---

[1073] Germans were also followers of Nastika beliefs, whereas the Celts had maintained a Druidic priestly order similar, in some respects but not others, to the Brahmins in India

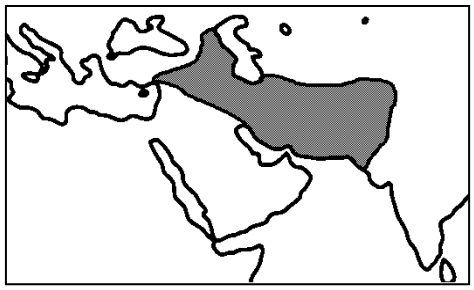
[1074] Among them the Scandinavian, Saxon, Jute, Dane, Angle, Frisian, Frank, Swiss, and many other people

[1075] Sometimes *German* or *Dutch*, the name of the Germans for themselves, or otherwise *Teuton*, is related back to *Almain* or *Alemanni*, which means "all men," a reference to a coalition of varying peoples. Perhaps this also has some relation to *Aryan* and *Alan*.

[1076] He describes the Germans as worshipping Mercury primarily, and of even giving human sacrifices to it.

[1077] Among the Tungri may have been the Eburones. Eburones, a Belgic tribe, were named after the Yew Tree, *eburos*, which suggests that they may have been early Jews, as *Yew* is another word for Jew, *y* and *j* often being philologically interchangeable, and *Eburo* being basically *Hebrew*. *Yew* has also been associated with a boar deity, which has been proposed as an alternate source of the tribal name. The Eburones were said to be under the protection of the Treveri, another Celto-Germanic (Belgae) tribe, at times allied with or friendly toward the Romans, to the South, who would be superceded by or perhaps assimilated by the Franks, a tribal confederation, perhaps named after a leading family, who would come to dominate the Rhineland. Caesar desired to annihilate the Eburones, and they disappear from history after the end of the Gallic Wars between Gaul and Rome, perhaps becoming the Tungri or being assimilated by them, as suggested by scholars such as Robert Nouwen, and then by the Franks. The Franks were said variously to have come from Central Europe, around Hungary, from areas inhabited by Scythians or Huns. It seems that the Eburones, a Beglic or Rhenish tribe composed of both Celtic and Germanic sources, along with other tribes, may have adopted a Hunnish Tengrist philosophy that enabled them to look past their differences, forming the Tungri as a result. After all, Atilla had fairly recently established his Turkic empire in Hungary, pushing many of the Germanic tribes of the area, including Goths, out. And this would not be the only connection between Hebrews and Tengrism, as the Khazars, also derived from Huns and other Turkic tribes, were also Tengrists, known to have converted to Judaism.

"empire." In a very similar way, the Thracians relate to the Scythians. One may speak, though not linguistically, of a Thraco-Celtic or Celto-Thracian culture, uniting the post-Yamnyan Aryans into a larger group, and this may even extend as far as the Tocharians[1078] of the Tarim Basin near Tibet in China. The "Celtic Empire"— not so much a political empire as a cultural zone—, if the Thracians and Tocharians are included, ranged as far as the Picts in Scotland to Gauls in Spain and to Galatia and Galilee in Anatolia and Israel to the Tarim Basin in China. Linguistically, the Celts seem to have been influential from Scotland to Galatia and Galilee.



Of course, the Iranic peoples are also of close relation to the Celts and particularly the Germans. Iranics are, after all, partially-descended from Thracian, Scythian, and Germanic peoples, speaking an Indo-European language that had itself contributed toward the Germanic languages. They are especially associated with the Sarmatian or Samaritan wing of the Scythians, though they also had some interplay with the Germanic Saka and the Goths or Getae. Despite their stronghold in Iran, the Iranic languages actually originate in Siberia among peoples such as the Sintashta or Andronovo, and were spoken by Siberians such as the Saka and perhaps the Wusun.

By way of groups such as the Beaker People, Scythian-derived tribes such as the Belgae, and by looking at the placement of early proto-Celts in present-day Germany, we can see that the Celtic and Germanic peoples overlap to an extent that cannot be ignored. The Celtic and Germanic peoples come from a common heritage, share a familial relationship, [1079] and may be the actual Hebrew peoples of the *Bible*, who had become the Phoenicians, Judahites, and Israelites, and then Radhanites and Scythians, before becoming Celtic and Germanic superstrate, or people of Europe more widely. The Irish have claimed to have come from Hebrews as well as Aryans. Both the Celtic and Germanic peoples have claimed to be Israelites. It is clear that the Celtic and Germanic peoples, considered to be Hebrews or Israelites, derived a lot from the Mediterranean cultures, and especially the Canaanites. Remember, Phoenician and Viking ships are virtually the same vessel.

The ruling class of Iron Age Europe, among them the later waves of Celts and Slavs but especially the Germanics, were Eastern in origin. But they became the ruling class of prior *Chalcolithic*, or "Copper Age," and Bronze Age waves of Easterly peoples, who sprang from Yamnaya, Corded Ware, Beaker people, and related cultures, who'd already displaced and assimilated Cro-Magnoid, and forced Alpinids and Basal Eurasians into slavery. For the most part, then, Germans and Celts are composed of a Cro-Magnoid and Alpinid substrate, sourced from Western and Scandinavian Stone Age hunter-gatherers and Neolithic farmers such as the Beaker People, an Aryan proto-Nordid substrate from Steppe Herders such as the Yamnaya, with a superstrate laid atop them of Nordid Scythians,[1080] themselves something

[1078] Who were found wearing tartans, similar to Celts and Thracians

[1079] This relationship can also be seen between the Celts and Italians, and between the Celts, Germans, and Thracians, Dacians, and similar Aryan groups, from which the Scythians were ultimately derived, or between these and the Greeks. I think what we are looking at is the manner in which the stratum is laid, with homegrown Western European Celts and Germans, derived from the Halstatt and Battle-Axe People, for instance, being overlaid by very closely related groups, such as the Scythian, Iranic, and Germanic-speaking Goths, Alans, Saka, and etc. from whom the Jutes, Saxons, and others are at least in part derived. These more Easterly tribes would travel Westward, conquering peoples and becoming their rulers.

[1080] The Germanic people and later waves of the Celts from the Scythians and the wider Scythian cultural complex would include groups such as the Cimmerians, Sarmatians, Getae, and etc.

of a reinvention of the Yamnaya.[1081] Together, the lower class, nativistic substrate, and the upper class, foreign but related superstrate, would compose the Belgic, Germanic, and Celtic, and even Italic peoples of Western Europe and, closer to the Pontic Steppe and the Balkan homelands, the Greek and Slavic peoples of Eastern Europe, *Slavs* being the closest to the source of Yamnayan and Scythian peoples (outside of Caucasians, perhaps).

The tendency is for the development of the ruling class to be linear and migratory, while for that of the lower class it is for it to be circular and sedentary. This creates an evolutionary dynamic by which localized hybridization and convergence is scattered by nomadism. Furthermore, ruling classes tend to be able to trace their geneology in a more linear fashion, while lower classes will tend to derive their geneaology from a wider source, as a matter of the differences in evolutionary dynamics. For this reason, ruling class geneaologies such as those found in *The Bible* are presented in a linear fashion, whereas many common people are not aware or concerned with their place of origins or the people who contributed to their DNA or where those people came from, being quite a bit to keep track of. Ruling classes tend to live according to rules regarding who they can breed with and not, and they tend to follow the male line, or to be patrilineal. Thus, males, in sequence, and breeding with relatives, will be documented in the geneaology, but the males contributing to relatives may not always themselves be related, they are merely ignored, similar to the manner in which common people tend to ignore their geneaology as a whole. Thus, the linear element is emphasized. This, however, is less true of ruling classes, who are more likely to have relationships such as *moiety*, but, even so, genes still make their way through the chain, as caste and class divisions are rarely kept entirely pure.

The Romans had long maintained a cultural preference toward the Celts in comparison to the Germans, who they saw as especially barbaric. Within Celtic and especially Germanic cultural groups, competing families, clans, or "houses" of nobles and royals would establish competing tribes, kingdoms, and empires, typically within geographically-defined "countries," continuing the Scythian tradition of infighting and internal power struggles. These belligerent struggles, however, would bleed into a mutual disliking for the Roman Empire, which the Scythians would ultimately be responsible for toppling. The Germanic and Celtic peoples, at the time of the collapsing Roman Empire, were composed of a homegrown (proto-Nordid) Crog-Magnoid, Alpinid, and Aryan substrate— who were the peasants and artisans, primarily—, and a related but foreign Nordid nobility and royalty sourced from the Scythians. The bottom-up culture— derived primarily from the Cro-Magnoids and Alpinids, who would become the peasantry and artisan classes— was established locally, and was related to Old European languages such as proto-Gaelic, Pictish, and Basque, especially Vasconic languages. These substrates would become overlaid by a superstrate of Aryan Celtic languages such as Breton, Gaelic, and etc., and then this would be overlain by one of Iranic-Germanic languages, such as Dutch, English, Scot, Frankish, and German, coming from a foreign ruling class governing as Nordid nobles and royals.

Kingdoms of many kinds, derived from the Celtic and especially Germanic peoples (as well as from related ones) warred with one another to become empires, such as that of the Frankish Empire and its successors, the Carolingian and Holy Roman, and those of the Portuguese, Spanish, Dutch, and English empires. All of these represented Nordic control of, or influence on, the royalty and nobility, even if not employing the Germanic language (as was the case in France, Spain, and North Italy). The development of empires took a long time, and for a long period beforehand the various states of Europe were micronations under the control of families, and clans and tribes sometimes united into confederations, or otherwise engaged in various treaties with one another. There is much that can be expounded upon

[1081] There would also be some Cro-Magnoid and standard Mediterranoid in the substrate, but this was a super-substrate, upon which the Aryan had already been laid

in this regard, as the conflicts are long and enduring, and countries and ethnic groups come and go; but for the sake of a work like this, it must be kept within the realm of general understanding, that the states of Europe had not yet formed into Empires, nor into nation-states as exist today. Instead, states were generally chiefdoms and monarchies, with some republics and communes that popped up now and again between them. These monarchies generally adhered to a religion for their ideological support, but otherwise family loyalty and fealty would serve as the ideology within a given *country*, usually defined geographically along with sentiments of locality and ethnicity. People did not generally fight, as they do today, for a republic or for universal political rights, but over the heirship to the throne, or against oppressive actions taken by the state such as taxation, or against invaders considered to be foreign to the country. Modern political ideologies did not exist to unite people until the Enlightenment.[1082]

As the Greek, Roman, and Hebrew societies are associated with ancient history of their own account, but the Phoenician, Celtic, and Germanic peoples are still somewhat mysterious, and because these latter overthrew Rome, with the Germanics especially to become the ruling people of Europe, the Phoenician, Celtic, and German people will receive an undue amount of attention moving forward. This is in order that we may consider the origins of our most recent ruling class, which will be important as we consider political events from more recent history, particularly those surrounding World War II that led us into our contemporary, postmodern condition.

Iron Age Society

The Iron Age was brought to Europe when the Germanic peoples had brought iron-making technology from out of Southern Asia.

Traditional European governance during the Iron Age (still practicing agriculture) took on many forms, but tended to work along the lines of tribal or clan rule. Germanic and Celtic peoples often tended toward some form of largely decentralized leadership, such as that of the Godi or Gothi, the Lawspeaker, or the Chieftain. Oftentimes, cases can be made for voluntaristic and democratic elements to the rule of barbarian leaders, through assemblies such as Things or in Heathen Hofs (Houses). But this was often limited to a certain strata within society. Many of the oligarchical clan structures, which did allow for democratic participation amongst the nobility, warrior, or elder classes, would eventually give way to the concentrated power of kingships (these eventually gave way to republics and empires). Regarding the social or political arrangements of the Germans, Tacitus tells us that

> Concerning minor matters the chiefs deliberate, but in important affairs all the people are consulted, although the subjects referred to the common people for judgement are discussed beforehand by the chiefs. Unless some sudden and unexpected event calls them together they assemble on fixed days either at the new moon or the full moon, for they think these the most auspicious times to begin their undertakings. They do not reckon time by the number of days, as we do, but by the number of nights. So run their appointments, their contracts; the night introduces the day, so to speak. A disadvantage arises from their regard for liberty in that they do not come together at once as if commanded to attend, but two or three days are wasted by their delay in assembling. When the crowd is sufficient they take their places fully armed. Silence is proclaimed by the priests, who have on these occasions the right to keep order. Then the king or a chief addresses them, each being heard

[1082] However, there were movements that can be considered proto-Enlightenment, such as the Renaissance and Reformation, that did start to have republican sentiments, though these had not yet established themselves as a norm

> according to his age, his noble blood, reputation in warfare and eloquence, though more because he has the power to persuade than the right to command. If an opinion is displeasing they reject it by shouting; if they agree to it they clash with their spears. The most complimentary form of assent is that which is expressed by means of their weapons.
>
> It is also allowable in the assembly to bring up accusations, and to prosecute capital offenses. Penalties are distinguished according to crime. Traitors and deserters are hung to trees. Weakling and cowards and those guilty of infamous crimes are cast into the mire of swamps with a hurdle placed over their heads. This difference of penalty looks to the distinction that crime should be punished publicly while infamy should be hidden out of sight. Lighter offenses are also punished according to their degree, the guilty parties being fined a certain number of horses or cattle. A part of the fine goes to the king or the tribe, part to the injured party or his relatives. In these same assemblies are chosen the magistrates who decide suits in the cantons and villages. Each one has the assistance of a hundred associates as advisors and with power to decide.
>
> They undertake no business whatever either of a public or a private character save they be armed.

Among the European pagan societies, Indo-European concepts of personal responsibility and honor had prevailed. One Germanic concept of importance to the development of Mutualism is that of *frith*, or the inherent obligations of friendship. Such concepts would go on to inform the frith guild and other practices such as the kindred, which were established for the promotion of peace and the establishment of law and order, especially in Saxon society. Legal scholar, Bruce Benson, writes that the "primitive German tribes from which the Anglo-Saxons descended had kinship as the basis for reciprocal recognition and enforcement of law," and that the "kindred was reciprocally responsible for protection and for pursuit when an offense occurred, and successful pursuit resulted in payment of restitution defined by a system of *wergild* or man-price (*wer*)."[1083]

The common law tradition grew from out of customary law, which itself grew from out of customs that carried the force of law (such as the custom not to kill others). The customary law of pagan Europe might be summed up by the phrase "Harm ye None," basically a statement of non-aggression. Common law was essentially a codification of customary law, the turning of custom into a precise rule that would be remembered by people such as lawspeakers, whose duty it was to remember and recite the law, not as they made it, but as it had been arrived at through judgements made in courts. These judgements, whether by a judge—as with the ancient Israelites— or by a jury—as with Saxon common law—, served to establish a *precedent*, a ruling that would be considered, and typically adhered to, by later courts. However, judges and juries had the power to stray from precedents, should they decide that the ruling was an unfair one. In this way, while having had considered the old precedent as it might have been recited by a lawspeaker, a new precedent would be established, which would then be considered by courts of the future.

The purpose of the common law court, properly understood, was not to impose artificial rules, but to discern, as a serious group effort, rules or consequences from Nature. These would be artificially stated, of course, but with the goal of stating them as close to the ruling discerned from Nature as is possible. Common law, then, is an attempt to approximate natural laws. This was in order to mitigate the costs of senselessly, without any forthought, going against the way of Nature. By predicting the likely outcome, the costs of violent conflict could be foregone. Court was not established to simply dominate, but to

[1083] Benson, 22

come to mutual understandings and mitigate problems. Only later was there a mutual understanding among the members of the court, that together they could dominate those without courts or who were otherwise less organized. As Emma Goldman recognized, in "Anarchism: What it Really Stands For,"

> natural law is that factor in man which asserts itself freely and spontaneously without any external force, in harmony with the requirements of Nature. For instance, the demand for nutrition, for sex gratification, for light, air, and exercise, is a natural law. To obey such laws, if we may call it obedience, requires only spontaneity and free opportunity. That governments do not maintain themselves through such harmonious factors is proven by the terrible array of violence, force, and coercion all governments use in order to live. Thus, Blackstone is right when he says, 'Human laws are invalid, because they are contrary to the laws of Nature.[1084]

Typically a common law court might involve a group that meets as a Thing together, outside— Saxons had apparently allowed their middle and lower classes to participate in, and to have a voice in, assemblies—, though it may also involve someone like a *Gothi*, whose court was run privately, though nonetheless somewhat democratically—in order to maintain members—, and whose members were voluntarily contracted with the *Gothi*[1085] as their provider of law, not entirely unlike the Kapauku and their relationship to their *Tonowis*, some that Bruce Benson has pointed out in *The Enterprise of Law*. This sort of voluntary association helped to ensure that courts did not step outside the bounds of Reason as comprehended by the members of the court, who could leave if things started to get too unreasonable. However, leaving a court made one unprotected by that court, and so it would be necessary to subscribe to the service of another Thing or Hof, so that one would not be an outlaw altogether. An *outlaw* was anyone who did not have the protection of a court, and so who was outside of the law—did not have protection contracts—, and so was able to be killed or enslaved without formal recompense. An individual who was banished from a tribe, who murdered someone, who did not show up to court, or for a number of other reasons, might be declared an outlaw by a court. If that individual had a contract with another court, they would receive protection from that court. However, courts that believed their own members to have wronged members of another court, which was in pursuit of the member, might hand them over for the sake of keeping the peace between courts. In order for a court ro decide that bearing the costs of conflict was worth it, that court would have to believe that it was politically expedient or a matter of justice that the individual in question receive the protection of the court. That protection eventually included the enforcement of the *due process of law*, the official procedures that needed to be undertaken to prosecute someone under the law. Due process of law involved a jury trial by one's peers. This originally meant people who actually knew the person being tried. Judgements would come to be based upon a standard of the "reasonable man," an abstraction of what someone with socially-acceptable standards might do in a given situation.

In common law practices, there are no behavioral dictates. One does not have to follow laws about the way one behaves. Rather, as was traditional pagan sentiment, one must keep from causing harm to others, as by hurting their body or causing loss of property. Taboo behavior was seen as distasteful, but not unlawful. However, if one was rich enough to afford it, one could buy the life of another who annoyed him, by paying the man-price. Dueling was also a common practice among common law societies. Man-price and lawful dueling worked to ensure that interpersonal interactions were generally polite, especially between equals or, as class distinctions grew more fierce, from peasant to noble. Nobles could afford the man-price, and even a wrong word with an equal could get one into a duel over the honor of the offended individual.

[1084] Goldman

[1085] Meaning *God*

In contrast to the ways of the barbarians, *classical antiquity* would refer to the time in which the Ancient Greek and Roman civilizations had established themselves as the dominant forces and major cultural influences in Europe. From this time period, much of the European world has derived a great deal of its cultural, aesthetic, religious, philosophical, political, legal, and economic ideas. In Ancient Greece, Plato and Aristotle, among numerous others, had established schools of philosophy that would continue to be of perennial importance even to this day, millennia later. Ancient Athens, home not only to Plato and Aristotle, but to many great Greek philosophers, was also one of the world's first known directly-democratic city-states, while the Roman Republic had practiced a large-scale republic based on Greek principles. Roman society would produce many of the great neo-Platonist, Stoic, and skeptic philosophers. As with the Celtic and Germanic peoples, the Greeks and Romans concerned themselves with conceptions of natural laws, but did so more secularly and rationally. Rudolf Rocker says that

> Under the pressure of the ever encroaching social inequalities within the Greek city-republics there had arisen in the fifth century before our era the doctrine of "the state of nature," sprung from the belief in a traditional "Golden Age" when man was still free and unhindered in the pursuit of happiness before he gradually came under the yoke of political institutions and the concepts of positive law arising therefrom. From this concept there developed quite logically the doctrine of "natural rights" which was later on to play so important a part in the mental history of European peoples.[1086]

He says that

> The loftiest conception of natural law was formulated by the school of the Stoics, whose founder, Zeno of Kittion, rejected all external compulsion and taught men to obey only the voice of the "inner law" which was revealed in nature itself. This led him to a complete rejection of the state and all political institutions, and he took his stand upon complete freedom and equality for everything that bears the human form.
>
> [...]
>
> Man's social instinct, having its root in communal life and finding in the sense of justice of the individual its completest ethical expression, Zeno combined, by sociological synthesis, with man's need for personal freedom and his sense of responsibility for his own actions. Thus he stood at the opposite pole from Plato, who could conceive a successful communal life of men only on the basis of a moral and intellectual restraint imposed by external compulsion, and who in his views was rooted as deeply in the narrow limits of purely nationalistic concepts as was Zeno in his concept of pure humanity[1087]

Greek and Italic Mediterranean peoples tended more toward centralized city-states than their barbarian Nordic and Alpine counterparts, and eventually to large republics and empires, such as the Greek and Roman Empires. Athenian society emphasized popular control of the *polis* and the participation of the elite in politics. Roman society emphasized the public interest, and the rule of civil law, making private property a civic matter of state law, and not just a personal affair protected through allegiances and in relation to one's caste. Civil law would come to differ from common law in many important respects. Most importantly, it was not law based upon precedents informed by customs that were interpreting the rule of Nature, but was active, statutory law, intent on making individuals conform their behavior to the dictates of the rulers, typically a senate. Senators would legislate laws, which had to be obeyed. It was, nonetheless, public law, and so republican law, even if oligarchical. The difference between common

[1086] Rocker[1]
[1087] Rocker[1]

and civil law might be understood to be a difference of descriptive and prescriptive law, as common law is law established by way of addressing facts, while civil law is the attempt to prevent facts.

While Athens was truly democratic in many respects, and while the Roman Republic was truly republican in others, it must be remembered that such mutuality as one may presume of a democracy or republic was not universally applied. In both Ancient Athens and the Roman Republic, one could not participate in the democratic process unless one was a member of a given class, such as by being a native, adult male, militarily-trained citizen, as in Athens, or such as a Patrician, an aristocrat of Roman society.[1088] Classical antiquity would eventually fall to the interests of competing "barbarians,"[1089] who would largely bring back traditional European governance in what has been called the *Dark Ages*. These barbarians included the various Germanic, Celtic, and Iranic peoples, Phoenicians, Jews, and others. Henry George says that

> Unfortunately, inequality, once produced, always tends toward greater inequality. This struggle — between equal rights to the soil and the tendency to monopolize it in individual possession — caused the internal conflicts of ancient Greece and Rome. But the final triumph of the tendency toward ownership eventually destroyed both.
>
> By the power with which the great attracts the less, small family estates became part of the great estates — the latifundia — of enormously rich patricians. The former owners were forced into slave gangs, or became virtual serfs. Others fled to the cities, swelling the ranks of the proletariat, who had nothing to sell but their votes. As a result, population declined, art sank, the intellect weakened, and once splendid civilizations became empty shells.
>
> The hardy virtues born of personal independence died out, while exhaustive agriculture impoverished the soil. At length the barbarians broke through; a civilization once proud was left in ruins. During Rome's grandeur, such a fate would have seemed as impossible as it seems to us now that the Comanches could conquer the United States or Laplanders desolate Europe.
>
> The fundamental cause was tenure of land. On the one hand, denial of the common right to land resulted in decay; on the other, equality gave strength. Every family in the German villages was entitled to an equal share of common land. This impressed a remarkable character on the individual, which explains how small bands of barbarians overran a great empire. Rome perished from "the failure of the crop of men."[1090]

Modern thinkers would come to learn much from the philosophy coming out of ancient society and classical antiquity, from Plato and Aristotle on to Pyrrho and Zeno. They would also retain sentiments of paganism, Christianity, and its associated heresies (but they would remain critical of ecclesiastical authority and dogma). Also, they would learn from Greek and Roman political structures, involving honest attempts among the privileged classes and philosophers at providing themselves democratic and republican forces in government. These ancient attempts at democracy and republican government would be revived in the Renaissance as new attempts at classical democracy. Such attempts would be prominent in free townships and communes or city-states, merchant republics and confederations, in fraternities and guild halls, and amongst the rebels of the sea— pirates—, and would go on to influence workers' Mutualism as well.

[1088] Democratic and republican notions had been widespread since their practice in Athens and the Roman Republic, and actually existed long before in tribal governments

[1089] The Fall of the Western Roman Empire was accompanied by a pandemic called the *Plague of Justinian*

[1090] George

Iron Age economy would allow for the establishment of major trading centers and giant networks. Among the most important of these to Western European society would be the Hanseatic League, which reached from Scandinavia to Venice, ultimately growing from out of the Amber Road and the efforts of the Phoenicians and Vikings. The Hanseatic League was a mutual aid network established between various member-states. Participating maritime city-states had banded together for the sake of promoting trade and, despite having come from them themselves as Vikings, fending off pirates. It is the Hanseatic League, perhaps, which really represents the transition toward modern capitalist political economy, largely as a development from the Phoenician or larger Canaanite ways. The Hanseatic League would become a major institution of usury in the late Iron Age.

Tibet

An author writing for the *Tibetan Review*, in "Tibetan civilization dates back thousands of years earlier than its recorded history?" writes that the "Tibetan civilization dates back thousands of years earlier than its currently known recorded history," pointing to archaeological evidence found at the Qulong Village site in Western Tibet. The anonymous author points to "perforated conch ornaments," important status symbols that basically amounted to currency in many areas, that "indicate frequent cultural exchanges between the Western part of the Tibetan Plateu and ancient South Asia." In South Asian cultures, conch shells were traded around like money, perhaps as declared by chieftains. The site also featured residential caves, buildings, and structures, including large boulders such as "can be found across the whole Eurasian continent," and in "the Northern steppes, they are especially common."[1091] This area in Western Tibet is home to Indo-European peoples, such as the Drokpa yak herders. As such, the findings at the Qulong Village site provide a connection between Indo-Europeans of the steppe, Denisovans, and probably also Sino-Tibetans. Later connections can be made to Mongols (such as Gushi Khan) and other surrounding peoples,[1092] perhaps, indirectly, the Tungusics (such as the nearby Manchurians, a steppe people).[1093] It may have involved the Sumerians and Hebrews, as well. This suggests, perhaps, a connection that plays into world politics even today, uniting elites from the Eurasiatic, Afroasiatic, and Sino-Tibetan cultures beyond their cultural differences, along the lines of class, holding to a synarchist or synarchic outlook. In terms of Western society, if Abraham of Biblical fame had come from Sumerians who, themelves, had a connection to the Tibetan alliance, this would explain his confidence in ransacking Israel.[1094]

Carroll Quigley holds that priests with some understanding of coming rains had influence over people down below the hills and mountains, an influence that would surely be held, also, in the hands of Tibetans, should they have been in the know. Perhaps they were the source of this wisdom.

The impact of Denisovans on Tibetans is such that many Tibetans are understood to have Denisovan genetics, much as the New Guinean highlanders do, for the sake of living at high altitudes and in the cold. The Denisovans, who were found with an intricate jade ring,[1095] seem also to have passed their appreciation for jade on to the rest of Asia, perhaps especially among the Sino-Tibetans— whose chieftains were often buried with jade discs, called *bi* discs, as a sign of their high status— or those of

[1091] N/A5
[1092] Such as the Oirat or Khampa people
[1093] Who never made it into Tibet but whose connection to synarchism, by way of the Qing dynasty, suggest a connection
[1094] And, if there is any truth to the uranium story, perhaps also the source of his using the material for political gain, as learned from Denisovans
[1095] Many archaeologists comment on the advanced technology that would have had been needed in its construction

the Phillipine jade culture. The Jade Road, similar to the Amber Road in Europe,[1096] was also an important economic route, on which jade was exchanged.

The influence of the Capoids should not go underconsidered. The phenotype of the Capoid is similar in some important respects to those of Mongoloids, as Coon points out, and we know that Mal'ta Boy and his people had traveled into Siberia, into Denisovan territory. It's also interesting that Coon suggests that the Capoids, who have some phenotypic similarities to Tibetans, had traversed the Tibesti Mountains to get from their home in North Africa to their current location in South Africa: *Tibesti* is awfully close to *Tibet*, and translates to the "Mountain People Mountains" or the "place of dwelling of the Mountain People." Like the Sino-Tibetan languages the Capoids— or at least the "Hottentots" (Khoikhoi), suggests Sydney Welch in "Hottentots"— speak monosyllabic languages, and these are defined by sharp gender distinctions.[1097] The similarity in name to *Tibet* is likely not a coincidence, but is likely to be philologically relevant in some way. Today, the Tibesti region is home to a warrior people called the *Toubou*, perhaps representative of a strong Levantoid and Basal European population, admixed with a thin superstrate of Berber (Mechtoid, Congoid, Arabid) and likely also some Capoid.[1098] While Capoids today tend to be caramel color, they are likely to have been much darker when inhabiting North Africa. Some Capoids, such as the San !Kung,[1099] tend at times to have a slightly reddened skin. Perhaps the !Kung are of some relation to Cain, the kings, and the kahns, their sometimes red skin being of some relation to *Adam*, the "red man."[1100] Perhaps they also contributed to the ruddy or even red skin of some Indo-Eurafricans (such as Alpinids, some Mediterranoids) and Native Americans. According to Diane Cole, in "The Khoisan Once were Kings of the Planet. What Happened?" the Khoisan were once the most genetically common population of humans.[1101] *Legends of the Lost Tribes*, by Aran Patinkin, presents a Samaritan (non-Jewish Israelite) man saying,

> Abraham did not have a family name [...] He was called Abraham the Hebrew. The language we speak is Hebrew. And not only us, but also the Jews descendents of the Judean tribe. This means that there is something beyond all this nonsense, of Jews, Samaritans... or Hotentouts.[1102]

I looked into a possible explanation for this odd interjection at the end, but nothing I could find turned up an alternative explanation. The Samaritan appears to be suggesting that Hottentots, or Capoids, have a central role to play in the conflict between Jews and Samaritans. There is also mention in the documentary of the name carry-over between the Samaritans and Jews in regard to *Cohen*, a priestly name found in both groups, perhaps of some relation to *Cain* or to *Khoen* or *Koin* as in some renditions of *Khoikhoi* (like *Khoe-Khoen* or *Khoi-Koin*). Many have mused over the mark that Cain would receive after murdering Abel, which God had put on him after his inability to endure his punishment. This mark was supposed to protect Cain. But what was it? Popular suggestions include the Jewish nose, slanted eyes, or those with a hood or fold on their eyes. However, these don't inherently supply any sort of protection from others. It seems much more likely that the mark has something to do with the

[1098] Some of these Berbers have been associated with a strong Cult of the Dead

[1099] Sometimes specified as a *Kalaharid*, a particular Sanid (as opposed to Khoid, as in *Khoi-San*) subtype of the Capoid

[1100] Another people, with only a minor Capoid substrate (peppercorn hair at times), is that Mountain Dama, who have been considered to have a bluish tone to their skin. Some Lapps have also been said to have a bluish tone. Some of the Indian literature speaks of early man having come in different colors, such as blue, red, yellow, white, etc.

[1101] Cole

[1102] Patinkin, 12:50

forehead wrinkles that many Capoids exhibit in their tendency to show signs of aging early on in life. That these wrinkles would make a younger man appear to be an elder might provide some customary protection from would-be killers, particularly in a culure that demands respect for the elderly.

The Drokpa people (or, in Kashmir, the Brokpa) are among the best and purest examples of an original Aryan people living a traditional, nomadic steppe-style life. They are some of the last true nomads on Earth. A small, almost pygmy people, they live as yak herders, inhabiting, as indigenous peoples to Tibet, some of the highest areas of the Himalayas. A Dardic people, they have relatively light skin, speak an Indo-European language, and at times have blue or green eyes. They are known to be endogamous and polyandrous "wife-swappers." Of major interest to "UFOologists" are the *Dropa Stones*, large stone discs, very similar to jade or nephrite *bi* discs, as was used in Sino-Tibetan culture to represent heaven, the ownership of which presented an upstanding moral individual the status of high rank. They are followers of Tibetan Buddhism synthesized with the *Bon* tradition, a shamanistic folk religion of Tibet and surrounding areas. Perhaps these Turkicized Drokpa people represent a mixture of Cain the Capoid and Seth the Aryan, an appearance of Cainan.

Also in Tibet, especially Eastern Tibet, are the Tibetan people-proper, simply called *Tibetans* despite their being no more indigenous to Tibet than are the Drokpa. Like all Tibeto-Burmans, the Tibetans are likely to have descended, at least in part, from the Qiang people, a pastoral sheep herding people, founders of the Tibetan Empire. Remnants of the original Qiang people, the Qiang, are henotheistic pantheists who believe in a God of Heaven and other subsidiary gods of natural forces. The Tibetan myth of the birth of their people holds that a monkey, Pha Trelgen Changchup Sempa, came when the whole Earth had been flooded with water, settling on Mount Gongori. In a time of trouble, this monkey visited Mount Sumeru.[1103] Christopher Beckwith proposes that the Qiang were Indo-European, suggesting *Qiang* meant "charioteer" or something like that. The Qiang appeared first in the historical record on oracle bone inscriptions. They oposed the Shang, who made them into slaves and human sacrifices. It is interesting to note that the Tungusic Manchu people were known, similarly to Dravidians by the other Chinese, as *Qing*, perhaps showing some relationship to the Qiang from which the Tibetan people-proper are drawn. China's name may derive from *Qing*. The Ming Dynasty, before the Qing, had held Tibet in suzerainty.

Other groups have also occupied Tibet, including Mongols of Oirat or Kham origin. The *Saka*, a group of Indo-Scythians who would become the Saxons, had spent some time in or around Tibet long enough to have developed an interest in or devotion to Tibetan Buddhism. They contributed their name to the capitol city of the Kingdom of Taka, called *Sakala*, which involved a mixture of Buddhism and sun worship. They contributed toward the school of Sakya Buddhism and perhaps to Christianity as a convergence of Buddhism and sun worship. Some of the Saka Scythians, or Saxons, who would become the *Sakha* after they moved up into Yakutsk, became also known as *Yakuts* (Jats), and dwell in the coldest city in the world.

The convergence in Tibet would have lasting effects on the world system. It is likely from Tibet that the world economy really started developing, perhaps surrounding Denisovan culture, possibly spread first by Australoids around the base of Tibet into maritime Southeast Asia, from which they would have an impact on the Oceanic cultures to come, such as the Melanesians, Micronesians, Polynesians, and etc. Peoples such as the Drokpa, later on, are likely to have come across Denisovans in Tibet itself and to have mixed, becoming important religious leaders of Tibetan Buddhism.

[1103] A connection to Sumeria?

Crazy Wisdom

Where did the concept of *God* first come from? Psychology researcher Julian Jaynes argues, in *The Origin of Consciousness in the Breakdown of the Bicameral Mind*, that the evolution of consciousness is connected with the fusion of both halves of the brain, the left and right hemispheres. Before this, suggests Jaynes, humans had a "bicameral mind," in which our language center, which was also the command center, was disconnected from the locomotive activity of the body, because the former portion was seated in one side and the latter in another side of the brain. Because of this, suggests Jaynes further, humans heard voices when messages were relayed from one half of the brain to the other, during a decision. These messages, suggests Jaynes, were understood to be deities, much as the schizophrenic or manic individual might have religious experiences today.[1104] The command center, which was also the language center, in the brain, was identified with God giving orders.[1105]

Gods have also been associated with the voices of past ancestors. After the passing of one's ancestor, it is suggested, the voice of the past ancestor stuck around. Perhaps the ancestor was needed for guidance, or, as I will propose here, my personal view, the ancestor was a dominant leadership figure, which one might today associate with narcissistic abuse. Narcissistic family abuse is a known factor in developing schizophrenia and other mental illnesses. *Schizophrogenic parents*— those who cause schizophrenia in their children—, for instance, were described by Theodore Lidz and others. This typically included an oscillation between a domineering and a passive parent and by what later authors would term *pseudomutuality*, itself related to the concept of *double-binding*, but which Lidz referred to as "*skewed*" relationships. These kinds of conditions allowed delusions to become acceptable bases of action, because they would go unchecked by the other parent and thus allowed to become a part of the family decision-making paradigm, a condition Lidz called "*dual madness*." I believe this to be fundamentally connected to the abuse cycle that kicked off governments and states, and that we continue in today, which still contributes to psychological disorders. This abuse cycle was started off itself by climate change, such as that surrounding the Younger Dryas.[1106] This climate change, which is also associated with the adoption of sedentary horticulture over nomadic hunter-gatherer lifestyles, caused frustrations that, as described by the social psychological work of John Dollard, Neal Miller, Leonard Doob, Orval Mowrer, Robert Sears, Nicholas Pastore, and others[1107] who contributed toward the "frustration-aggression theory," would develop into anger and even aggression. If not released, some social psychologists suggest, a "residue" anger forms. Thus would begin the abuse cycle, from victims of climate to victims they make of their own families. Abusive leaders would give psychological complexes to their victims, who would go from concern about the physical presence of, or what what would be said

[1104] The first case of documented schizophrenia may have been that of James Tilly Matthews, who had come to believe that spies were using an "air loom" or some sort of pneumatic technology to magnetically manipulate his own mind and those, especially, of targeted statesmen, whose minds could also be read by the rays of the machine. The purpose of this, he said, was espionage. He was placed into an asylum, where he was eventually acknowledged to be of sound mind, but from which he was denied release. Another curious case of schizophrenia, though much later, was that of Francis E. Dec, a Polish American during World War II. He wrote extensively, though often incoherently, about a "Worldwide Communist Gangster Computer God" that eerily sounds like today's AI in some respects, believing Jews to have been the Computer God's pawns. These are examples of the experience of the *targeted individual*, an experience of schizophrenics where they believe themselves to be targeted by something outside of them. This leaves zetetics with many questions.

[1105] Animism considered that there were also gods inside of inanimate objects and animals, just as people had voices commanding them about

[1106] See Gambone[1]

[1107] Perhaps H.A. Dengerinck, J.D. Myers, and J.B. Rotter may count to some degree or another toward the development of this theory, as is implied by context in Worchel and Cooper's *Understanding Social Psychology*

by, the narcissistic dominator, to merely having the impression reinforced in their neuropathways that they must do what they are told or face more abuse.

Conflicts often leave one continuing or replaying arguments in one's own head, a kind of residue.[1108] This residue may be awakened by physical objects, such as geographic markers, that remind one of the conflicts. In this way, objects called *fetishes* may become imbued with the spirits of narcissists. This is how rocks and trees and idols and things become enchanted. Chief Seattle, in his beautiful and pantheistic speech to the Americans who had conquered his people, had said that

> This shining water that moves in the streams and rivers is not just water but the blood of our ancestors. If we sell you land, you must remember that it is sacred, and you must teach your children that it is sacred and that each ghostly reflection in the clear water of the lakes tells of events and memories in the life of my people. The water's murmur is the voice of my father's father.

People would tell stories surrounding landmarks, stories involving the society, often times of conflict or power transitions. In this way, landmarks would become "infused" with the "spirit" or memory of ancestors. This kind of enchantment might also occur with totems or talismans associated with the narcissist. Over time, totems stack up to produce such things as totem poles and coats of arms, which tell the history of the male lineage of the narcissist.

Victims of narcissistic abuse are said to experience *narcissistic abuse syndrome*, wherein abuse leads one to experience an *external locus of control*—being highly influenced by others—, allowing the narcissist to go about their abuse. The abused continues in loving and appreciating the narcissist for what they are apparently bringing to the table, as reinforced by the gaslighting of the narcissist. One typically loves and charishes, or greatly admires and respects, or is otherwise grateful for, the narcissist, who might do such things as engage in *financial* or resource *abuse* with the victim, who becomes economically-dependent on the narcissist. But economic dependence runs second to and reinforces psychological dependence. Narcissitic abuse syndrome makes one dependent upon the narcissist and even to begin to get an inflated view of the narcissist, not entirely unlike a sexual or religious fetish, but instead as fetishization of the narcissist. As with a sexual fetish, wherein one might need something irrational to satisfy their urges—resulting from trauma or abuse—, including ritual abuse as in BDSM, one begins to need the psychological abuse of the narcissist in order to feel satiated.

Fetishization, both the religious and the sexual sort, is often if not always sourced in some kind of trauma or abuse. For instance, the *Cargo Cults* of Papua New Guinea are known for building religious *fetishes*—objects of veneration or religious significance like an idol, understood to be imbued with supernatural powers— in the form of cargo-carrying airplanes. They believe that the airplanes and cargo are sent by their ancestors, who intended the planes to land and deliver to them, but who instead deliver to civilization. By building fake airplanes out of bamboo, and by creating a landing strip, it is believed that the plane may eventually see that they are going to the wrong place. The airplane and landing strip fetishes, and accompanying rituals, are intended to send a message to the ancestors. I believe this to result from the traumas involved in living in proximity to, and being displaced by, civilization.

Some psychologists hold that nightmares exist as a sort of innate therapy for the individual in facing their fears and traumas, whether individual or collective. Some developmental psychologists hold that

[1108] Conflict is a form of frustration. Frustration, according to many advocates of the frustration-aggression theory, does indeed leave a residue, particularly when it cannot be released by some activity, most prominently aggression, especially owing to differences in social power dynamics

myths serve the same purpose for society. It seems that fetishization might be something similar, perhaps relying also on an absence of hope for resolution. If one faces a trauma that is somehow inescapable, as by being unforgettable or by being ongoing, one might begin to find solace in forming a fetish for the trauma, allowing one to find pleasure in it somehow. This may not be unlike the development of other mental illnesses, including multiple personality disorders, in which an individual who has been traumatized enough begins to *dissociate*, to partition their psyche such that another life can be lived separately from the one facing the trauma, giving way to split personalities. These are natural coping mechanisms. This does not mean that they are healthy or can necessarily be reversed once the damage is done, but that they, in some way, help a broken individual to keep going, even if in a fractured form.

Narcissistic abuse, by creating a fetish, may have contributed to the development of ancestor worship, the wiring and instincts behind it likely a remnant from alpha-beta relationships as simpler Hominids[1109] transferred to other areas of life, as with the Cargo Cults and fetish worship or religious fetishism in general. A similar occurrence is seen with phenomena such as celebrity- and billionaire-worship, wherein people— who do not understand that these individuals are propped up behind the scenes, and who mistake their grandeur and social status as a product of the individuals' own efforts— believe these individuals to be grades above the common human being, in the manner of a god or demigod. Such fetishization is the result of the lack of recognition that they themselves have experienced from their peers, recognition that has been diplaced onto celebrities and billionaires, a habit their fetish allows them to join in on. This worship of celebrities and billionaires is the worship of narcissists, those who have taken recognition for their own grandeur, propped up by other narcissists, and perhaps by psychopaths, whose faces and names are less familiar.

In connecting both spheres of the brain, one established an *ego*, a *consciousness* or *conscience*, and learned to identify one's thoughts *as* thoughts and to become more rationally self-directing. Practices rooted in shamanic animism may use music, which may be gendered (much as the mind is associated with gendered use of the hemispheres), and allegories, to weave together the hemispheres of the brain. For instance, in the *Bwiti* shamanism of the Punu and Mitsogo peoples— whose practice of using *iboga* was perhaps passed down from Pygmy shamans, with Bwiti having since been combined with ancestor worship— there is a large emphasis on the healing power of music, especially as it relates to gender. A ceremony led by a shaman in the role of the N'ganga would include gendered use of color, red and white, for masculine and feminine, and the playing of gendered instruments, the *ngombi* harp, a feminine instrument, and the *mongongo*, a masculine instrument. Such ceremonies exist for purposes of initiation and healing. Bwitists believe that they can travel between the red and white worlds of gender and bring back truth from ancestors.

The goal of "crazy wisdom," such as that of the *Nyonpa*, on the other hand, is to break down the ego, the unified mind, in the individual, to induce selflessness and a bicameral mind in them, wherein they see no distinction between themself and other, but also to make one understand that the gods are in one's own mind, to induce deity in oneself as a direct experience. The *Nyonpa* were antinomian Tibetan Buddhist yogis— of the *Kagyu*, "Whispered" or "Oral Lineage," tradition—called also the *mad ones* (counted among the *mad yogis*), who adhered to the *Practice of Observance*, referring to the

[1109] Earlier Hominids were not only hierarchical but polygynous, with alpha males and their supporters being allocated sexual privileges that were not allowed to beta males. Beta males were left to the sidelines, as it were. This trauma might produce a cuckolding fetish in the males, the enjoyment of watching a female satisfied by a superior. This monopolization of females might, as such, be considered a form of narcissitic abuse that was, at one time, standardized. The reduction of sexual dimorphism, by way of the culling of alpha males, might have made the genetic precondition for fetishization— in general, not just sexual—, as a result, more widespread.

observance of one's breath or thoughts, or otherwise known as *mindfulness*. Part of the Observance, for the Nyonpa, was crazy wisdom. *Crazy wisdom* is wisdom derived in an irrational and often uncomfortable or antinomian way. It often involves riddles, allegories, poetry, jokes, jest, symbols, or other manners of confusion-causing or indirect teaching, including the playing of tricks. Chogyam Trungpa describes crazy wisdom as induced hopelessness, accessed by recognition of emptiness and unanswerableness in the search for truth. Trungpa, true to tradition, is notoriously inconsistent in such matters, however. It appears to me either way that devotees of Observance are hopelessly depressed, and that their techniques, designed to result in egolessness, are efforts to drive participants to psychological "rock bottom" wherein ego death may be experienced. Through crazy wisdom—basically gaslighting, whether oneself or others—, the mad yogis intend to make a person so hopeless in finding a rational answer that they are induced to have an ego death, or psychological death, wherein one experiences an irrational selflessness, deriving one's purpose from what can be done for others. Remember that one's ego is what was contructed from the development of the rational or conscious mind away from the bicameral brain. And it results from natural selection.

Crazy wisdom might be used to induce the audience into a state of logical failure and giving up of literal interpretation, or even cause conflict to break out, with the goal being to direct them to the inherent "emptiness" that Tibetan Buddhists associate with truth concepts, and which might be compared to the Sophist claims that the truth does not ultimately exist or cannot be conveyed in language. Much like the Sophists, the crazy yogis would also play language games, or use rhetorical tricks.[1110] One reason that this attempt may be made might be pointed to in the concept of *loci of control*—or "center of decision-making"— in the field of social psychology, which suggests, following the work of J.B. Rotter, that individuals may either have an *internal* or an *external locus of control*, a center of decision-making within themself or outside of themself. H.A. Dengerink, M.R. O'Leary, K.H. Kasner, and J.D. Myers, especially in the paper by Dengerink and Myers, "The effects of failure and depression on subsequent aggression," would contribute to research showing that the internal locus of control could be reduced in establishing events of failure.[1111] What this amounts to is that, if one is made to undergo failure, it breaks an individual down mentally, such that they are more likely to give in to threats from others. The origin of this may have resulted from hopelessness induced by the climate, and techniques to drive one to rock bottom, and to experience divine madness, may have been methods of battling climate-induced depression, skipping the depression part and jumping to the manic euphoria or schizophrenic mystery.

An example of the sort of abuse that may be inflicted by the practice of the *Trickster*, a particular religious archetypcal figure who may take the form of a crazy shaman, a mad yogi, a "Coyote" teacher, or other such figures. Many such figures would be deified into forms such as Hermes, Prometheus, Lucifer, Loki, Lugh, and so on, and in medieval society would take the form of Fools or Court Jesters, a position often filled by a Sufi (Islamic neo-Sophist). The Trickster figure, also prominent among the shamans of the Capoid Khoisan, would take the form of the Nyonpa in Tibetan Buddhism. A good example of crazy wisdom may be a tale of Nasreddin Hodja, a satirist[1112] Sufi who is said to have been invited to give a sermon, the story of which goes something like this:

Upon arriving to deliver the sermon, Nasareddin said, at the pulpit, "Do you know what I am going to tell you?" to which the audience replied, "No." He told them that he didn't wish to speak to people who did not know why he was there, and left abruptly.

[1110] This would be passed down ultimately through the Counter-Enlightenment and is with us still today
[1111] See Dengerink and Myers
[1112] This word has relation to the Greek *Satyr*, a creature related to the Greek *Pan*, whose name contributes to *pan-theism*

Ashamed of their foolishness, he was invited back. Upon his return, he asked once again if it was known what he was going to say. The audience, desiring not to upset him once more, declared emphatically "Yes!" Nasreddin then declared, "Since you know what I will say, there is no reason for me to deliver the message." He left once more.

Invited back again, he asked his question still another time. The audience then gave a mixed answer, with some saying "Yes" and others "No," to which he said, "Let those who know tell it to those who do not." He did not return.

Some of the crazy yogis or crazy sages, being antinomian to the core, and like true narcissists, were sexual predators. Drukpa Kunley, the *Saint of 5,000 Women*, a crazy yogi of Drokpa heritage, directed most of his methods toward women and sex with them. One of his poems goes like this:

I am glad to be a free yogi
I develop more my inner happiness
I enjoy sex with many women,
Because I help them to the way of enlightenment
Outside, I am a madman
Inside, I am dedicated to religion
Outside, I enjoy alcohol, women, and music
Inside, I labor to benefit all
Outside, I live to satisfy my pleasure
Inside, I do everything at the right time
Outside, I am a beggar
Inside, I am a Buddha

Drukpa Kunley was said to have rejected blessings for anyone who did not bring him a beautiful woman to have sex with and a bottle of wine to go with it. Tsangnyon Heruka wore human fingers and toes in hair, ashes and blood on skin, bringing to mind the devotees of Kali or her male companion Shiva,[1113] such as the Thuggees, the Aghoris, or, as Aristotle said, Jews, as he said that they were followers of the Indian "Kalani" philosophy, which means a follower of the goddess Kali. Heruka was perhaps the first called a *Nyonpa*. Guru Rinpoche was a *Nyonpa* as well, as was the Second Dalai Lama. Mad saints in India are called *avadhuta*.

Egolessness allows the narcissist to have better influence on the individual, as can be understood in the Sufi story of Rashid ad-Din, leader of the Assassins, who ordered his underling to jump to his death, which he willfully did for the sake of obeying his master, who wanted it done so to impress an enemy commander with the obedience of his men. Could it be that such a powerful narcissist would leave an impression in the minds of his men after his death, such that they concerned themselves with him, even hearing his voice or fearing his watch, after becoming deceased?

As mentioned in the Sophist example, and as implied by the relation of Sufism to Sophism, shamanism and Tibetan Buddhism were not alone in their divine madness. This madness was also compelled in ritualistic practices in Vedic, Abrahamic and proto-Hellenistic societies, as well as in Messianic figures. Mircea Eliade holds that divine madness is a common part of shamanism, and that it is distinguished from mental illness by the shaman's being in control of it rather than the other way around, being able to access trance states and to come out of them willingly. This divine madness was described by Plato,

[1113] Shiva is, like the Hebrew God, a synthesis of many gods including a storm god

who, despite recognizing that madness was commonly seen as an evil, described the right kind of madness, dependent upon what was considered "normal," as "a blessing from the gods" in his *Phaedrus*. This kind of "blessing" was also sought after by the *Fools for Christ*, such as Simeon the Holy Fool and Francis of Assissi, who would do such things as drag around a dog corpse, alternate between feigning crippling ailments and jumping around with glee, or give up their possessions, walk around naked, beg (or steal), give up their homes, and practice other aspects of the *mendicant* lifestyle. Among the ascetic Fools for Christ—often practitioners of Catholic or Lutheran Strict Observance—, one might use *rosaries*—similar to Buddhist prayer beads— or self-flagellation, self-mutilation in public by wipping oneself.

More contemporary cult leaders, such as Adi Da, previously known as *Bubba Free John* or *Da Free John*, have successfully established cults wherein the leader is worshipped, and had sex with, by many of its members. Narcissists such as Adi Da play on people's depression and hopelessness, encouraging them toward psychological rock bottom and ego death, and to worship him as the only solution to their problems, the only way to experience joy. Such crazy wisdom as is extolled by Adi Da and others, coming out of places like Tibet but once being prevalent much more widely, is a means of social control and psychological domination. When one experiences ego death, at "rock bottom," one becomes selfless, and accepts that there is no way to experience personal satisfaction. Instead, one becomes driven to live for the satisfaction of others. There is never a guarantee that others will do what is needed to satisfy us, as we have no control over others (unless, perhaps, you are Adi Da), but we do have some control in whether or not we may help others.[1114] Mad yogis such as Adi Da play on this, driving the individual to ego death and providing them an outlet for their resulting altruism, someone who they can satisfy outside of themselves, and to thereby derive purpose from.[1115]

Not entirely unlike a crazy yogi was the notorious punk rock musician and narcissist, G.G. Allin, born Jesus Christ Allin, who was made famous by his crazy misanthropic antics. These would include defecating on stage, physically abusing audience members, nudity, and acts of self-mutilation, some of which sent him to prison a number of times. Allin drew a true cult following, despite popular opinion surrounding him. Followers defended G.G. on the grounds that his shows were voluntary and that audience members knew the risk of going. G.G. would regularly speak as if abuse, rape, and murder were not beyond him, and promised that he would die by suicide at one of his performances, but died instead by overdosing. After promising to kill himself on Halloween, but being imprisoned instead during that time, G.G. continued to make his promise, only to keep being put in prison before Halloween. When asked why he did not defecate on stage, as was his custom, he replied— as reported in Mykel Board's "You're Wrong: An Irregular Column"— that, "[w]ith G.G., you don't get what you expect—you get what you deserve." Board says,

> His fans said he was God. They were close. Pure id, GG refused to bend to any rules. He lived through pain, coma, hospital and jail. He was afraid of none of them. Free of fear, he was absolutely free to do what he wanted. What he wanted to do, was destroy.
>
> You'll read obituaries calling him sick, a sad comment on society, maybe even pathetic. He was not. Though he lived for less than 40 years, he lived without duty, without thought to the future, worrying about bills, acting politely for the neighbors.

[1114] Of course, some "help" may not be wanted, and may be offensive or a hindrance, which may offend the person who has come out of their ego-death but who nonetheless tries to maintain the practices adopted while in it

[1115] This is not true altruism, of course, because it is still an attempt to satisfy the worshipper

> He did what he wanted, when he wanted. How many others have lived so fearlessly for so long? [1116]

G.G. Allin's antics may be related to the mental health of his father, an abusive religious fanatic who named G.G. *Jesus Christ* after having been told that Christ had visited him and told him his son would be like a messiah. Allin said that he was grateful to have been raised in such an abusive environment because it made him into the strong person that he believed himself to be. Allin was obsessed with serial killers and visited John Wayne Gacy, the "Killer Clown," who painted G.G.'s portrait.

Narcissists, in their abusing of others, establish narcissism in others, such that it is often passed down as a family habit. They might demand that others give in to their "tough love," which is anything but and refuses to reward "weakness," and, like the Trickster, seeks to teach it a lesson by making it feel the sorrows of its shortsightedness. The Trickster plays the role of a medium for Nature to teach us hard lessons in life, like not to give one's authority over to another. A crazy yogi might, for instance, purposefully tell someone who is asking for their authoritive opinion a lie, justified by being said to teach them the blunder of giving one's authority to another person. The "tough love" of the Trickster must be distinguished from the tough love of the Protestant or primitive Christian, or the secularist, however, as the Trickster is an active force of deception, causing the loss, whereas the tough love exhibited by Protestants and the others tends to be more about enduring the consequences— not of man, but— of Nature. The narcissist tries to claim the role of the Universe in administering so-called "tough love."[1117]

What we seem to be looking at with mad yogi cults is a regression to a bicameral mind imposed by narcissistic control by priestly chiefs and monks coming into the horticultural era, which would continue into the development of civilization, which is replete with mental illnesses.[1118] This bicameral mind contains within it the experience of being spoken to and commanded by other voices, later integrated into a more balanced, better-connected brain. In such a brain, point out the New Atheists, the desires of God highlight the same areas as one's own desires, such that one is assumed to identify God's wants with one's own on that level. But in the bicameral mind, one's ego does not fully exist, and the position of God can be identified with authority figures, such as Big Men and chiefs, who would also have played the role of narcissistic family abuser in the shift from egalitarianism to chiefly or priestly control. The trauma from this abuse would continue after the death of the authority figure, who would continue to be identified with the voice of God even in their physical absence. This would drive people to revere their narcissistic cult leaders—essentially living in an expanded narcissistic family cult— and to engage in ancestor worship. Eventually the ancestor gods would be banished to the mountain tops and to the sky, where they are said to occupy the highest peaks and the planets and stars, if not to embody them. These would include high places such as Mount Olympus, the Taurus Mountains, the Zagros, Hindu Kush, and the Himalayas.[1119] Because climate change was known to have been a factor in the spread of narcissistic control by chiefs and cults, solar savior-deity myths and fertility rites appeared, with the purpose of bringing back the warmth and abundance of better days.

[1116] Board

[1117] Tough love can be legitimate sometimes

[1118] Jaynes's theory comes up against a problem with explaining how contemporary hunter-gatherers are not schizophrenics, because Jaynes suggests that the unicameral mind became established just over 2,000 years ago or so, in the context of agricultural kingdoms. This suggests to me that, if Jaynes is correct in the first place, the phenomena being described was a regression to a prior state that hunter-gatherers had already surpassed, perhaps as Cro-Magnoids.

[1119] It is interesting to note that the Denisovans were well-adapted to the high altitudes of Tibet, and that Sherpa people and others in the area even today have a considerable amount of Denisovan genetic heritage. Also high in Denisovan DNA are Papuan highlanders.

The onset of the Neolithic is understood to have come with a reduction in brain capacity. In fact, one study by Constantin Cretan asks, "Was Cro-Magnon the Most Intelligent Human?" saying that "the transition from the Palaeolithic to the Neolithic might have led to a decline of intelligence," and that "human intelligence had reached its peak with the Cro-Magnons."[1120] A number of explanations for this are possible. The Levantoid component of the "Basal Eurasian" of the Neolithic may have greatly reduced intelligence, for instance. Another possibility might be that the onset of the Younger Dryas had been very difficult for people, causing a reduction in brain size due to stress and depression. Going from hunter-gatherer to horticultural subsistence, the cause for doing so was out of necessity, because climate change during the Younger Dryas had made hunting and gathering very difficult. Horticulture allowed us to shift from immediate-return societies to delayed-return societies, with our cultivation as our investment into the future. Horticulture probably arose from supplemental planting by nomadic peoples who learned that they could spread the seeds of their favorite foods along their trails, despite not being around to garden them. This caused a niche construction, whereby we had to forever do without hunting and gathering as a main subsistence and would have to solve the problems caused by horticulture with new techniques such as agriculture, which had itself to be solved by industrial agriculture, which will have to be solved by something else.

In the shift from egalitarian hunter-gatherer, in which our equilibrium-state psyche developed as a matter of evolutionary psychology, to authoritarian horticultural society with chiefdoms and priest-kings, we experienced a serious increase in narcissistic and psychopathic behavior coming from the top. Coercive and deceitful authority is essentially narcissistic,[1121] psycho- or sociopathic, or something relatable.

Climate change had led to stressors that caused frustration within families, which led to displaced aggression by the re-emergent alpha males—the chiefs and priests—, leading to subject-object conflicts in the psyches of offspring, and so mental illnesses. When one is aggressed against, without understanding why, there is a mismatch between subjective expectations (deserving fairness) and the objective facts of the world (being punished for no reason). When conflicts between the subjective experience and objective reality are extended throughout a length of time, without understanding of the causes and without release of frustration, mental illness may result. Mental illness arises from a mismatch of the organism with their environment. Psychopaths, on the contrary, don't feel stress the way that normal people do. In a pioneering situation, such as seafairing on small watercraft, mountaineering at high elevations, living in the dessert, conning, dominating others, and etc. psychopathy may have a competitive advantage.

Change of climate might account for religions focusing on practices such as meditation, as well, which have been shown to allow one to regulate one's body temperature to a certain degree, with aspects being used also in practices such as ice swimming. Indeed, clinical depression is understood to be an adaptive feature that may have allowed humans to get through very harsh periods by limiting the use of energy (depressed people are generally inactive), perhaps including the onset of ice ages, possibly even allowing people to hibernate. But depression and stress of various kinds do serve to reduce the size of the brain, as well. Buddhism suggests that we resolve this problem by rejecting the realness of our desire, which the Buddha said was the source of our troubles.[1122] If we simply stop desiring things, we

[1120] Cretan

[1121] One must be aware that there are some varieties of narcissism that are expressed outwardly as altruism

[1122] Easy enough, right? Realistic too! Or is it? Sounds more like gaslighting to me. Spinoza and the pantheists, however, suggest learning as much as is possible about the natural world, establishing a therapeutic fullness from which we can access rational and self-evident truths. This is a major difference between Eastern and Western varieties of enlightenment.

cease to be disappointed. Other kinds of mental illness besides depression are also likely to result from strong stressors. Some of these, such as mania, include euphoric feelings that may even be desirable to the person experiencing it, perhaps contributing to practices intended to bring such feelings about, maybe even involved in "divine mania," as is practiced by mad yogis.

Authority figures caught up in the chain of narcissistic abuse, but free from its immediate presence, and assisted by the therapeutic affects of music, might begin to conceive of self-inherent truths, and to rationalize to themselves that their deceased ancestors don't actually have any control over them. In doing so, they would develop their own locus of control. But doing so would depend on displacing the godly status of the ancestors to the very first ancestor, which is responsible for everything. Ultimately, this is the first cause within it, or the Universe as a whole, to which that is owed. In some respects, the Universe, in going about geological and climatic change, and causing trauma in living things, plays the same psychological function as a domineering narcissist. Storms, droughts, and dearth are unrelenting and cruel, and for people who tend to subjectively personify forces of Nature and not to objectively rationalize them, like animists, they appear to be just as intentional. But in submitting oneself to the inescapable forces of Nature, to embrace *amor fati*, the "love of one's fate," is psychologically healthy and rewarding, as is suggested by the psychology of Baruch Spinoza, in his *Ethics* (and in anticipation of Nietzsche who is associated with the term). Human authority figures, while, yes, elements of Nature, are not in the same way the inescapable totality of Nature herself. While the existence of authority does demand acceptance, as by Spinoza's prescription, the arbitrariness of it, the lack of a meeting of the minds, causes, as is suggested in social psychology, frustration, anger, and then aggression, the sort, perhaps, that would have inspired beta males to have killed off would-be alphas.

Pantheism is a means of grounding the inner voice of God in Nature, of focusing one's endurance of narcissistic abuse toward love of Nature, who really is dominant over us, and away from our fellow human, who is essentially our equal, but who will play mediator if we allow it. The pantheist worldview allows one to fill the void of emptiness with a fullness of wisdom and a contemplative love of God. Pantheists such as Spinoza would encourage self-confidence in place of humility, as expected from the cult leaders and priests, and which Spinoza dismissed as a vice.

One thing must be understood, however, and it is very important. As there is no such thing as absolute evil,[1123] we must understand that the mad yogis, and the civilizations that developed from them, are a pioneering effort that followed an ecological disturbance— climate catastrophe, the Younger Dryas— and, as such, plays a necessary role in re-establishing what balance may have existed beforehand, much as the thorns and spines of the pioneer plants must accompany the preparation of the ground for their successor. The narcissism of cult leaders, and the obedience of those who were narcissistically-abused, are likely to have been necessary preconditions to the shift toward the consistent performance of hard labor that was needed in horticultural societies.

Philosophy and Religion

While offense and defense are what traditionally separate East from West militarily-speaking, philosophy is what largely sets the West apart from Eastern thinking. While philosophy comes from the West, becoming particularly established among the Greeks, religion comes to the West largely from the East through Canaanite (Phoenician, Judaic, Anglo-Saxon) and Egyptian sources, especially emanating

[1123] That which is "absolute evil" is that which is motivated by "pure destruction," but since the final cause of such destruction is nothing, and nothing does not exist, the final cause for absolute evil does not exist, and so absolute evil does not exist. Evil is the absence of good as cold is the absence of heat. True cold and true evil do not exist, but are only relative absence, not absolute absence, of heat or good.

from Tibet and the Himalayas and the ancient influence of these areas in South and East Asia, perhaps especially India, and up through Babylon and the Red Sea. The influence of the Himalayas and Tibet was afforded by being at the source of the major Asian river systems, thereby being able to "prophesy" destructive droughts and floods controlled by dams, should a people decide not to pay the proper tribute to the "King of the Mountain," who ruled as a god at the water's source. There is reason to believe this God-King of the Mountain had Denisovid genetics, possibly a relict in refuge from the advance of superior races, perhaps a relation also to the Titans or Olympians, also having some Capoid genetics.[1124] Superstitious fear of ancestor gods connected with forces of Nature would give the relict gods extra support. The East, when it does do philosophy, is generally solipsistic and can go outside the bounds of natural philosophy. That's when it does philosophy at all, however, as the East is more readily associable with sophistry and religion than with philosophy.

True philosophy in Asia comes from the West. Indian philosophy is generally attributed to Vedic sages, though there does appear to be some claim to pre-Vedic thought by people of color from the time of the Indus Valley Civilization. However, while advanced farming may have begun in the Indus and spread Westward, it had likely been initiated by the Kebaran-derived Natufians and Zarzians, sources from the West, perhaps suggestive of some influence by albinizing peoples. Thiruvalluvar, considered a Tamil philosopher but probably more of a sophist, is variously depicted as jet black, indicative of aboriginal influence, and as light-skinned, suggesting some Aryanization. Jain founders are also depicted as people of color at times, though rarely jet black. Jain origins are connected to the Solar Dynasty and to Kshatriya caste of warrior-rulers. *Jain* means "conqueror." People of the Solar Dynasty are generally depicted as white, including Rishabhdeva, Jainism's first recognized preacher. Buddha, an Indo-Scythian (Saka, Goth), came from this dynasty. Ancient Chinese philosophers, such as Lao Tzu and Confucius, can be traced to Aryan and Scythian sources, as well as Mediterranean ones. Sun Yat-Sen, a modern Westernized Chinese philosopher— whose role in overthrowing the synarchist Qing Dynasty was instrumental—, brought the rational-legal authority of republicanism to Chinese society well after the modern era had already set into the West, using the *tong* secret society as his vehicle of revolution.

Greek pantheism and naturalism, at large, has its home in the *sages*, or "wise men," of times preceding those we refer to as *philosophers*. Pre-Socratic philosophy in Greece tended to bleed from out of sophism, with Thales, perhaps the first Greek philosopher, himself known as one of the *sophoi* before his being categorized retrospectively as a *philosopher*. The earliest philosophers, such as Thales and Empedocles, were, in fact, sages, or wise men. Empedocles talked about the sage in his *Sphairos*, wherein he lays out his doctrine of pantheism, wherein the entire cosmos, taken as a whole, is a superorganism containing all of the lesser organisms produced during the *zoogeny*, or genesis of living things. Horace relays, by way of Pierre Hadot in *The Inner Citadel*, that this *Sphairos* was "[c]ompletely within itself, well-rounded and spherical, so that nothing extraneous can adhere to it, because of its smooth and polished surface."[1125] Pierre Hadot develops on Karl Ludwig Michelet's view that "Greek religion culminated with its true god, the sage," saying that when "philosophers achieve a rational conception of God based on the model of the sage, Greece surpasses its mythical representation of its gods."[1126] According to the editors of the *Wikipedia* article "Sage (philosophy)," commenting on this, "the actions of the sage are propounded to be how a god would act in the same situation."[1127]

[1124] Though these identities should not be used to try to contain the shape-shifting sort, which mixes with all and takes on various identities
[1125] Hadot, 119
[1126] Hadot, 58
[1127] Wikipedia[2]

Indeed, it appears that the Greek philosophers had developed from the earlier sages, themselves distinguished from the even earlier shamans and priests by their emphasis on rational inquiry and naturalism. In large part, the philosophers were reacting against the sophists who had, themselves, tried to commercialize the teachings of the sages. The sophists had concluded that the sages contradicted one another and that the real power of their efforts was in their rhetoric, which was compelling at certain times. Sophists found interest in the political use of the sages' sayings and influence, but did not adhere to their emphasis on truth and goodness, which would be picked up by the philosophers, who were, in a sense, the heirs to these earlier wisdom teachings, carrying on past the influence of the sophists in elaborating brilliant cosmologies and moral systems. The *sophists* ("wise instructors," devotees to Sophia, goddess of Wisdom), such as Protagoras, were admirers of the *physikoi* (physicists) and *physiologoi* (physiologists), but were not immune to *mythologoi* (mythologists) and *theologoi* (theologians). The sophists held to a highly relativistic worldview, were skilled in rhetoric, and could argue both sides of an issue. Their lineage had come from a time before, likely from following the teachings of the wise men or sages in what is called the *Wisdom tradition*. While the Abrahamic faiths are exoterically opposed to rationalism and philosophy, having the snake in the Garden of Eden, and his sharing of knowledge, as their devil, there can nonetheless be found an esoteric element of wisdom or philosophy even in *The Bible*, which can be found in its Wisdom texts, *Proverbs*, *Ecclesiastes*, and *Job*. The Wisdom tradition within the Abrahamic faith is generally known as the *royal wisdom* tradition, as it was generally reserved for the royals.[1128] Considered experts in their crafts, and very wise, the sophists[1129] pre-date the philosophers and give rise to them, with philosophy becoming separated from sophism after the Socratic Revolution. *Philosophy*, or *philo-sophia*, is "love of Sophia" or "love of Wisdom," as *Sophia* is the goddess of wisdom. After the Socratic Revolution, wherein the moralistic philosophy of Socrates took hold, and especially by way of Plato and Aristotle, the sophists would come to be seen as great rhetoricians capable of wordplay and manipulation, philosophical teachers of the rich and powerful, and as charlatans, charges also levied at famed and elite philosophers such as Plato and Aristotle.

The proclivity of the West for philosophy may owe itself, in part, to the Neanderthal and Cro-Magnoid culture and substrate in Europe, which tended to a low proclivity for purely abstract or symbolic thinking and a tendency to naturalistic or common sense thinking. This sort of thinking would produce synthetic and eventually analytic language, relayed by phonetic alphabets. The Vietnamese language, in contrast, hadn't been given alphabetical form until put under French rule and by way of a French priest. Chinese language is traditionally written in characters, not letters. Mongoloids tend to have Denisovan admixture typically absent in Europeans, and more Australoid influence, perhaps connected to an enhanced proclivity for superstition or religiosity not found so natively in Europe. Unlike in South Asia, where Aryans and Nordics established caste rule over people of color, and where white rulers had an easier time ruling through gaslighting their colored victims; in Europe, rule was established largely over

[1128] *Proverbs* describes the Universe as morally ordered according to the principle of *Hokhma*, or "Wisdom." This Wisdom is an attribute of God, which one taps into oneself when one acts wisely and practically. It permeates the natural order of the Universe. The use of Wisdom is good, but there is no evil other than foolishness. In fact, *Proverbs* uses the world for "fool," which is literally *evil*. The work contains many Masonic themes, including references to architecture and stonemasonry. *Ecclesiastes* is something of a documentation of experimental approaches, ultimately resolving that, no matter what, mortality is inescapable. *Job* describes a council of beings called the *Sons of God*, among them "the Satan," which is an oppositional role among the Sons of God. The Satan is allowed to inflict many horrors on a very righteous man, named Job, who was undeserving. The Satan had convinced God to allow this, so as to prove that Job's love of God was not dependent upon God's rewarding Job. Eventually, Job demands God explain, and God shows Job immense powers, demonstrating that Job's mortal understanding was not sufficient to judge God from. This treats "the problem of evil."

[1129] Having relation to *Sufis*

white or whitening people, as rulers there had a more difficult time and developed, by way of pressures from the bottom, toward "rational-legal authority," as Max Weber called it, a component of democratic and republican societies, as are found especially in the West.

Natural philosophy— the study of Nature, as characterized Greek and Roman philosophy— can be found as far back as the Phoenician scholar Sanchuniathon and Thales in Ancient Greece, but became particularly systematic in Aristotle's works on metaphysics, physics, and biology. Aristotle understood *Nature* (*physis*) to include those characteristics developed by a thing's own accord, and included not only efficient and material causation, but also formal and final causation. Nicholas Georgescu-Roegen, in his *The Entropy Law and Economic Process*, remarks that

> Other civilizations may have arrived at the notions of *cause* and *effect*, but only that of Ancient Greece struck, and almost from the outset, on the idea of causality as a two-way algorithm: except the First Cause, everything has a cause as well as an effect. However, because of their paramount interest in the First Cause, the Greek thinkers focused their attention on cause rather than on effect. As we know, Aristotle turned around the notion of cause until he discovered four forms of it.
>
> [...]
>
> As partakers of the Western mind we are apt to believe that causality represents, if not an *a priori* form in Kant's sense, at least one of the earliest notions inevitably grasped by the primeval man, yet the brute fact is that in contrast to Greek civilization the ancient cultures of Asia never developed the idea of causality. It was thus impossible for them to link the logical syllogism with the causal algorithm and organize factual knowledge theoretically. However, we cannot blame only the absence of theoretical science for the very well-known fact that over the last two millennia or so factual knowledge in the East progressed little, if at all, despite the substantial advance it had over the West at the outset. Other factors as well counted heavily in the balance.[1130]

Natural philosophy—or philosophy more simply— is generally split between the schools of idealism and realism, sometimes considered in terms of spirituality vs. materialism or psychologism vs. physicalism or solipsism vs. referentialism (common sense). What constitutes natural philosophy is a matter of debate, but while naturalism does contain idealistic interpretations within its scope, it is the physicalist, materialist, and mechanistic approach that is most readily or obviously associated with philosophical naturalism. This tendency in thought comes largely from the early Ionian philosophers, or *physikoi* ("physicists") and *physiologoi* ("physiologists"), such as Thales, Anaximander, Anaximenes, Heraclitus, and Anaxagoras, as well as from the atomist traditions of Leucippus, Democritus, and Epicurus, and Apollo, Asclepius, Hippocrates, and more. The *physikoi* and *physiologoi* ran contrary to the *theologoi* ("theologians") and *mythologoi* (followers of mythology) that might be associated with the Orphics, pagan bards like Homer and Hesiod, Pherecydes, Parmenides and the Eleatics, and Pythagoras, and on down through Plato and Plotinus. The *physikoi* and *physiologoi*, as might be expected, tended to physicalism and physicalist explanations for phenomena. They generally rejected eternalism and idealism in favor of presentism and materialism, and preferred determinism to teleology. The *theologoi* and *mythologoi*, on the other hand, were friendlier to eternalism and idealism, and might reject presentism and materialism, preferring teleological and imaginary explanations for psychic noumena. The physicalists tended to prefer phenomenal explanations, while the psychicalists tended to prefer noumenal ones. While the *theologoi* were not entirely excluded from the natural sciences, it would be

[1130] Georgescu-Roegen, 31

the *physiologoi*, the *skepticoi*, and Aristotle's lineage that would be most associated with natural philosophy.[1131]

From an Easterly perspective, natural philosophy as a whole might generally be considered to be *Nastika*, though aspects of natural philosophy are acceptable to *Astika* as well, such as the atomist school, or *Vaisesikas*. Thus, it is especially the realist side that would be considered *Nastika*. The idealist and theologian (*theologoi*) side, and some aspects of the physicians and physicists (*physikoi*), while having some *Nastika* flavors too, were more aligned with the older sophists and mythologists of the *Astika*. Nonetheless, philosophy as a whole— properly speaking, *natural* philosophy and not sophistry— demanded that there at least be rational grounds for claims regarding the supernatural, leading idealists and theologians to defend their arguments, to the best of their ability, with mathematics and logic (these were also in use in the East). Another way to put it is that *Astika* and idealism concern themselves especially with the *sacred*, that having to do with divinity, the Right-Hand Path or *daksinacara*, white magic; while *Nastika* realism or absurdism is oriented in the *mundane*, the natural and common affairs of daily life, green magic, or the *profane*, that which is taboo or forbidden, the Left-Hand Path or *vamacara*, black magic.[1132] *Astika* did not forbid the mundane, and may even seek explanation of it, but opposed orientation in it. The mundane was a largely neutral place of realist natural philosophy and green magic, and its advocates, rationalists sometimes considered to be "Luciferians"— often confused for profane Satanists—, might dabble in aspects of both Right-Hand Path or white magic and Left-Hand Path or black magic.

The mundane and sometimes slightly profane realists tended to focus on harm-reduction, as might be seen in concepts such as Epicurus's *ataraxia*, or "freedom from concern," while the idealists and believers in the sacred, with concepts such as Plotinus's *henosis*, a blissful union with the Divine, focused on transcendence and deification, perhaps the ultimate satisfaction.[1133] Nonetheless, this satisfaction would be achieved through ritualistic magic encouraging an appearance or behavior of selflessness and altruism; whereas harm-reduction typically involved some degree of hedonism. Aristotle's way of *eudaemonia* was something of a balanced compromise, common to the Axial Age he was a part of, such as that of Lao Tzu's Wisdom, the Indo-Scythian thinker Buddha's (or Shakya Muni's) Middle Way, or Hillel and Jesus's Golden Rule. A Middle Path, or dialectical approach, would tend to characterize good philosophy in the Axial Age and ever since, and can be found in thinkers such as Plotinus himself (himself somewhat Aristotlean) to a limited extent, Eriugena, Nicholas of Cusa, Amalric of Bena, Giordano Bruno, Spinoza, and so on. By the time of Spinoza, *neutral monism*, the view that idealism and realism are two aspects of Nature as a whole, growing from the mundane views of natural philosophy and green magic, would be clearly and thoroughly expounded, and the conflict between harm-reduction and deification would be philosophically and alchemically eliminated. Church and State worked together to restrict access of commoners to these ideas. Finally, those who took to the Left-Hand Path of the absurd and profane would form Thugees ("Thugs"), *Aghori*, *Nyonpa*, and other amoral or anti-moral schools of thought, contributing to Western-style "divine madness" and strands of Strict Observance. Somehow the *theologoi* found a way to assimilate divine madness into their sacred beliefs, despites its relationship to the profane, perhaps speaking to a development toward Western

[1131] This lineage would be passed down in modern philosophy primarily by way of empiricists and rationalists such as Hippocrates, Archimedes, Galen, Theophrastus, Roger Bacon, Mondino de Luzzi, William of Occam, Machiavelli, Blaise Pascal, Galileo, Edmond Halley, Copernicus, Johannes Kepler, Isaac Newton, Francis Bacon, Giordano Bruno, Thomas Hobbes, David Hume, Rene Descartes, Baruch Spinoza, and Leibniz

[1132] A Left-Hand Path, or *vamacara*, approach is one that is not only Nastika, but is strongly against custom or law or faith. The Left-Hand Path is a path that embraces the profane.

[1133] These might be related to negentropy and syntropy

monism and idealism and slowly away from dualism as can be found among peoples such as the Zoroastrians, Abrahamic religions, and so on.

The zetetics, or skeptics (*skeptikoi*, "those who doubt"), such as Xenophanes, Pyrrho, and Sextus Empiricus,[1134] seem to have taken a more "middle of the road" approach as well, with Xenophanes having spent time in both Ionia and Elea, being influenced by both the *physiologoi* and the *theologoi*, himself dabbling a bit in both sides and influencing both sides, from Zeno of Elea to Democritus. Aristotle and the peripatetic school, and the later Stoics, likewise maintained a middle of the road path.[1135]

Whereas religion stressed blind submission and faith in obedience to God and the sacred, natural philosophy supported mundane free and rational inquiry, critical evaluation, and discerning judgement. Natural philosophy, as a result, would lead to republican and democratic, and finally anarchic, conceptions of religious and stately or governmental authority. All along the way, Church and State countered these efforts. These would would increasingly look Eastward for support, even while pushing back against Eastern advances. Religious and governmental authority across boundaries involving coopetition, rulers have long seen a common interest in supporting one another against slave and peasant uprisings, even while competing with one another for territory and supreme rulership; this prize, after all, was nothing if not for efforts to preserve it, and those rulers who did not die in battle might simply give up their sovereignty for suzerainty, still maintaining local rule as kings under an emperor or as dukes and counts under a new king. While genuine republican and democratic efforts had been in the interest of rulers early on, as in Rome and Athens, and despotic and oligarchic variants would continue to be so, more and more genuine efforts would be attached to the lower nobility, gentry, and commoners against strata higher than themselves.

Ancient Pantheism and Luciferianism

The traditional religions of the world involved Nature worship of one sort or another. They tended to venerate various aspects of Nature, such as the Sun, Moon, planets such as Mars, Mercury, Venus, constellations and distant stars, as well as volcanoes, seas, storms, trees, animals, and other natural phenomenon. The Earth Mother and Sky Father motif had been especially common during the Chalcolithic and Neolithic, particularly upon their meeting, especially among Indo-Eurafricanoids, Americanoids, Lappoids, and Tungids, being a primarily Borean belief system. This shamanic system typically involves a concept such as the *World Tree*, sometimes considered to be the *Tree of Life* in *The Bible*, and generally understood to represent the *axis mundi*, or the "axis of the world," as described by Mircea Eliade, its central pole, which is also the point at which Heaven, or the sky, and the Earth meet. Perhaps the most powerful example of an *axis mundi* is the Aurora around the North Pole, and the pole's relation with the Pole Star. It is mostly likely that the origins of the World Tree belief come from the arctic and spread both throughout Eurasia by Lappoids and Tungids and throughout the Americas by Americanoids from there. Otherwise, a volcanic mountain and its accumulation of electricity around its summit is most likely the most powerful example of a perceivable *axis mundi*. The Guanches, for instance, worshipped the Teide Volcano as a sort of *axis mundi*. Things that reminded people of volcanoes, such as mountains and pyramids, would also be worshipped or revered. Others among the New Age movement have claimed that there are spiritual or electromagnetic vortices, or "stargates," in

[1134] Who gives his name to *empiricism*

[1135] Despite their differences, pantheism was found among the Eleatics, such as Parmenides, the Ionians like Thales and Heraclitus, and the skeptics like Xenophanes, likely following in the influence of the Phoenician philosopher Sanchuniathon, who had criticized the Phoenician gods as personifications of natural entities and forces

places such as Sedona, Arizona in various rocks and canyons, where otherworldly forces can be felt but not seen in mortal form. Shamans are understood to use the World Tree to traverse to the "other side," the spirit-world, to gain wisdom for such things as curing ailments. In Norse, the World Tree was called *Yggdrasil,* while to the Saxons it was *Irminsul*, though it has a unique name in hundreds of different cultures. This world tree is often associated with a serpent, such as Jormunger. Jormunger,[1136] Loki's middle child, was a giant sea serpent in Norse mythology that bit its own tail like an *ouroboros*, a snake or dragon eating itself. Odin was said to have sacrificed himself upon this World Tree. These sorts of stories served the role of entertainment for those who were not in the know, while for the knowers they served the role of a mnemonic device, a mechanism for jarring one's memory to remember facts or principles. Those who understood the story's esoteric and often astrotheological content would be reminded by the storyline of the occurrences of natural phenomena, while others found amusement from the story itself. Underlying the whole story, however, its foundation, was pantheism.

Ephraim Squier, in his *The Serpent Symbol, and the Worship of the Reciprocal Principles in Nature in America*, suggests that, though humans developed along separate paths, these paths were more or less parallel and culminated in a psychic unity of humanity, which more-or-less took the form of a dualistic pantheism that venerated such things as the Sun, the phallus, serpents, and eggs as symbols of Nature's potency and creative power, or first causes, which were later balanced by more femine forces such as the Moon, the yoni, and so on. He quotes a "learned author," citing Cory, as having said that

> By comparing all the varied legends of the East and West, in conjunction, we obtain the following outline of the mythology of the ancients: and these, in mystic union, as the soul and body, constitute the GREAT Hermaphrodite Deity, THE ONE, the universe itself, consisting still of the two separate elements of its composition, modified though combined in one individual, of which all things are regarded but as parts.[1137]

His footnote, citing further Adolphe Pictet, compares this to the beliefs of the Celts, and, citing Tliss and Schelling, to the Cabiri, and his main text compares the beliefs of many other societies, such as the Greeks, Egyptians, Indians, and Mesoamericans. He expresses a perennialist conception of polytheology that is somewhat heno-pantheistic, and in which there are many principles of Nature that are ultimately resolved into the dualistic and, finally, monist principle, which Tliss apparently calls a "super-mundane God who ruled them all." He says that the "doctrine of the Reciprocal Principles of Nature [was] designated as active and passive, male and female, and often symbolized as the Sun and Moon, or the Sun and the Earth." He alludes to an Orphic-style egg as an early insight into humanity's early conception of the creative power of Nature. He says,

> We may in this manner rationally and satisfactorily account for the origin of the doctrine of the reciprocal principles. Its universal acceptance establishes that it was deduced from the operations of that law so obviously governing all animated nature, —that of reproduction or procreation.[1138]

In other words, it seems, the ancients recognized in reciprocity, the interaction of potent and fertile forces, often understood as Father and Mother, the generative or evolutionary principle, which would be later remembered in alchemy. This reciprocity was the body of the One.

[1136] Sometimes understood to be the same thing as Irminsul. Old Norse translates *Irminsul* to *Jormunr*.
[1137] Squier
[1138] Squier

Pantheism was the basis for much traditional religion and philosophy in the ancient world. Paul Harrison, a foremost proponent of naturalistic pantheism, gives us a clue in *Elements of Pantheism: Religious Reverence of Nature and the Universe* as to what pantheism is all about:

> The word pantheism derives from the Greek words pan (="all") and theos (="God"). Thus, Pantheism means: All is God. In essence, Pantheism holds that the Universe as a whole is worthy of the deepest reverence, and that only the Universe and Nature are worthy of that degree of reverence.[1139]

Pantheism means "all is God," but it's important to know that the "all" in question is not "all" as in every individual unit in themselves, but *The All* as in "the entirety of existence taken as an undivided whole." J. Allanson Picton, purveyor of pantheism, says,

> In this view, the man is the unity of all organs and faculties. But it does not in the least follow that any of the organs or faculties, or even a selection of them, is the man.
>
> If I apply this analogy to an explanation of the above definition of *pantheism* as the theory that there is nothing but God, it must not be supposed that I regard the parallelism as perfect. In fact, one purpose of the following exposition will be to show why and where all such analogies fail. For pantheism does not regard man, or any organism, as a true unity. In the view of pantheism the only real unity is God. But without any inconsistency I may avail myself of common impressions to correct a common mis-impression. Thus, those who hold that the reasonable soul and flesh is one man--one altogether--but at the same time deny that the toe or the finger, or the stomach or the heart, is the man, are bound in consistency to recognise that if pantheism affirms God to be All in All, it does not follow that pantheism must hold a man, or a tree, or a tiger to be God.[1140]

Paul Harrison points out that the word *pantheism* is fairly recent and that it springs up in disparate religions. It does so without a cohesive, singular tradition, and it does so because it is the natural and fairly objective conclusion of critical thinking. People living in and looking to understand the same Universe, if correct, naturally come to the same conclusions about it. The result is a convergent evolution of ideas, producing "multiple discovery." Paul Harrison says that pantheism is "a perennial heresy that has appeared in every world religion," but that it has also "appeared as a philosophy or religion in its own right." However, he says, "because the word Pantheism was not invented until the early eighteenth century, it rarely appeared under its own name before modern times."[1141] I include within the bounds of pantheism not only explicit pantheism but various forms of emanationist philosophies, some interpretations of monotheism and henotheism, and monist belief systems as well.

Pantheism is perennial, a pantheist might suggest, because it aligns itself with the perennial truth of existence. The Universe,[1142] the totality of all of existence, is, was, and always will be, containing everything within it and manifesting everything inside of itself from all directions. One may *feel* otherwise, but it is plain to see that pantheism is perennial, because it is a belief that springs up in a nonlocal fashion, meaning it does not require transmission from teacher to student, owing to its self-evidence in Nature, which is accessible to the senses and to the intuition of any individual who can deduce the truth for themselves. Like the perennial grasses, pantheism springs up everywhere, sometimes with distance between patches, and even when plucked away.

[1139] Harrison[1], 1
[1140] Picton, 8
[1141] Harrison[1], 13
[1142] Or Multiverse or Omniverse, etc. if you prefer

From traditional interpretations of pantheism, as well as from unique instances of insight, pantheism would inspire sages in religious and secular society. Pantheism is a sentiment expressed across the world in traditional religions and revival movements, as well as in secular philosophy, but ancient pantheism[1143] bridged pure philosophy and mystical spirituality, and grew from more primitive pantheism, which was often understood animistically or shamanically.

Unitarian minister, William Maccall, in "National Missions: a series of lectures," says

> It may be thought [...] that pantheism is fitted only for the East. A word will vanquish that notion. Pantheism is the natural religion of the whole human race [...] The Greek was as much a pantheist as the Hindoo [...] The German cannot utter his pantheism like either the Greek or the Hindoo, for he is in exile. He utters it, however, in a manner of his own[1144]

Pantheism would be found within secular philosophy as far away as China, such as in the thought of Lao Tzu and his philosophy of Taoism, but was a foundation among the secular Greek philosophers such as Thales, Xenophanes, Parmenides, Empedocles, Heraclitus, Melissus, Zeno, and Pythagoras, as well. Like the Phoenician philosopher, Sanchuniathon, and perhaps from his influence, the Greek pantheists would criticize the gods, at times claiming they represented interpretations of natural phenomena. The tradition of secular or Promethean pantheism would continue in later Greek philosophers (perhaps including figures such as Aristotle) and would find its influence also in Roman society in the philosophies of the Stoics and neo-Platonists. The Greek and Roman pantheists spoke in terms of a Monad, the One, or the All, or implied some other kind of unity of existence (or of existence and non-existence), while, in China, Taoists spoke in terms of the eternal *Tao*. Middle Eastern religions like Yazidism, Yarsanism, and Ishik Alevism may have their roots in the pantheistic Yazdanism.[1145] Existing religions with pantheistic interpretations include theistic religions such as Hinduism and Zoroastrianism, esoteric traditions within Abrahamic religions, neo-pagan revivalist movements such as Rodnovery, Assianism, Heathenry, neo-Druidry, and Wicca, as well as in interpretations of otherwise atheistic religions such as some versions of Buddhism, like Zen.

The "barbarian" societies of Europe, such as the Celtic, Germanic, and Slavic peoples—or, at least, their intelligentsia— were also inclined toward pantheism. European pagans living off of the land were referred to as *rustici*, or "rustics," by the Romans, and *pagan*—originally meaning "rustic" or "rural"—would come to mean the "folk beliefs" or "beliefs of the rustics," who tended to various sorts of Nature worship. German and Irish philosophies continued to carry in them a rustic pantheism into modern times. The lack of folklore from many of the traditional European belief systems is said by some to be evidence of Abrahamic repression, owing to the spread of Christianity. Nonetheless, pagan beliefs were carried on in many ways in the guild networks, which themselves had grown out of the pagan mystery schools, and who maintained their traditional gods as patron saints. Many of these guilds were forced underground at various points in history, becoming secret societies.

Pantheism would inspire both gnostic and agnostic positions, theistic and atheistic interpretations. In religious circles, pantheism was used to justify the belief in a monotheistic deity, and in secular circles it was used to dismiss claims about the gods in a skeptical fashion. One of these paths would be used to

[1143] Typically polytheistic, exoterically-speaking
[1144] Maccall
[1145] Mazdakism, another Middle Eastern religion, is associated with early communism, and may have had its influence on the commoners of Europe

justify religious authority, while the other was used to dismiss religion altogether, culminating in such skepticism, at times, that it concluded in a sort of "soft" atheism.[1146]

Among the religious, pantheism has often been reserved as an esoteric interpretation for the intelligentsia. Among the philosophers, the goal seems more to have been about spreading awareness or enlightenment. This conflict between philosophy and religion may have something to do with the Biblical story of the Garden of Eden and the fruit of knowledge of good and evil. Enlightenment has been associated with Lucifer, the "Light-Bearer," who is said to have presented himself as a snake in the Garden of Eden according to some interpretations of the literature. Of course, there are endless interpretations of this story. Opponents of the snake might suggest that the snake took Adam and Eve from a non-dualistic worldview to one filled with wars of relativity, whereas proponents of the snake might suggest that the snake took them from relativity toward the absolute Good.

Lucifer has been identified variously with Lugh, Lugus, Lug, Lleu, Loucetious, Loki, Hermes, Apollo, Fria, and others, and was often seen as a master of all trades, arts, and commerce, a wizard of sorts, as well as presiding over contracts, oaths, and good governance. He was often depicted as having three faces, as in a trinity. In *The Bible*, Lucifer is called *the Morning Star*. Venus, which is also associated with Lucifer, is also known as *the Morning Star*. In Canaanite mythology, suggests John Day and Gary Smith, the Morning Star was Attar (Ishtar), who had tried to usurp the throne from the storm god Ba'al,[1147] and upon his inability to keep the throne descended into the underworld. He was known for providing water to humanity, and as a warrior. *Ba'al* is likely a rendition of El or Elohim, part of early Hebrew henotheism or kahenotheism, later— in combination with the gods of the Jahwist, Deuteronomist, and Priestly sources— assimilated into the concept of a singular deity. Various Gnostic sects held that the Promethean figure of Lucifer was a revolutionary opposed to the Demiurge, the Demiurge (often associated with the Hebrew God) being responsible for having trapped Sophia— Wisdom— in a prison of flesh. The Greeks knew the Morning Star as *Phosphorus*, and the Romans or Latins as the improper noun *lucifer* (though acknowledged as a god at times). In Hebrew, *Lucifer* is *Hillel*. In his various forms, Lucifer has been identified with Venus, Mars, Mercury, Jupiter, the Sun, the Moon, the day sky, and the night sky.

While Lugh may have been the master of all trades, the horned god, Pan— often depicted as a mythical faun or satyr— was considered to be a pan-Celtic or pan-European deity of nature and procreation, perhaps being a masculized version of the Earth Mother, as might be suggested by Pindar's association of Pan with the mother goddess. *Pan* means all, but is interestingly cognate with the word *companion* as well. He was a rustic, folk deity that was not worshipped in temples, but in nature, and was especially prominent among mountain people such as the Arcadians of Greece. Like Lugh, Pan would be demonized. His image, the goat-bottomed and human-topped faun, goats intact, would be turned into the image of Satan.

In modern terms, Luciferianism has many meanings, often unfounded in history and mythology. Sometimes it is equated to Left-Hand Path positions such as Satanism, itself having many meanings and interpretations. Luciferians and their opponents will variously suggest that Lucifer is the Demiurge or that Lucifer is opposed to the Demiurge, with some, such as Rudolf Steiner, placing Christ between Lucifer and the evil god, in Steiner's case *Angra Mainyu*, the evil god of Zoroastrianism. Some renditions of Christianity have been interpreted as Luciferian. On the other hand, many atheists have

[1146] "Soft atheism" referring to disbelief in God, not the rejection of God's possible existence
[1147] Often translated as "Lord" or "Owner," and sometimes known as *Moloch*, the Phoenician god to which children were sacrificed

traced their own anti-theism to Luciferianism, preferring to eschew mythology and theology altogether. Perhaps the unifying metaphysic of Luciferianism, however, would be that Lucifierians, properly-speaking, tend to be monists who recognize duality within oneness. As such, they embrace the mundane, that which is stretched between the profane and the sacred, and recognize that bad or evil things are necessary to existence as it is. However, this is not to suggest that Lucifierians are motivated by evil or wrongdoing, but rather they recognize that within the framework of the Universe there are competing interests—what may be good for oneself may be bad for another—, and that these interests are co-defining and ultimately non-dual. It is in non-duality that Luciferians share ground with crazy wisdom, which is also non-dual. However, Luciferians, rather than promoting subjectivism, as might be found in many traditions of crazy wisdom, promote rational as well as moral inquiry. Strangely, this may itself be considered a form of crazy wisdom, not because there is anything actually crazy about it, but because *crazy wisdom*, used *colloquially*, refers to any kind of wisdom that is outside of the norm, and not just mania. People who go about rational plans, whose goals are not known to others, may appear to be mad to those others at times, especially if it appears one is making a sacrifice for no apparent reason. Also, going against established traditions to follow one's own common sense and logical deductions appears strange too. In this way, rationalism was a development away from crazy wisdom while also still being affiliated with it in the public mind. Even worse, figures of enlightenment, such as Prometheus, Lugh, and Pan, have been turned into the devils of more recent, Abrahamic traditions, for their having shared wisdom with humanity. What tends to set the Luciferian apart from the Satanist, however, is that, while the Luciferian accepts the dark side of things as a subjective fact, they are nonetheless driven by the light side of existence and prefer to engage in harm-reduction and increased morality, so long as that morality is rational. The major tool for achieving this, for the Luciferian, is by way of agreement. Agreement, or contract, sorts things out such that arrangements are good for all involved, and the bad can be decreased. By accepting the existence of the bad, the Luciferian believes it can be managed or even eliminated. It is for this reason that Luciferians are often seen as contenders with God, because they believe that one becomes godlike through humanistic transcendence. Many rationalist pantheists, in their rejection of a deity greater than the Whole, and in their rational mysticism, have been considered Luciferians.

Anglo-Saxons, Jutes, Franks, and Normans

The original name of England is said to have been *Albion*, related to the Albani people, perhaps otherwise known as *Britons*. The Picts and Gaels similarly established the Kingdom of Alba, later called *Scotland*. *Albania* is also a country in Southeastern Europe. The Albanians are of relation to the Cyclopians of the Balkans, including the proto-Greeks and proto-Thracians, their language an isolate within the Indo-European language superfamily. Laurence Waddell had argued, in *Phoenician Origins of the Britons, Scots, and Anglo-Saxons*, that Syrian, Anatolian, and Canaanite peoples, including Trojans, Hittites, and Phoenicians, had long ago populated Ancient Britain.[1148] It is likely that the Britons, or Albani, had been Beaker-like people of a Basal Eurasian, perhaps Alpinid, sort, which would be followed up by Mediterranoid and then Nordid superstrates. *Albani* is related to *albino*, and the Basal Eurasians were likely the first albinos. *Alpine* is also of relation to *albino*. The Britons, probably a Celtic group that was an admixture of Albani and Celtic Urnfield- or Hallstatt-derived peoples and Phoenician Veneti, would eventually be conquered, enslaved and then put under feudal control, by the Romans, and then later by the Anglo-Saxons (as documented by Gildas) and the Normans. England is no longer called *Albion*, but instead gets its name either from the Angles, the god Ing, or both.

[1148] He had also argued for pan-Sumerianism, the idea that most well-developed ancient cultures had come from Sumerians

The *Angles*, or *Angli*, a Germanic tribe, came from the Suebi, a people considered sometimes to have been Celtic, but otherwise Germanic, similar in some respects to the Belgians, but likely to have involved some Phoenician or Finnic admixture. According to Gary and Clive, in "Tribal History of the Angles," the Angles come largely from around the Baltic Sea, and have some relation to the Uralic and Altaic people, such as the Finns, by way of the Frisian, Finn Folcwalding, as do the Jutes or Danes. They suggest that "Germanic and Norse magical tradition could originate with the Finns/Kvens because it shows the characteristics of the shamanism of Uralic and Altaic speakers and related groups across Northern Eurasia."[1149] The Angles had banded together with the Saxons, becoming the *Anglo-Saxons*. Valentyn Stetsyuk suggests, however, in "Alans, Angles, Saxons," that the homeland of the Anglo-Saxons, during the Scythian times, was to the West of the Dnieper, East of the Sluch River. He suggests a strong connection between the Anglo-Saxons and the Iranic confederation of the Alans as well.[1150] This is likely one of the areas to which the Israelites (also called *Samarians*) had fled to after having been driven out by the Assyrians. Here they would apparently be associated with names such as *Saka* and *Sarmatian*, as well as *Alan*. The first mention of the Saxons in history was by the Roman-Egyptian, Ptolemy, who knew them as *Saxones* in his work *Geography*.[1151] Sometimes the *S* would be dropped in favor of *Axones* or *Aviones* more simply. Early on in the Middle Ages, the Saxons lived in Northern Germany around Holstein and the Elbe (or Alba) River, in a region known as *Albingia*, before spreading out into Old Saxony, which would include Angria as well as East and Westphalia going into Northern France into the North Rhineland. According to Widukind, a Saxon youth had bought grounds in Thuringia (Germany) with gold, pleasing the inhabitans until he had dug up and spread as thinly as possibly the soil upon surrounding lands, fortifying them and claiming absolute domain over them on the grounds that his original purchase was now imbued in them. After this, the original inhabitants regretted accepting gold for earth.[1152]

[1149] Gary and Clive

[1150] See Stetsyuk[2]

[1151] *Saka* is often traced to various difference Indo-European sources, including **sek^{w}* and **sak or *sag* and **seh$_2$g, *sh$_2$g,* or *sakana*. **Sek^{w}* means variously "to persecute" or "prosecute," and "pursue," and perhaps serves as a base for what became *association* (as by way of cognates to *sect* or *society*) and *suit* as in "lawsuit." It would also refer to a "case" or situation and "thing." Similarly, Middle English *sake* refers to legal disputes, and Old English *sacu* to a legal dispute or accusation. Germanic *sache* also refers to a Thing or something worthy of investigation, and is common to the spelling of Saxon as *Sachsen*. *Sachsenspiegel*, for instance, was the codified laws of the Saxons under the Holy Roman Empire. In German, this comes from proto-Germanic **sako*, which similarly refers to a charge or accusation, in common with Norse *sok* and Dutch *zaak,* coming from proto-Indo-European **sag*, meaning "to seek out." **Seh$_2$g* also means "to seek out." *Saxon* is typically said to come from *sax*. The word *sax*, derived from one of these others, means "stone knife," and may be derivative of Saka, Sakha, or *Saxa*, the Saxons, if not the other way around. In Anglo-Saxon society, especially around the Dane Law, a *sokeman* was a peasant who was free to hold a court, *sok* or *sak* referring to a court. *Soc and sac* referred to a bundle of rights that a sovereign had with regard to holding courts without regard to outside jurisdictions. *Sax* could also be a reference to dogs, such as those of the Sakha.

Different groups have their own speech patterns, and brought these in when pronouncing words another may have initiated, such that the shared use was never monolithic and always required some interpretation because always being different from the beginning owing to different accents or dialects in approaching the emerging language. It is *creole* not in the sense that it produced a monolithic pronunciation, but in that it produced a mutually-intelligible set of utterances from out of pidgins used over a long period of time, such that it became a regional pidgin functioning as a mutually-intelligible creole. In this way, different approaches to a root, such as **sek^{w}* and **seh$_2$g*, may be attempts to say the same thing with different accents or pronunciations, owing to established manners. That is, each people may have brough to the emerging creole, from out of the pidgin, distinct consonants (*k^{w}* vs. *g*), distinct laryngeal patterns, distinct morphological derivatives, and distinct reflexes, which were nonetheless able to be mutually understood because of overall similarity.

[1152] Excursus: Important Anglo-Saxons have included Widukind, Alfred the Great (who promoted literacy before the Norman invasion), Aethelsted, Edward the Confessor, Hugh of Saint Victor and Adelard of Bath (Anglo-Saxon

The Angles and Saxons, the main peoples associated with the Anglo-Saxons as a whole—though there are certainly others, and many depending on how wide the grouping is made to be—, appear to have together been a Germanic tribal confederation between these main two groups and their associates, likely having Iranic elements.[1153] Among these associates would be the Frisians and the Jutes. *Frisians*, named after the goddess Fria, were a Germanic or Belgic people originally derived from the Frisii, but being admixed with Saxons and Angles, who would populate the Netherland and Germanic zone of Frisia. Although there also seems to have been some distinctions made between Anglo-Saxons and Jutish or Jutish-derived peoples, the Jutes are also included among the Anglo-Saxons. While the Frisians, Angles, and Saxons were from mainland Germany the *Jutes*, another Germanic[1154] people, lived on the peninsula named after them, *Jutland*. The Romans may have known them with the *J* dropped, or pronounced as a *Y*, as *Eudoses* or *Eones*, their name being associated with giants.

Sometimes the Franks, Danes, and Normans— other Germanic peoples— are counted among the Anglo-Saxons, but generally are put with with into larger categories instead, such as *Teutonic*. Either way, they are important to the history of the Anglo-Saxons. The *Franks* were a Germanic tribe that originated near the Radhanites of the Rhine, and are likely of some admixture with them. The Frankish King, Clovis, had been a convert to Christianity, and some centuries later Charlamegne claimed to be descended from Judah from the line of David, suggesting he identified as a Jew. He had been crowned by the Pope to be the Holy Roman Emperor. A separate lineages traces the Franks to the Trojans or possibly-related Etruscans, by way of a mythical King Francus and by association of the name *Paris*, which features in Trojan mythology. Meanwhile, some Vikings, Jutes known as *Norsemen*, "men from the North," had settled into Northern France, where they would become known as *Normans*, adopting Frankish culture and becoming Christianized.[1155] These events would drastically impact the Anglo-Saxons. The Saxons had gradually been displaced from their home in Holstein by Slavic Wends (who would later be displaced by Danes) allied with the Franks under Charlemagne of the Holy Roman Empire, remaining in Saxony and moving on into England, leaving the Anglo-Saxon leader Widukind defeated in the Saxon Wars and leading to the conversion of the Saxons. Gildas suggests that the Saxons had been invited by the Britons to help secure the lands against the invading Picts, after the retreat of the Romans, after which the Saxons turned on the Brits.[1156] The Anglo-Saxons had already been somewhat Romanized before taking over Britain, some of the men having served in the Roman army as mercenaries. Romanization had coincided with stratification and the appearance of kings.

As to how the Angles, Saxons, and Jutes all came together, Gary and Clive suggest that "all having the same God must have helped with this," suggesting that the Angles, Saxons, and Jutes all worshipped the god named *Ing*, "the one thing" people in what would become England "had in common," and that this

---

philosophers), and many others. Schleswig-Holstein (Haithabu-Hedeby, Eider Canal, Danevirke, Seebull, Selkborg, Nydam Mose, Osterrönfeld, Meldorf) is an Anglo-Saxon archaeological area, as is North Sea Coast of the Netherlands (Tongeren, Velsen, Domberg, Elsk, Elsloo, Voorburg-Arentsburg, Heerlen-Cloppenburg, Valkenburg), and Gudme/Gudhem, Harzburg-type Settlements, Sutton Hoo, Benty Grange, Coppergate, Wollaston, Shorwell, and Staffordshire, among many others, are also noteworthy.

[1153] *Saxon* itself is often treated as more of a tribal affiliation rather than a strict, racial ethnonym

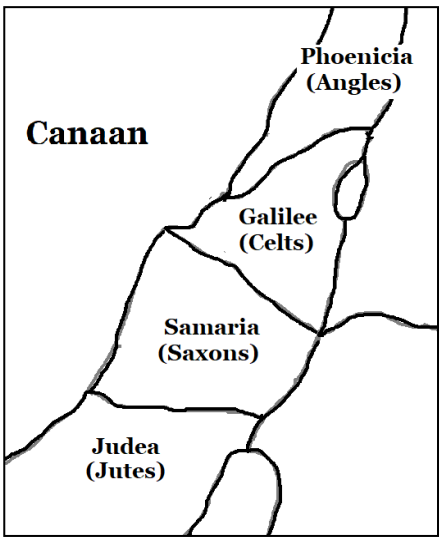
[1154] Possibly Iranic

[1155] The Norman founder and first ruler, Rollo, was known, however, to give human sacrifices while courting Christianity

[1156] In more modern times, David Hume wrote *The History of England* and Edward Gibbon wrote *The History of the Decline and Fall of the Roman Empire*, while Sharon Turner authored *History of the Anglo-Saxons* and Augustin Thierry wrote about the Norman Conquest of Anglo-Saxon England in *History of the Conquest of England by the Normans*. Saxon society went through various political renditions, including as relatively free societies but also chiefdoms, kingdoms, duchies, and oligarchic republics.

is the source of the name of England, not the Angles' presence there.[1157] The Angles and Saxons would become especially associated with their home in England, taken from the Brits, where they would become the English. The Jutes would move into Scandinavia, becoming the Norwegians, those that remained, associated with the Tribe of Dan, were called *Danes*, giving their name to Denmark. The Frisians would come to populate England with the other Anglo-Saxons.

The Angles and Saxons might be most readily associated with the Israelite-derived Scythians, while the Jutes have some relation to the Judahites and the Radhanite Jews who were stationed in Germany and France. As such, there is a historical rivalry to be understood between the Jews, or Jutes, and Isaac's sons, the Saka or the Saxons ('saac's sons). The mixture of Finnish, Jutish, and Saxon peoples represents a mixture of Phoenician, Jewish, and Israelite peoples, together known as *Canaanites*. The Frisians may have been derived from Phrygians,[1158] their homophone, and so may represent an Illyrian input into the group. There may have also been some Celtic (and possibly Baltic) influence in the Anglo-Saxons, by way of assimilation of groups such as the Chauci, Cimbri, and Teutons, as well as other early Belgic groups.



There are many people besides the Jews who are to be considered Israelites-proper, or the sons of Jacob. Jews are the sons of Judah, which is only one of the Twelve Tribes of Israel, or those who lived in their kingdom, the Judahites. Aside from one other, the other Israelite tribes became lost,[1159] becoming various tribes in the Scythian cultural complex, perhaps especially worth mentioning the Saka, who would later become known as the *Saxons* or— according to Edward Hine's interpretation— "'saac's sons."[1160] Albinus is widely quoted as having said that "the Saxons had come from the Sacae [Saka] of Asia" and Pliny and Ptolemy have been quoted as having also affirmed that the Saxons were derived from the Saka, while Herodotus describes their origins as being in the Kura-Araxes.[1161] But they would end up in Canaan. Anglo-Saxons are not gentiles, then, because they are Israelites. This has been well-documented, by people such as Richard Brothers, Edward Wheeler Bird, John Wilson, and Edward Hine. Nonetheless, the world has come to believe that the Jews are the only Israelites left and that everyone else is a gentile.

The current conflict, if there really is one, between Jews and gentiles is usually traced back in *The Bible* through to the story of Jacob and Esau, sons of Isaac, son of Abraham. Isaac had, himself, been spared by Abraham, who transgressed on the Canaanite ways of sacrificing the first-born son.[1162,1163] Abraham

[1157] However, Tacitus said that the Aviones, who may be the Saxons, were worshippers of Mother Earth, along with the Angles and others

[1158] Karl Otfried Muller, for instance, noticed common words between the Phrygians (Frisians) and German in his studies on the Dorics of Greece

[1159] Or remained as Samaritans

[1160] It has also been speculated that the Saka had merged with the Wusun of Central Asia, becoming the Saxons or *Sak-sun*. The Wusun were from Northwestern China along Silk Road hot spots and were said to be tall, green-eyed, and red-haired, probably being slightly-Turkicized Indo-Europoids. They may have been known as *Issedones* to the Ancient Greeks. They were known allies of the Han.

[1161] See Hine

[1162] This seems to have been in conflict with the ways of the Old World Order, of the heir being the first-born, which Abraham seems to have initiated

had, instead, passed a blessing on to Isaac, saying that the land of Israel would be his. Isaac would, in turn, pass this blessing down to his offspring, to the first-born, Esau. However, *The Bible* tells that Esau, who is generally considered to represent a gentile for his having had red hair, had fallen for a trick by his brother, Jacob, who had sold Esau a bowl of lentils for this birthright, Esau apparently not taking the deal seriously despite their mother, who favored Jacob, having had witnessed it. When the time came to bestow the birthright blessing, an aged and blind Isaac would unknowingly give the blessing to Jacob, who had pretended to be Esau by wearing skins with hair on his arms, Esau having been a particularly hairy huntsman (and Jacob a shepherd and businessman). Jacob had the support of his mother. Esau would show up to receive his birthright after it had already been granted to Jacob. The birthright was apparently a means of bestowing chieftainship, putting Jacob in command of the people and leaving Esau's progeny to establish the Edomites. Esau's progeny were the Edomites, who, after having their nation destroyed, were forcibly converted by the Hasmonian Dynasty of Judea (which was established after the Maccabean Revolt) to Judaism. If *gentile* is anyone who is not Jewish, then, as it has been established since the rise of Rabbinical Judaism and Christianity, then all of the Hebrews born to those outside the line of Judah are gentiles, whereas Edomites are not. However, if *gentile* is anyone who is not born an Israelite, son of Isaac and Jacob, then this does not include the Saxons, but does include the Edomites. If *gentile* is anyone who is not a Hebrew, then just about everyone alive in Europe and Asia today is probably not a gentile. Michael Bradley holds that Esau, the red-body-haired brother, was reference to an atavistic recurrence of a more-or-less pure Neanderthal, suggesting that Hebrew texts actually speak of many Esaus.[1164]

Jews, or Judahites, and Anglo-Saxons, or Israelites of Samaria, Galilee, and Phoenicia, are competing for power with one another, two factions of the *Vaishya* and two divisions of the once United Kingdom of Israel, as it existed under Kings Saul, Ishbaal, David, Solomon, and almost by Rehoboam. The prophet Samuel had, according to *The Bible*, begrudgingingly accepted the demands of the people to have a king for the first time. King Saul, as a result, was selected by *cleromancy*, or lottery considered to reveal the will of God. Before this, the Israelite people—both those that would become the Judahites and those who would become the Samaritan Israelites— had lived together under a loose confederation, presided over by officials known as *judges*, called the *Twelve Tribes of Israel*, named after Jacob, son of Isaac (son of Abraham) and brother of Esau, who had been given the name *Israel*, according to mythology from *The Bible*, after having wrestled with an angel. The *Ten Tribes of Northern Israel*, or Samaritan Israelites, became dissatisfied with the rule of Rehoboam, successor of Solomon, and the Ten Tribes of the North would split from the *Two Tribes of the South*, the Judahites, dividing into the Kingdoms of Israel and Judah. Eventually, the Kingdom of Israel would be conquered by the Neo-Assyrian Empire and deported, giving way to the condition of the *Ten Lost Tribes of Israel*; and the Judahites would be conquered and put into bondage in Babylon, from which they derive novel characteristics that would distinguish them from the other Israelites. The Ten Lost Tribes would scatter and become various Scythian groups such as the Sarmatians and the Saka. The Judahites became Radhanites.

This is, of course, assuming that mainstream theories have been established in good faith, which may not be the case. Thomas L. Thompson, in *The Mythic Past*, denies the existence of a historical Israel

---

[1163] The difference between the pagan and the Abrahamic form of sacrifice was apparently that the pagans sacrificed to satisfy the needs of the "gods," such as the Titans, while the Abrahamic people sacrificed without need to satisfy any needs of their deity, but rather to show thanks regardless to a deity that did not need sustenance from their behavior. Unlike the Phoenicians, their neighbors, the Israelites sacrificed animals instead of children, following after Abraham.

[1164] See Bradley[1]

existing in Canaan, suggesting it is entirely mythological, including the United Kingdom. There have been many attempts to locate the original Israel elsewhere, including attempts by Christian Identitians to locate it in England, Scotland, or Ireland, and by rogue Mormons to locate it in the Americas.

Early Saxons and other Germans oriented their economy on cattle similar to the Phoenicians, they buried their dead in pits and kurgans as did the Yamnaya (and the Saka), or at sea like other pirates, and they lived in pit-houses called *grubenhäuser*, also like the Yamnaya and Saka. These pit-homes were described by Tacitus, when he says,

> It is well known that none of the German tribes live in cities, nor even permit their dwellings to be closely joined to each other. They live separated and in various places, as a spring or a meadow or a grove strikes their fancy. They lay out their villages not as with us with closely-jointed houses, but each one surrounds his dwelling with an open space, either as a protection against conflagration or because of their ignorance of the art of building. They do not even make use of rough stones or tiles. They use for all purposes undressed timber, giving no beauty or comfort. Some parts they plaster carefully with earth of such purity and brilliancy as to form a substitute for painting and designs in color. They are accustomed also to dig out subterranean caves which they cover over with great heaps of manure as a refuge against the cold and a place for storing grain, for retreats of this sort render the extreme cold of their winters bearable and, whenever an enemy has come upon them though he lays waste the open country he is either ignorant of what is hidden underground or else it escapes him for the very reason that it has to be searched for.

The Saxons are known for having maintained a strong tradition of common law, perhaps coming from a time before the United Kingdom of Israel, wherein judges were the final authorities on civil matters, possibly as adapted from groups such as the Hittites, who were also understood to have practiced a system of codified common law. These kinds of systems would often be associated with liberty, because one was treated as being at liberty to do as one wished, and only judged upon the instance of some actual harm done. This was in contrast to systems of statutory law, which dictated behaviors were acceptable and not. The long tradition of associating common law with liberty is made obvious in the *Phrygian cap*, the pointed red hat often associated with figures such as elves or gnomes, also known as a *liberty cap*, worn as a symbol of Freedom and Easterly origins by republican revolutionaries. The Phrygians had taken the Hittites's place in Anatolia after the Bronze Age Collapse, likely adopting much from their culture. Frisians, the inheritors of the Phrygians, and close relatives of the Saxons, are also associated with liberty.

The Greek and then Roman civilizations persisted for a good while, developing most of what we associate with Western society today. Nonetheless, around the same time as the Upheaval of the Five Barbarians in China, the Roman Empire fell to the loosely joint efforts of heretical Christians, pagans from Germanic, Celtic, and other "barbarian" tribes, Jews, and from piracy and cultural and economic breakdowns, among other reasons. This would end the classical period of Mediterranoid antiquity, and put Europe into a period called the *Dark*, *Middle*, or *Medieval*, *Ages*. In this period, there was a generalized reduction of philosophical and political thought carrying over from classical antiquity, and many elements from Roman society were diminished in a return to traditional ways from European pagan societies. Various barbarian kingdoms developed in the absence of, and between, Roman (or Byzantine) control, perhaps the most important being Nordic, Germanic kingdoms that developed into the Frankish and then the Holy Roman empires. In particular within the Nordid race that conquered Europe, it was the Anglo-Saxons and the Jutes who appear to have been the most influential of the Germanic tribes or ethnicities, essentially gaining world dominance by way of the waterways. Of course,

other Germanic as well as Gallo-Romantic and additional tribes would have great influence as well, but it would be the Anglo-Saxons and Normans who would especially become dominant over the others as well as over Western Europe as a whole.

At some point, in their united interests against the Roman Empire, the Judahites and the Israelites, or the Jutes and the Saxons, under their various new identities— often being associated mythologically with *therianthropy*, or "shapeshifting"—, and then the Phoenicians, would combine their efforts once more, giving way to the fall of the Roman Empire. This occurred through a combined effort of peoples variously called *Huns*, *Alans*, *Goths*, *Jews*, *Carthaginians*, and a number of other terms, but being largely united in a Levantian-Caucasian home in Canaan and the surrounding areas, or otherwise by Steppe culture, as was the case with the Huns, or, in China, the Han.[1165]

Like the Phoenicians with whom they shared a familial relationship, the Germanic sea-raiders, or pirates, called *Vikings*, had rowed and sailed vessels with carved animal heads, often dragons or sea serpents, at the front, and were carried by red-and-white striped sails. The Angles and Saxons, among the Vikings, had been Indo-European speakers having much relationship to the Scythian or proto-Scythian people. They had followed the Celts into the area, the Celts having also been a Phoenician and Scythian-related people-group that had developed from out of the offspring of the Yamnaya, such as the Cimmerians,[1166] as well as from Neolithic cultures such as the Corded Ware and Beaker People.[1167, 1168] The aristocracy of Europe was established largely through maritime dominance, the march of cities followed soon after, and then the factory system (called such because of the *factors*, traders for unknown superiors, who were associated with them) after that.[1169] It was essentially Nordic Vikings—among them the early Anglo-Saxons and what would become the Normans—, whom had inherited the Phoenician seafaring tradition as sea- and river-fairing Vikings, who would establish themselves as the rulers of Europe and then the Americas. The relation of Vikings to Jews (Jutes) might be seen when one considers that when anti-Semitism had come to a head during World War II, Denmark is understood to have saved around ninety percent of its Jewish population from the so-called genocide. *Chicago Jewish*

[1165] The Chinese have legends of *cyanthropy*, or the turning of humans into dogs, sometimes involving sex between the cyanthrop and a human woman

[1166] John Pinkerton affirmed the Celtic identity of the Cimmerians, V. Gordon Childe affirmed them as pre-Scythian Thracians, and they are widely-regarded as proto-Scythian or a part of the Scythian cultural complex

[1167] The Celts, however, tended to be of the Alpine variety of Caucasoid, whereas the Germanics brought about the Nordic phenotype

[1168] Both *Scot* and *Saxon* are said by some to be etymologically- or philologically-related to *Scythian*, although *Saxon* is also said to mean "Isaac's sons," as in "'saac's sons." This is the prominent perspective, for instance, of the radical Christian Right, which has produced near-anarchist or substantially-anarchist sentiments related to concepts in Saxon common law, giving rise to movements such as the Sovereign Citizens and the Freemen on the Land. Similar in some respects to certain Moors, these movements make legal arguments related to jurisdiction and natural law, and have been involved in civil disobedience and so-called "paper terrorism." The similarity to anarchism comes from the common law tradition, which anarchists such as Lysander Spooner approved of, and from their concept of *voluntaryism*, their anti-elitism, and their federalist understanding of the body politic, wherein it is understood that the federal government is actually subservient to the lower levels of government, with the "freeman" or "sovereign," similar in idea to the *sovereignty of the individual* promoted by anarchist Josiah Warren, being the center of authority.

[1169] King David, of the Davidian Revolution in Scotland, was the Normanized Gaelic creator of the burgh system, which gave legal monopolies to towns that the King could more easily tax and where he could bring his wares to market more easily. This was kind of a predecessor to the factory, but created a class of merchants that were privileged. With the spread of burghs came Gregorian reforms, Norman influences in governance, feudalism, and etc.

News asks, "Are Vikings Jewish?" They allude to the possibility that this may be so, saying that some Vikings might "carry genetic markers from Southern Europe and Asia."[1170]

Bedouins, Radhanites, Slavs, and Turks

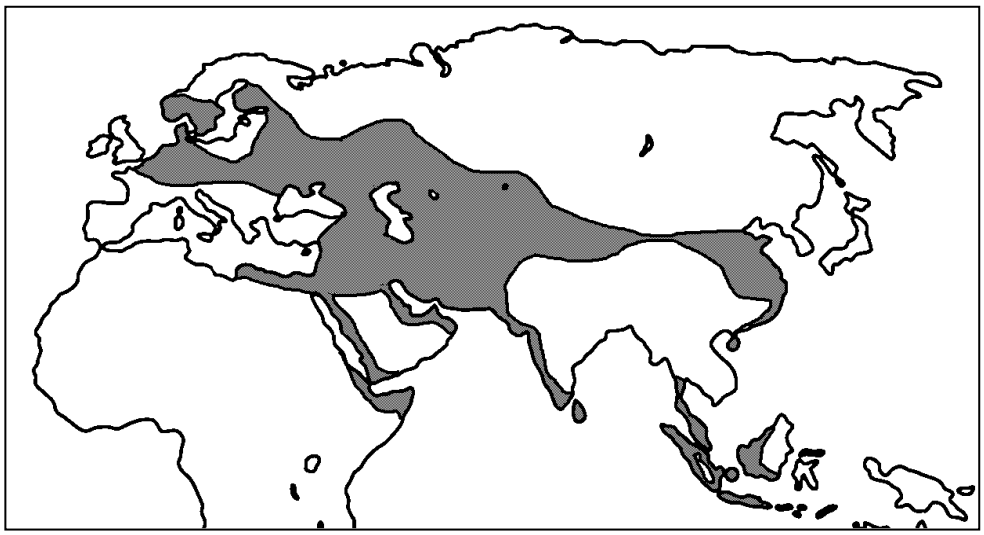
Bedouins are nomadic Arabid merchants who travel by way of camel from oasis to oasis, herding goats and trading, having long been very prominent in the deserts of Arabia, the Middle East, and North Africa. Though having had taken to a number of pagan deities in the past, they have since been largely united into the monotheistic faith of Islam. Bedouins adhere to a hierarchy of loyalties, saying "I am against my brother, my brother and I against our cousin, and we are together against the stranger." This provides the foundation for Bedouin conceptions of law, promoting self-help and duty to others. They would tax passers by and demand tribute from neighbors. Bedouins have traditionally been relatively stateless people, excepting tribal control of oases, though they have been governed by chieftains or *sheikhs*. Like the Celts or Scythians, Bedouins were known for "friendly raids" on one another, a practice called *ghazw*, and are similarly derived, at least in part, from the Hebrews.

Radhanites were nomadic Jews who made exchanges along the Amber Road and Silk Road, going from Scandinavia all the way to China, by land and by sea. Like Bedouins, they made use of camels on their journeys by land through the dessert.[1171] The name *Radhanite* has been said, by people such as Cecil Roth and Claude Cahen, to come from the Rhone River in France, which has been considered a Radhanite stronghold, and which is known as *Rhodanus* in Latin or *Rhodanos* in Greek. Alternatively, *Roden* is the name of a location in Sweden, from which the Rus may have come. However, these locations may derive their names from a location in Mesopotamia, called *Radhan* or *the Land of Radhan*, not far from Baghdad.[1172] They are Babylonian Jews. Radhanites spoke a myriad of languages, including European languages such as Roman, Frankish, Spanish, and Slavic, according to Ibn Khordadbeh. He says that they traveled from France or Spain to Morroco, Tangier, and Cairo, and from there on to Baghdad and then toward India and China, saying, as popularly reported, "sometimes, also, they take the route behind Rome and, passing through the country of the Slavs, arrive at Khamlidj, the capital of the Khazars."

[1170] Chicago Jewish News

[1171] Radhanites would often serve as mediators between Christian and Islamic merchants, who could not or who refused to trade directly with one another. They would, for instance, sell Islamic slaves to Christians and Christian slaves to Muslims. They would also sell pagan slaves from Eastern Europe, such as Slavs.

[1172] The Nestorian Christian Church is also found in Radhan



Primary trade range of the Radhanites
(excluding sea routes of the Mediterranean and Atlantic)

Slavs are a people who are closely related to the other Europeans, including the Greeks and Romans, Thracians and Scythians, and Celts and Germans, with all of whom the Slavs shared an affinity as Indo-Europeans. Perhaps the defining feature of the Slavs is their input from the Veneti, or Phoenicians, though they might be considered to otherwise be derivative largely from the Scythian cultural complex.[1173] Indeed, the Slavs have often been traced back to this particular tribal influence, though, like all peoples, the Slavs are actually a mixed people coming from more than one tribe. The Veneti, though, would be a particularly influential element, and for this reason the Slavs would come to be known also as *Wends*, derivative of *Veneti* or *Venedi*, and also as *Finns* at times, though Finnish and Slavic are different languages. The Veneti developed into groups such as the Slovenes and Sclavenes, perhaps where the word *Slav* comes from.

Slavs are natively situated in Central and Eastern Europe primarily, having come from the old homelands of the Aryans, Thracians, and Scythians, including in areas such as in Poland, Ukraine, and the North Balkans, but have since spread out across Eastern Eurasia and into the full extent of Russia. Of course, ethnic Slavs includes people of all racial categories who speak the Slavic language as their native tongue and who have grown up as a Slav. If there is such thing as a racial Slav, they are especially situated near the ancient homelands. But such a Slav is the result of many peoples. *Galicia*, for instance—home to Gauls or Celtic peoples—, is found not only in the Celtic home of Spain (North of Galatia, another homeland of Celts in Anatolia), but also in Central Europe, spanning between Poland and Ukraine, and such Celts have since been subsumed into the larger Slavic grouping. Similarly, the Scythian, Germanic, Iranic, and other elements of Slavic zones have been largely assimilated or eradicated.

[1173] Some historians suggest that Phoenicia included all of Canaan, the Red Sea, North Africa, and up into the Black Sea and into Ukraine. In such a case, the Israelites and Jews, the Scythians, and perhaps even the Bedouins might all be considered to be Phoenicians.

General range of the Slavs

The *Mordvins*, or *Mordovians*, a proto-Slavic people, are likely descendents of the Scythian Andropophagoi, as they are living in their ancient homelands (as well as in Samara). They are racially of Lappoid, Alpinid, and Pontid proto-Nordid stock. Ethnically, they are Uralic or proto-Finnic, considered to be of an especially Volgid phenotype, though they have been partially Turkicized and greatly Slavicized. They divide themselves into two major sub-ethnicities, the Erzya and the Moksha, considered genetically distinct, though others include the Shoksha, Qaratays, and now Russian-assimilated Teyukhans. Their social structure is patriarchal, with fathers ruling and first-born sons administrating. They practice a pantheistic religion called *Ineshkipaza* that has archaic pagan elements carried over from the Neolithic era, involving the veneration of ancestors and the worship of the Sun, Moon, Earth, and natural forces. A newer version of it is called *Mordvin neopaganism* or *Erzyan native religion*. They were contemporaries of the Khazars and direct neighbors of them, as well as to the early Slavs and Finns, perhaps representing a member of the racial complex from which the Alpine expansion occurred. The Sarmatians had some conflicts with the Moksha in the area, as well as with some fellow Scythians. Mokshas had become, with the related or derived Slavs and others, among the most powerful ethnic groups in Eastern Europe.

The homelands of the Slavs have long been different from those of others in a number of ways. That they were inhabited by Phoenicians is not particularly unique, nor the mixture of Phoenicians with Scythians, as had also occurred with Celtic and Germanic peoples. That it is perhaps dominantly Phoenician, in common with the later Venetians, does seem somewhat unique. The Phoenicians seem to have made conquest of the Black Sea and perhaps also the Caspian, having at least made use of them, and exchanging with other Phoenician-mingled peoples, the Germanic Vikings, by way of the Dnieper and Volga Rivers, among others. This mixture of the Slavic and the Germanic peoples, especially, would establish the Rus, from which the Russian people would come. Like the Khazars and other Turks, the early Rus interestingly were governed by a *khagan*, or "King of Kings." Kievan Rus, following after the Rus Khaganate, would become the stronghold of the Rus, a multi-ethnic state governed by a Germanic (primarily Swedish, perhaps) ruling class which had merged with and assimilated into the Slavic and Turanian cultures of the people whom they had conquered, with Slavic becoming the dominant common language. Valentyn Stetsyuk points out, in "Anglo-Saxons at Source of Russian Power," that much of the *toponymy*— topographic or geographic naming— of Russia, especially surrounding Moscow, is Anglo-Saxon in origin, demonstrating a rich map of locations given Anglo-Saxon names. Stetsyuk attributes the power of the Russians to Anglo-Saxon influences, downplaying the influence of the Rus and Slavs, though they were certainly involved.[1174]

[1174] See Stetsyuk[3]

Madison Grant, in *The Passing of the Great Race*, had described the Slav as essentially an Alpinid peasant stock, the least impressive of the three major races of Europe, which had been partly responsible for the setbacks of the Nordid race by way of its expansion into Europe, especially its displacement of the Nordid from what I have identified as the Jat Belt going into India, the Slavs having cut the Nordid-proper off from the Indo-Nordid, largely through displacement of the Pontid[1175] and proto-Nordid dominance of the steppes of Eastern Europe, and Western (and parts of Central) Asia. As Madison Grant saw things, the Slavic Alpinids have long been in a process of replacing the much nobler Germanic Nordids, having generally replaced or overlain what other authors might call *proto-Nordids* or *Pontids*, with the Teutonic and Scandinavian peoples, including Anglo-Saxons, what some might say are *true Nordids*, having been responsible for a limited counter-assault into the lands of the Alpinids.

With consideration toward what Stanislav Szukalski said about the Yetisyn, he describes the tactic of the Yeti, and by extension the Yetisyn, as that of a cuckoo bird, source of the word *cuckold*, referring to the husband of an unfaithful wife. He says, in "Anthro-Political Motivations," that

> It is known that the cuckoo never nests but, like all nomadic, non-home-making creatures, finds a small victim to work for it. It waits till a small bird, like the meadow pippit, flies away seeking food, then descends on its nest and lays an egg. Mother pippit, on returning, is surprised at its large size, but being proud of what seems to be her achievement, begins to hatch the egg.
>
> The young cuckoo [...] lays on its back and begins to push the legitimate pippit children out of the nest.[...] The mother will spend her entire energy to feed the parasite, completely unconscious of what is being loaded on her shoulders. She is the "kidnapped" sucker-parent by proxy, doing her duty because "it was there", the ...egg of Providence.[1176]

Remember, the Yetisyn are most generally idenfied with the Alpinids, who Caroll Quigley states split the original Mediterranoid people into a Nordic population, and who Madison Grant suggested were outpopulating the Nordic race, leading to its demise.

The Slavs have tended to stay behind in certain respects. The Slavic homelands, particularly Poland, were relatively free of feudal obligations. Rather than the land being administered by the royalty, as was done in later Germanic societies of the Iron Age, the Polish nobility acted instead as private landlords, having claim to the land by way of *allod*, a landly estate that the noble had, unless sold, claim to in perpetuity and without tax. This was associated with their Sarmation or Samaritan heritage, Eastern Europe having been called *Samarra* or *Sarmatia* in the past. Allodial land holders are considered to be sovereigns of their land whose rights are granted by God or by the Sun. Often throughout Europe, the norm was for only ecclesiastical and sometimes royal estates to be allodial. Germanic peoples had originally practiced this form of ownership, too, before adopting feudalism. Germanic allodiaries developed into the Germanic nobility, becoming subjected by territorial lords. In some places, allodial claims still exist and are even in effect. Poland continued the system of allodial title for quite some time. They were late to shift from allodial titles to the system of feudalism, and were also late to shift from agricultural society to industrial capitalism. It seems that the area is culturally conservationist.

Turkic peoples might be considered to play a similar role to the Slavs, but more East, being a highly mixed pastoral people. Turks readily admixed with other peoples who they dominated, including the Arabids and Turanids to their South, and Europeans to their West, establishing places such as Hungary,

[1175] A proto-Nordid or late Mediterranoid phenotype
[1176] Szukalski

a country in Europe named after the Huns. Turks made it as far into Europe as breeching Celtic and Romantic lands. However, the Turkic people are distinguished by their being more mixed with Mongoloids, Turanids, and Arabs than are Slavs, though they also have certain Mediterranoid, Alpinid, and Nordid admixtures as well. The Sakha of Yakutsk, for instance, happen to be very Nordid- and Turanid-like Turks, being related to the proto-Nordid Saka.

The Huns were the Westernmost presence of the Han people, as are found in China, perhaps a derivative of the Xiongnu, themselves being traced back, despite their apparent quarrels with the Yuezhi proper, and like the Chinese Han and other Chinese, to the Great Yu. Christopher Beckwith seems to deny the origins of the Huns from the Xiongnu (or "Hsiung-nu"), and does not seem to see them as a bridge between the Huns and the Hans of China, though acknowledges that historically the connection was made. Instead, Beckwith seems to want to consider the Xiongnu to be Saka on the basis of their name and the region they inhabited, which had in ancient times been an Iranic stronghold.[1177] While the Xiongnu may have had some Saka admixture, I tend to agree with the traditional conception of the Xiongnu as the Huns, and by extension that the Huns were Hans, or a branch thereof. Nonetheless, the rise of the Han or Qin Dynasty would correlate to the spread of the Xiongnu, with whom they were in conflict. Considering that the Qin, who would give their name to China, appear to have been placed geographically between the Xiongnu and the Han, and that the later Qing were Manchu-led, it may not be unreasonable to consider if the Qin were also Manchu-led, their presence causing the division between the Han and Xiongnu, or Huns.

Some of the Huns may have been only culturally Turkic, as with the White Huns, though this may also refer to the fair skin also found among many Turkic peoples, in distinction to Turks who may have relatively darker skin tones more associated with Tungusic-speaking people. As the Slavs spread throughout Central Europe, perhaps as a result of the expansion of the Turks, the Turks would begin to establish power centers, such as Khaganates, in Northwestern and Central Asia and down into the Middle East.

The *Tatars*, or *Tartars*, a Tat[1178] people, are a Turkic people living in Central Asia, representing a Scythian proto-Nordid and Turanid substrate and a slight Mongoloid superstrate from advances from Huns and Mongolians as well as some admixture with Tungusics around the Lake Baikal area and throughout Northern and Eastern Siberia and Manchuria. *Tartary*, the area of Tatar control, would spread, variously in time, across Central Asia and down South but uphill into Tibet as well as Northward and Eastward across much of Siberia and through to Manchuria and Korea. Examples of Tatar peoples besides the Tats or Tatars-proper include peoples such as the Kipchaks, Azerbailjanis, and Cumans. The Cossacks are a people inhabiting Ukraine who come from a mixture of Slavic and Tatar backgrounds.

Along the Volga River in what is now Russia, and out of the prior Turkic Khaganate, the Khazar Empire would develop. The Volga trade route is known for this reason as the *Khazarian Way*. The Khazars mediated Silk Road trade between China in the East and the Kievan Rus in the West. The Khazars were perhaps originally Tengrists or something similar, like the Huns and other Turkic peoples, and also like other Turkic people, were racially mixed, or *mongrelized*, a term derived from *Mongol*. They were primarily Aryans who had mixed with Turanids and Mongoloids. Being Tengrists made them open to taking the form of other religions, all non-Tengrist gods being seen as various faces of Tengri, and so Tengrist. Being surrounded by Christians to the West and Muslims to the South, having connections to

[1177] See Beckwith, 72
[1178] Jat

the Radhanites, and perhaps out of some nativistic sentiment or awareness of their own origins in the Yuezhi, the Khazars adopted Judaism for their religion, becoming the only Jewish Empire in known history. People such as Johann Ewers, Rabbi Isaac Baer Levinsohn, Nikolay Karamzin, Karl Neumann, and Ernest Renan have long tried to place the Ashkenzai Jewish homeland in Khazaria. However, there have also been arguments for the Anglo-Saxon origins of the Khazars. Of the Anglo-Saxons, for instance, in "Khazars," Valentyn Stetsyuk says, "let us say directly that the Khazar Khaganate was created and headed by them," but that "it should be assumed that the Anglo-Saxons were only the ruling elite of the Khaganate."[1179] Among others, it is popular to claim that the Khazars were sourced from Edomites, the progeny of the Biblical Esau, who had been forced to covert to Judaism by the Hasmonean dynasty of Jewish rulers, thereby being incorporated into the Jewish nation. The King of Khazars had claimed descent from Japheth. The Khazars, before adopting Judaism and likely afterwards, were a cannibalistic and sacrificial people who had worshipped Baal. Bradley says, "Once becoming Jewish and 'chosen,' these ex-Hun Khazars gave the word *slavery* to the world by selling Slavic captives in previously unimagined numbers." [1180]

Among the Khazars were the Abkhazians. Typically of a Georgian Caucasoid or proto-Iranic and -Germanic early Nordid phenotype, the Abkhazian people militarily and culturally occupy a zone of Georgian Caucasus. They are known for also having among them Congoid peoples, called *Abkhazian Negroes*, likely derived from West Africa, taken as slaves. Murat Yagan, an author of ancient teachings, is a famous Abkhazian established in Canada. He practices the "high mountain tradition" of the Abaza, or Abasgoi, tribe, called *Ahmsta Kebzeh*. *Kebzeh* is perhaps of relation of *Kebechet*, the Egyptian serpent water-goddess of embalming. Ahmsta Kebzeh is the ruling class tradition of the Abkhazis. It claims to manipulate or "develop" one's nervous system to become more spiritually-aware. It holds that diseases are owed to disruptions of the energy body owing to emotional, intellectual, or physical hang-ups. Yagan himself, as pictured on the back of his book, the second volume of *Ahmsta Kebzeh: The Science of Universal Awe,* in which he presents a profile photograph of himself (probably to demonstrate elite geneaology for those in the know), appears to have some characteristics of an Otamid phenotype, especially in nose-from and facial-flatness with a chin that juts out beyond the cheeks, red skin, and a slight brow ridge. He appears, however, exceptionally *hypsicranic*, or high-headed, a trait especially concentrated in the Caucasus and surrounding regions (such as in the Balkans and Anatolia) as well as among many Native Americans (including some of the Silvids, Margids, Centralids, Andids, Patagonids, and etc.), among Malaysians and other surrounding Asian populations, as well as some West Africans found South of the Sahara. Hypsicrania is not a trait commonly attributed to Otamids, who are typically understood to have low, sloping foreheads. However, and while Yagan is not an example of this, hypsicrania may accompany these Otamid features especially in South America, excepting for a low forehead, such as among some Lagids resulting from admixture such as between Fuegids and Patagonids. It's interesting that among the Fuegids are the Yaghan people, phonetically similar to the surname *Yagan*. Skulls in Peru—the *Paracas Skulls*— have shown exceptional elongation, often attributed to artificial manipulation, while Flathead Indians such as Walcolids were understood to have flattened their heads, likely in mimicry of the ruling class. Peoples such as the Yuezhi, Huns, Alans, and Goths had also practiced artificial elongation of the skull, mimicking or accentuating natural hypsicrania, as did the people inhabiting Samarkand in Central Asia, now inhabited by Turkicized, Alpinid Tajik people, and Samar in the Phillipines,[1181] among many others, such as the people of France

[1179] Stetsyuk[4]
[1180] Bradley[1]
[1181] Perhaps more flattening than elongation

in Tolouse who only relatively recently stopped it, and in Vanuatu who still practice it. Yagan's head appears to have been artificially elongated.

Curiously, F.H Fung has described possibly tridactyl (three fingers and toes, as with a three-toed sloth) and slope-headed, elongation-skulled Nazca mummies, without saggital sutures and with reduced occiputs. Two of these specimens are named *Montserrat* and *Maria*.[1182] Despite the large number of demonstrable fakes that abound, these have raised interest from serious extraterrestrial researchers and the curious public owing to their strange anatomy and physiology. They have also made their way into the parliamentary deliberations of Mexico and Peru. Skeptics, such as Daniel Proctor and others, however, think these are manipulated corpses that have had body parts rearranged and removed. If real and not manipulated, or meat dolls like some of the demonstrable false ones, I think this a better working hypothesis than extraterrestrials is polygenesis, perhaps from a sloth-like creature, owing to the fewer number of outrageous and ungrounded assumptions that must be made to assume the latter. They could, of course, be entirely bogus. The same could be said of Brian Foerster's claims regarding the anatomical differences and genetics of the various elongated skulls he claims to have had genetically tested (unrelated to these tridactlys), which he seems to believe showcases major phyletic differences between these people and other humans.

The elongated heads may have been natively evolved in South America or perhaps even in the Caucasus or, wildly, Antarctica, its original holders perhaps having excelled in some degree of intelligence over others and becoming a priestly or politicial elite. However, through much intermixture, and over much time, this natural characteristic would develop into basic hypsicrania of today, and had to be maintained by head-binding. Others might begin to copy, and eventually pass for elites themselves. Over time, what might had begun as a racial characteristic may have become a stamp of affiliation with the characteristics long-gone of a once influential race of humans. The opposite could also be true, however. Hippocrates says, for instance, probably speaking of Scythian groups,

> Macrocephali. There is no other race of men which have heads in the least resembling theirs. At first, usage was the principal cause of the length of their head, but now nature cooperates with usage. They think those the most noble who have the longest heads. It is thus with regard to the usage: immediately after the child is born, and while its head is still tender, they fashion it with their hands, and constrain it to assume a lengthened shape by applying bandages and other suitable contrivances whereby the spherical form of the head is destroyed, and it is made to increase in length. Thus, at first, usage operated, so that this constitution was the result of force: but, in the course of time, it was formed naturally; so that usage had nothing to do with it; for the semen comes from all parts of the body, sound from the sound parts, and unhealthy from the unhealthy parts. If, then, children with bald heads are born to parents with bald heads; and children with blue eves to parents who have blue eyes; and if the children of parents having distorted eyes squint also for the most part; and if the same may be said of other forms of the body, what is to prevent it from happening that a child with a long head should be produced by a parent having a long head? But now these things do not happen as they did formerly, for the custom no longer prevails owing to their intercourse with other men.

Hippocrates' statement would seem to suggest a form of conscious evolution. If true, elongated heads have their origin in artificial cranial manipulation and then natural traits corresponding to this cultural standard would be favorably selected, familialy, sexually, and socially. Of course, Hippocrates was not

[1182] See Fung

around long enough to know, though he may have been informed by cultures that retained memories of the practice through their traditions. He could be completely mistaken.

The Jews of Khazaria are a possible source of the Ashkenazi or Yiddish-speaking Jews of Europe, although this is probably not at all exclusive, as relatives of the Gutes and Jutes had natively populated Ashkenaz for quite some time, having interacted with the Radhanite Jews of the Middle East in a similar manner to the interactions between the Norse and the Slavs. The fact of the matter is that the Jat Belt and surrounding areas has long been a dynamic zone of admixture, whereby a spectrum is created from Northwest to Southeast, uniting peoples as far as Scandinavia and the Indies. That there was a longstanding connection between Jutes and Radhanites, and between the Norse and the Slavs, giving way to peoples such as the Ashkenzi Jews and the Rus should not at all be surprising. The particularly foreign aspects of Ashkenzi Jewry are derived from Babylonian captivity, which would influence Radhanite and, by extension, Ashkenazi Jews, distinguishing them from their more purely Indo-European Jutish cousins. Yiddish seems to have developed as a synthesis of Germanic, Hebrew, and Turkic sources.[1183] As Beckwith tells us,

> [T]he Vikings had become intensely involved in commerce with the Islamic lands of the Near East via the Russian rivers. This trade route had first been developed by the Khazars, Jews, and Muslims and only then came under the domination of the Vikings [...] Sailing West on the Black Sea, the Rus reached the Byzantine [...] [who] hired them as mercenaries, thus constituting the famous Varangian Guard.[1184]

The Varangians, originally composed of Rus efforts, and supported by the Byzantine Empire and the Papal States (including Venetians) as bulwarks against the East, eventually, after the Norman conquests, included Angles and Saxons into the Varangian Guard as well, similar to their role later as Transylvanian Saxons, such as those impaled by Vlad the Impaler (Dracula). The Rus and the Khazars, both connected to the Radhanites, were at odds with one another. Ultimately, the Khazars were wiped out by the Kievan Rus, except for the royalty and nobility, which went through Hungary, Poland, Germany, France, and Spain, leaving people behind along the way, calling themselves *Ashkenazi Jews*. *Ashkenaz* either means Anatolia or Germany. Some suggest that Togarma, son of Gomer, name-stole Ashkenaz's moniker, another son of Gomer. He then apparently started conflicts with real Jews and Samaritans, their opponents along with Russia. The infamous Rothschilds, often considered the villains of world society, were possibly Khazars of this lineage. Rothschilds, it is suggested, named Germany *Ashkenaz* after their homeland. The Venetians had seen the Radhanites as strong competition for trade in Europe. After the fall of the Khazar Empire and the cutting off of Radhanite trade into Europe, Europeans, particularly the rich who had become accustomed to their use, suffered a period without Eastern spices while Venetian influence grew, though Albanian pirates disrupted Venetian traders.

In a certain respect, the spread of the Radhanites, in the form of the Norse and the Rus from out of the Jutes, as well as of the Slavs and Turks advancing Westward, and their conquering of the proto-Germanic and Iranic proto-Nordids and Pontids and the Anglo-Saxons Nordids, is similar to the spread of the Scythians or the Yamnaya over their predecessors, representing a later wave of conquerors in Europe, the establishment of a new superstrate. However, this superstrate also includes the old nobility through intermarrying and cultural assimilation, typically as arranged by war chieftains' compromising with external threats against the demands of civil chieftains and the rest of their own ethnic group.

[1183] Similarly, there are Judeo-Iranic and Judeo-Spanish languages
[1184] Beckwith, 166

Mystery Cults and Perfection

The mythological and philosophical schools of mystery would make a major impact on society, bringing us what would become civilization, and then, with a change of hands, heresy and radicalism (and free thought and explicit Mutualism more specifically). Early Mutualistic traditions were found in pagan mystery cults and schools of philosophy, elements of which would go on to influence the fraternal practices of later secret societies, guilds, *societas*,[1185] *collegia*, sodalities, cooperatives, labor unions, and other institutions close to the heart of Mutualism. These institutions are often traced through to the Greek and Roman schools of philosophy and the mystery schools more widely, and often involved burial ceremonies. The philosophical schools of Greece, Rome, and other societies maintained themselves as perennial interests to free thinkers, such as those of the Mutualist *milieu*.

Mystery traditions in later Greco-Roman society— points out Marcus Terentius Varro— were something separate from state religions and philosophical outlooks, which they often coincided with, or ran parallel to. Perhaps most significantly, they were often open across class lines and had an egalitarian nature to them that was not common to everyday life. They were secret and exclusive to initiates of the mystery in question. The mystery cults and philosophy together provided alternatives to the official state religion. But the state religion had also grown from them, as essentially all ancient religions had, whether immediately or directly, or as haunted by pasts long gone. The mysteries represent the Petri dish from which state religions and states themselves had come to evolve. Manly P. Hall, too, the famed 33rd degree Freemason and philosopher, puts emphasis on the importance of mystery schools, when he tells us in *The Secret Teachings of All Ages* that "the pagan Mysteries were the architects of civilization," but that "they eventually fell a victim to the onslaughts of that recurrent trio of state, church, and mob." He says that they had been "desecrated by the state, jealous of their wealth and power; by the early church, fearful of their wisdom; and by the rabble and soldiery incited by both state and church."[1186] John Yarker says, citing Jacolliot, that "the Artisan caste [had] formed two divisions the one of which adopted as its mark or sign the plumb-rule, and the other the level," common symbols in Freemasonry, and that they

> eventually united into one in order the more effectually to resist the confederacy between the two higher castes; and all the great works of remote ages was executed by this confederacy. As this confederacy is evidently a mixed caste, and as the two higher castes [...] refused them recognition, it seems evident [...] that these builders were a mixture of Aryans and aborigines, who had their existence as a Fraternity before caste existed, and from the evidence adduced [...] and the splendour of their labor, a branch of the Cabiric fraternity.[1187, 1188]

The mysteries are the soil from which church and state spring forth, but they themselves are neither state nor religion in the proper sense of things, perhaps being closer to proto-state "civil society." As such, every church and every state has revered the mysteries, openly or, often, in a clandestine fashion, and has declared a monopoly upon their taxonomy and paradoxes. But Nature, Mystery Herself, has remained such that neither priest nor politician can make of themselves absolutely necessary intermediaries, at least not to those who figure out for themselves that Nature, including her *telos*, is God, and that each and every person, as a direct expression of "Him," is necessarily a direct line to God themselves. Thus, the mysteries are associated with the *perennial philosophy* and the *prisca theologia*,

[1185] The Roman term for a partnership
[1186] Hall[2], LXXX
[1187] Yarker, 66
[1188] Who is a mixture of aborigines and Aryans, if not the Jats?

or original religion, as often discussed in the halls of Freemasonry. Nonetheless, traditions can be useful, even if they threaten to become dogmas. And the mystery tradition represents such a tradition. Manly P. Hall says that

> The Mysteries taught that spiritual illumination was attained only by bringing the lower nature up to a certain standard of efficiency and purity. The Mysteries were therefore established for the purpose of unfolding the nature of man according to certain fixed rules which, when faithfully followed, elevated the human consciousness to a point where it was capable of cognizing its own constitution and the true purpose of existence. This knowledge of how man's manifold constitution could be most quickly and most completely regenerated to the point of spiritual illumination constituted the secret, or esoteric, doctrine of antiquity.[1189]

He says, "[t]he Mysteries were institutions erected for the transmutation of base ignorance into precious illumination."[1190]

Some trace mystery traditions through Thracian-trouser wearing philosopher, Pythagoras of Ionia, or Thracian religious figures such as Orpheus. The Orphic mysteries held to a conception now called the *Orphic egg*, which pictures a sort of cosmic egg wrapped by Ananke (Necessity), from which a hermaphroditic diety, sometimes associated with Pan, is hatched. Ananke was the first god in existence. The Greeks established their early philosophies upon the notion of the necessity of existence, and in Orphic tradition, Ananke was a Greek serpentine goddess of necessity, inevitability, and compulsion that spanned across the cosmos, was mate of Chronos (also serpentine, not Cronos), and crushed the egg of creation, splitting it into Earth, Heaven, and Sea. Some myths suggest that she is the mother to the Fates, or Moirai, who spin the threads of fate and destiny. Gods such as Ananke were beyond the reach of younger gods, whose fates they controlled. Ananke is often depicted with wings and a liberty cap and holding a spindle. Interestingly, however, Plato posed *intellect* against *ananke*, suggesting that intellect overcame ananke (necessity), resulting in creation. Of the Orphic mysteries, Thomas Taylor said that

> In conformity with modern prejudices, the author of the *Letters on Mythology*, endeavours to prove, that the Orphic hymns deify the various parts of nature, not considered as animated by different intelligences but as various modifications of inert and lifeless matter. This hypothesis is no doubt readily embraced by the present philosophers, a great part of whom deny the existence of any thing incorporeal; and the better sort, who acknowledge one supreme immaterial Being, exclude the agency of subordinate intelligences in the government of the world, though this doctrine is perfectly philosophical, and at the same time consistent with revelation. The belief indeed of the man; who looks no higher than sense, must be necessarily terminated by appearances. Such a one introduces a dreadful chasm in the universe; and diffuses the deity through the world like an extended substance; divided with every particle of matter, and changed into the infinite varieties of sensible forms. But with the ancient philosopher, the deity is an immense and perpetually exuberant fountain; whose streams originally filled and continually replenished the world with life. Hence the universe contains in its ample bosom all general natures; divinities visible and invisible; the illustrious race of dæmons; the noble army of exalted souls; and men rendered happy by wisdom and virtue. According to this theology, the power of universal soul does not alone diffuse itself to the sea, and become bounded by its circumfluent waters, while the wide expanse of air and æther, is destitute of life and soul; but the celestial spaces are filled with souls, supplying life to the stars, and

[1189] Hall², LXXVI
[1190] Hall², XCII

> directing their revolutions in everlasting order. So that the celestial orbs in imitation of intellect, which seeks after nothing external, are wisely agitated in perpetual circuit round the central sun. While some things participate of being atone, others of life, and others are endued with sentient powers; some possess the still higher faculty of reason; and lastly others, are all life and intelligence.
>
> [...]
>
> Not only the universe, but each of its eternal parts is animated, and endued with intellect, and is in its capacity similar to the universe. For each of these parts, is a universe if compared with the multitude it contains, and to which it is allied. There is, therefore, according to the Orphic and Platonic theology, one soul of the universe; and after this others, which from participating this general soul, dispose the entire parts of the universe into order; and one intellect which is participated by souls, and one supreme God, who comprehends the world in his infinite nature, and a multitude of other divinities, who distribute intellectual essences, together with their dependent souls, and all the parts of the world, and who are the perpetual sources of its order, union, and content. For it is not reasonable to suppose that every production of nature, should have the power of generating its similar, but that the universe and primary essences should not more abundantly possess an ability of such like procreation; since sterility can only belong to the most abject, and not to the most excellent natures.
>
> In consequence of this reasoning, Orpheus filled all things with Gods

"Mystery religions," says Michael Cheilik, were "present in Roman life since the early Republic." He says that "the populace craved immortality and a deeper feeling of belonging to the universal order," but that the "icy state cult, with its legalistic formulas and its shadowy afterlife, did not fill this need, nor did most of the philosophies inherited from Hellenic culture." So, he says, "adherents of the older mystery cults, the new mystery philosophy, and Christianity multiplied even more. Astrology became a vital force."[1191] Esoteric traditions such as Sufism, Kabbalah, and Gnosticism represent more recent renditions of the mysteries, and are often seen as counterparts to the more exoteric Babylonian Judaism, Christianity, and Islam. Pagan religion and mythology still accompanied the Greeks' and Romans' interest in philosophy, until, in later antiquity, Christianity would spread throughout Europe. The Orphics had another myth about the resurrection of their god Dionysus, which has led to comparisons to Mithra or Jesus.

The *Gnostics*, or "learned," likely having much relation to the philosophers, and coming largely from out of people such as the Samaritans and Celts, among others, venerated Sophia, but believed her to be fragmented into the individual souls of the population, waiting to be liberated through *gnosis*, or spiritual knowledge. *Gnostic* likely comes from or shares a relationship to *Nastika*, the set of heterodox traditions coming out of Vedic or Hindu tradition, including Buddhism and Jain beliefs, as well as the Caravaka tradition of atheistic materialism. Orthodox Vedic belief in India is known as *Astika*. *Astika* has been compared to *theologoi*, while *Nastika* has been compared to *physiologoi*, perhaps imperfectly so. Nonetheless, the relationship between natural philosophy and Gnosticism is hard to miss.

Many emanationists, such as the Gnostics— inspired by teachings of surrounding neo-Platonists as well as by native pagan beliefs—, found a strong resolution for the problem of evil. As Plotinus had taught that everything comes from a single Source, and further proximity from the Source is distance also from the Good, the True, and the Beautiful, a sort of depravity, the Gnostics taught that distance from God,

[1191] Cheilik, 224

the One, was also distance from Perfection. In some interpretations of the Gnostic mythos, the implication seems to be that perfection is a matter of completeness: To be a portion, a fraction, of the Whole, is to lose sight of, and to cease participation in, this completeness. Good and bad, then, becomes a false perception; what is good to one is bad to another, and vice versa. Both are incomplete. Perfection exists beyond, and contains, this duality.

The Gnostics suggested that the existence of evil—which was simply a good misunderstood, or incomplete— is inherent to the material world, a construct of the Demiurge. The world of spirit, as it were, contains the existing good in the world. The problem is that portions of spirit (or Sophia) are trapped by the Demiurge in the fractioned bits of matter— the body—, struggling to be freed. Often, Sophia does not recognize herself in others, due to the fractured parts she is stuck within, which causes conflicting perspectives. The human spirit (which is good), Sophia, sees itself in the material conditions set into place by the Demiurge, and loses sight of its own value, seeing fractured portions of itself—though a portion of Perfect—as bad. Each portion of Sophia finds itself in the same conflict, seeing other portions of itself in competition for resources; a carryover effect of separation and materialism. This is why matter is associated with relativity, and thus conflicting desires and perspectives on good and bad. The Gnostics associate matter with the origins of evil. Everyone, amidst conflict, sees their own will as good, and that of others as bad.[1192] Conflict is a matter of scarcity, a condition of material existence. If left purely to spirit, mind over matter, abundance would be the rule, and conflict would cease to be. Everything would be understood to be good. Spirit and matter, as it were—one good, and the other bad, in a sense—, compose the perfect Whole. Spirit is the origin of good, and matter is the origin of bad. Because all beings are composed of spirit and matter, and we only experience our own spirit, all beings see themselves as good, and others as bad. That is, they experience their spirit, and others' bodies; they experience the good (satisfaction of spirit) from within, and the bad (limitation of spirit) from without. They are ignorant of perfection. Its acknowledgement is *gnosis*, the goal of the Gnostic.

Taking after the neo-Platonists, the Demiurge in many traditions is not meant to be understood as fully evil, but is merely incapable of Perfection. In some ways, the Demiurge may be understood to be limited from a perfect rendition of Platonic form—the Good, the True, the Beautiful— in the same way that a

[1192] Two people, neither of whom know the other, enter a busy coffee house, book in hand, ready to take a seat and read for a few hours. There is one seat open. The first one in sees the seat, but assuming the first in line will also be the first to sit, she moves forward to the line. The second person, knowing if they stand in line they will lose the seat, anxiously skips the line to set their book in its location, preserving it for post-acquisition of their drink. They then stand behind the first. The first person is understandably annoyed; they wanted the seat, but didn't think of the necessity of saving it, possibly even having a preconceived notion of fairness which has been infringed upon. The second is happy to have thought ahead; they get exactly what they came for. Fairness may come into dispute, but even if the second customer stood in line, one of the customers (themselves) would have lost out on a place to sit, and felt the situation to be a bad one. What we have come to is a matter of dispute, and the origins of this dispute have to do with the playing out of preferences. Even if the employees of the coffee house step in, and say that the second customer was acting unfairly, this is not so much a matter of fact, but a preference for behavior on behalf of the employees (and one which may previously not have existed at all). This preference, which the first customer and the employees would agree is good, would be understood to be bad to the second customer. After all, there was no sign posted regulating the order in which one orders drinks and claims a seat. As far as they are concerned, such a dictate is unfair, and lacks in even-handedness. Surely, they think, they cannot be the first to have chosen a seat before ordering a drink (they may have, in fact, found themselves in the position of the first customer in a prior scenario, having lost out on a seat in the past in the same way, feeling such an act then to be "fair game"). The dispute, claims of good and bad, stems from the reality of the situation, not the ideality of it. That is, the customers would probably agree that the ideal situation is for everyone to have a seat and to feel satisfied; the conditions of reality are such that these ideals are unfeasible, and so material existence leads to conflict. In this way, good and bad are both relative and absolute. Unity is absolutely good, and separation is absolutely bad; but within the separation are notions of good and bad. The existence of good and bad is absolutely perfect. Such is the fractal Universe in which we exist.

painter is limited from capturing a perfect image of a brook on his or her canvass; a striking, yet futile, attempt. That which is intrinsic can never be duplicated from outside.

Regardless of what one makes of Sophia and the Demiurge, the Gnostics touch on something rationally important: Perfection is a trait of the Whole, and good and bad are matters of fraction. The Whole contains both good and bad, but this is perfect in that they complement and define one another. The more we stray from an understanding of the Whole, the more we get caught up in our own subjectivity, which entails conflicts of perspective. The best approximation of Perfection can be found by way of wisdom and compassion. In compassion one sets aside one's iron will, and takes one up more malleable, in order that the will of others may be accommodated, along with one's own. In many ways, the resolution to the problem of good and evil, of conflicting goods, is a matter of working for the good of the Whole, working toward the balance of interests. The Greatest Good, if one may take from Aristotle, is a matter of consensus; a good that none other sees as bad. Even still, the Greatest Good is merely a portion of Perfection. The Greatest Good requires the greatest bad for recognition. Without contrast, good and bad don't exist at all. The contrast, itself, which allows for experience, is perfect. The Greatest Good is the temporary recognition of Perfection, but Perfection always is. The Universe is Eternally Perfect.

Everything is perfect within itself. No one else can fit the perfect description of you. You are unique, and uniqueness is perfection. As an individual, in every moment in time within that moment, you are perfectly you. It is in comparison to others, when one is regarded not as an individual unto themselves, but a member of a species, that this perfection is lost sight of. You are perfectly you, but you are not perfectly human. No one is. When the fractured portions are set into contrast amongst one another, their deficiencies and imbalances are made apparent.

Unlike fractured portions of the Whole, the Monad contains everything within itself. Nothing exists outside of its bounds. It is, in fact, the thing in itself. There is nothing outside of it to challenge its Perfection, nothing with which to contrast it. It is a fraction of nothing, and the totality of everything. All notions of good and bad exist within its Perfection. The Universe is Perfect.[1193]

Gnosticism ranges from Hermeticism and Sethianism to Valentinianism, Marcionism, Manichaeism, Mandaeanism, and more, and overlaps with Kabbalah and Sufism. Not all Gnostics would agree with my assessment above, because Gnosticism is more of a *milieu* than a dogma, and comes in many flavors. Gnostic theosophy included elements of pantheism, dualism and monism, emanationism, and metaphorical, allegorical, or astrotheological entities such as the Demiurge, Aeons, Archons, and more. Gnosticism would later express itself in medieval mysticism and in magico-religious beliefs, as found in people such as Symeon, Gregory Palamas, Meister Eckhart, Hildegard, Saint Bernard, the Victorines of Peter Abelgard, Dominic de Guzman, Francis of Assisi, the Beguines, the Rhineland mystics, John on the Cross, and etc. It was certainly an influence on heresies such as the Bogomils, Waldensians, Cathars, Free Spirit, and others as well.

[1193] "I just don't like it," one might retort. "How can something I don't like be perfect?" Like pain, it is necessary. Is pain good or bad? On the surface, if we answer purely emotionally and subjectively, pain is clearly bad! Everyone knows pain is to be avoided. Objectively, however, we can see that pain performs an important service to the body. We do not feel pain until our barriers have been broken. This can be by way of forceful tearing or puncturing, by burn, bruising, or another invasion of one's physical perimeter. If we are feeling pain, we know to get away from the source of the pain, the thing that is causing us physical harm. A burn tells us that we are too close to a fire or a hot surface. As we feel the sharp edge of a metal surface we are cleaning slice into our palm, we know to discontinue the pursuit, so as not to encourage unnecessary entropy. Pain is subjectively bad and objectively good; a relationship of higher perfection. Can you think of an act that is subjectively good and objectively bad? If you were to pursue such an act, would you last long? This is why it is rare to find such things.

Hermeticism, coming especially from Egypt but largely by way of Greece as a Greco-Egyptian religion, would become especially important as a basis of gnosticism. Hermeticists, following a leader named *Hermes*, considered also to be Thoth or Mercury, were associated with natural magical arts, such as astrology and alchemy, among other things, combined with ritualistic magic or *theurgy*. It held to a pantheist worldview, wherein God is *The All*, the whole of existence or The One, and that the *macrocosm*, or the larger scale of existence, directly correlates with the *microcosm*, or small scale. They hold to reincarnation, like many Gnostics. A similar belief, neo-Platonism, likewise holds to an emanationist cosmology that takes place within The One, and similarly holds the One to be essentially *nous* or mind. Mary the Jewess was a very early, and perhaps the first, known alchemist in history, being of the Hermetic tradition. She had taught the concept of the *unity of opposites*, of male and female forces to create something new. She had said, in a magical-dialectical fashion, that "One becomes two, two becomes three, and out of the third comes the one as the fourth," known as *Maria's Axiom*. Carl Jung had apparently considered this in his psychology to have been a statement about individuation and integration. Another statement attributed to her is, "Join the male and the female, and you will find what is sought." She is also known through a number of inventions. Cleopatra the Alchemist was later associated with the school of Mary the Jewess. She said of the Ouroboros that, "One is the Serpent which has its poison according to two compositions, and One is All and through it is All, and by it is All, and if you have not All, All is Nothing."

Mandeans, remnants of the Sabians, were a Gnostic sect who worshipped a deity called *Hayyi Rabbi*, meaning "The Great Living," represented by life-giving water, or *yardna*, river water appropriate for baptism, necessitating life by the river.

Marcion had been a Gnostic preacher, perhaps the first to compile a New Testament, who had believed that the god of the Old Testament had been a separate diety from the God of Christ. This distinguished Christianity from Judaism. The god of the Jews was an actually-existing, though lesser diety to God, and Jesus was sent to free humanity from the Jewish god, who was the Demiurge.

Valentinus was as Gnostic preacher who was nearly made Pope. According to Pat Pryor, in "Gnostics: Valentinians and why orthodox believers feared them," says that Valentinians, the followers of Valentinus, worshipped a god that was called the Deep. Valentinians, she says, believed that matter, which was manifested in pagans and Jews, at the end of time was destined to perish, and was the lowest form of existence. Everlasting spirit, residing in the Valentinians, was the highest realm. Soul, the realm of humanity, especially non-Valentinian Christians, was extended between the two, in a sort of becoming. Perhaps, suggests Pryor, the Valentinians believed that these forms of existence resided in each individual, and that each person has the option to be eternal, to perish, or to remain becoming as a matter of their free will. Valentinians, she says, speak of the realm of God as a sort of fullness. Pat holds that Valentinians believed that Wisdom, a craftsman, had made a mistake in desiring to know God directly, being cast from the fullness and leading to the emanation of Earth. Pryor says that, according to the Gnostics, "Wisdom and Forethought worked together to enlighten human beings to recover this divinity that had been stolen," but that Valentinus, instead, suggests that there is a direct connection between humans and God and that Logos, which reveals God to us, took the form of Christ, who upon his crucifixion upon a tree became the fruit of knowledge. Sin, according to Valentinus, was ignorance, especially of God, resulting in the material world.[1194]

[1194] See Pryor

Often understood to be the quintessential Gnostic sect, and perhaps derived from or progenitor of the Mandaeans,[1195] the Sethians were derived from the same people as the Scythians, though they tended to originate in Egypt.[1196] They had gotten their name from the Egyptian god Set, the Greek Seth, who is also Seth from *The Bible*, third son to Adam and Eve, which some of the Sethians had apparently believed to have been the pure son, unbegotten by the Demiurge. Set, in Egyptian cosmology, is the son of the Earth (Geb) and Sky (Nut), and he also represented the West side of the Nile River. He was commonly understood to represent the planet Mercury, not unlike Hermes Trismegistus, and is sometimes equated with the serpent god Typhon. He was a shapeshifter depicted in many forms, a Trickster god. Eventually, Set would come to represent the gods of foreigners, no matter who.

While many scholars hold that the Sethians saw themselves as the "seed of Seth," other scholars have argued otherwise. David Litwa, for instance, in Miguel Conner's "The Evil Creator and the Sethians," holds that the Sethians understood Seth to have been an evil creator, the Demiurge, and that the Egyptians held that the Hebrew God Yahweh was Seth, who they depicted as a "donkey-headed god," Yahweh sounding to them like the hee-hah of a donkey, *yao* actually meaning "donkey" in Egyptian.[1197] To the Egyptians, suggests Litwa, Yahweh had been the God who had wreaked havoc on Egypt, senselessly killing firstborn sons, causing plagues, and etc. The Egyptian Gnostics, the Sethians, as a result, understood the Jewish God, Yahweh, to be Seth, the evil god.[1198] This, however, runs counter to the suggestion that the Sethians adopted their name in favor of Seth, unless it represented some kind of internal Scythian rebellion against the past and their own heritage. Litwa says that Sethians were Christians, but that they were framing Christianity within the context of a negative-Demiurge theology. This was distinct, for instance, from the neo-Platonic conceptions that tended to view the Demiurge in a positive light.

The Sethians were transcendental trinitarians who practiced sex magic and used entheogens to induce altered states of mind, believing also in out-of-body experiences or astroprojection. The Sethians were often equated with the Ophites, who had held that the snake and Jesus were the same, and that Eve had thereby listened to Jesus, the trinitarian Son. The "Secret Book of John," a Sethian Gnostic text, says that Jesus caused Adam to eat the fruit, but contradicts this just after by saying that the serpent did it to cause wickedness needed to control Adam. Clearly there are many mixed opinions regarding the Sethians, resulting from both friendly and unfriendly perspectives of them as well as differing interpretations in general. Many scholars suggest that the Sethians equated Christ to Seth, too. Perhaps there were disagreements between Sethians themselves. Whatever the case, they venerated the snake as a heroic figure who had tried to save humanity from its oppression. One of the Sethian rituals is telling of Egyptian-styled teleology. According to Miguel Conner, citing April DeConick, in the "Secret Book of John," an initiate in a ritual, understood to be in Hades (Hell), is called out from the darkness by

---

[1195] Mandaeans were possibly Samaritans and Druze from Samaria and Galilee

[1196] The Scythians, or at least some among them, in particular the lineage of the Pharaoh Joseph, may have understood themselves to have come from Egypt. Some may even have understood their time in Egypt to have been even more ancient, perhaps being aware of their Nesiotid roots or those of Levantoids in the land of Cush (or Kush) where Set was worshipped. The Scythians, or Sethians, would also be visitors of the Hindu Kush Mountains, named after the Kush of Egypt who had fought up into Western and toward Southern Asia, perhaps being something of a pilgrimage as well as a matter involving Silk Road trade embargos. Indeed, the Indo-Nordid phenotype, a derivative of the proto-Nordid and the Easternmost variety of Nordid, is a locally-adapted race to the area of the Hindu Kush, a reminder of the early presence of proto-Nordids in the area. The Sethians were likely of Anglo-Saxon stock.

[1197] Cornelius Labeo, a Roman scholar, wrote about the deity Iao (Yow), and how the other gods are aspects of this one god. *Theocrasy* is the mixing of deities into one.

[1198] See Conner[2]

Forethought, or Sophia, who saves the initiate from their conditions of slavery and baptizes them in water, reminding them that they have heard the truth and must guard themselves from falsity.[1199, 1200]

Mani was a Parthian prophet, whose followers are called *Manicheans*. Manicheanism is a continuation of older Mazdaism as it had developed from out of the Yamnayan offshoots, and of Zoroastrianism. Like these other religions, Manicheanism is dualistic. Mani poses that there is a world of Light and world of Darkness that are engaged in an almost permanent cosmic battle, a battle that will ultimately come to favor the Light. This is essentially a teaching of salvation. Like other Gnostic religions, of which Manicheanism is one, Mani posed that the human had a divine light—in many Gnostic traditions, Sophia, or Wisdom— in them that was entrapped in the world of darkness. Mani, perhaps a Marcionite—a follower of the Gnostic Christian Marcion of Sinope— or influenced by Marcion, had considered himself a follower of Jesus Christ, but he ultimately saw himself in a long line of prophets going from Buddha to Zoroaster, Hermes Trismegistus, Plato, and Jesus. Like many of the other heretics in history, including Jesus, Mani would be tortured to death. Like Manicheanism, from which it may have taken influence, and contemporary with it, Mazdakism was derived from Zoroastrianism. It notably promoted communism and *polyfidelity*, or group marriage.

Remnants of the religious leaders of the Celts, called *Druids*, are likely to be found among the *Druze* people, white, Pythagorean (Pythagoras is often associated with Druidry), Alpinized Aryans found in the Middle East, such as in Israel, sometimes classified among the Nordids. The Druze were Kenites, or, according to Wilhelm Gesenius, Cainites. *The Bible* says that the Kenites settled with the Tribe of Judah. They may have been responsible for the adoption by Abraham of the god Yahweh, suggests Friedrich Wilhelm Ghillany. The Druze occupy Mount Hermon in Northern Canaan, the source from which the Jordan River flows, in which Jesus was said to have been baptized. Mount Hermon is considered a cursed mountain by Jews, where the Nephilim were said to have been generated from the intermixture of humans and fallen angels. Therefrom the Tribe of Dan had apparently come, and there the god Pan was worshipped. Israel Knohl says that this was the true Mount Sinai from *The Bible*. The Druze may also be from the religious sect that the historical Jesus belonged to, as suggested by DNA testing of the Shroud of Turin, fabric that is said to have been used to wrap Jesus's face, which contains the image of a face and tested positive for Druze genetics. Jesus's parents, Joseph and Mary, lived in Galilee, a town called *Nazareth*, likely named after Celtic peoples— "Gauls"— such as those in Galatia. Of the Druze, John Yarker says they are "Syrian Mountaineers," "a peculiar race who are probably of Phoenician descent." He says, "[t]he members are sworn to absolute secrecy, and strictly observe their oath. They are known to have signs of recognition which are common to Freemasonry."[1201] The Druze themselves trace their ancestry to Jethro, father in-law of Moses.

Abrahamic Religions

The Abrahamic faiths, having grown from the mystery schools, maintain that an oral history had eventually been gathered and written down of a people called the *Hebrews*, who had kept a longstanding covenant with their god who had promised them land of their own. Likely having come from the Hyksos, Hapiru, and Shasu raiders and hired mercenaries, they had developed from a herding people, who had raised goats and sheep. The original Abrahamic religion was an early monotheistic religion probably inspired by or deviated from Sumerian religion, Atenism, Zoroastrianism, or Vedic

[1199] See Conner[2]
[1200] Sethians would be subsumed into other more popular camps, such as the neo-Platonists and later Gnostic groups such as the Bogomils and Cathars, perhaps also contributing to the Knights Templar and other elite orders.
[1201] Yarker, 158

religion such as Hinduism.[1202] While not the first monotheist religion, it was the first of the existing Abrahamic religions (which includes Christianity and Islam). It is notable in the West for its lengthy chronology and ethnic ideology, which is grounded largely historically. The Hebrews had found themselves subduing other nations. But they were subdued by other nations as well, such as the Assyrians, Babylonians, and then the Romans. It has since been divided into separate camps, among them the Samaritans, Jews, Druze, Christians, and Muslims.

Samaritanism, the religion of the Ancient Israelites (North Israel is also called *Samaria*) as distinguished from that of the Jews, is an Abrahamic religion that is very much like Judaism. Of relation also to the Samara, Samarra, Sumerians, Shasu, and Saka, the Samaritans are typically traced back to Palestinians who, after the onslaught against the Kingdom of Israel and its evacuation by the larger population, had mixed with surrounding Canaanites and repopulated the "Holy Land." Ephraim and Manessah are counted among contributors to the Samaritans. According to the Samaritans, the holy mountain upon which the most important events of the religion occurred, where Noah landed his ark, Abraham was prepared to sacrifice Isaac, the Israelites first performed their ceremonies upon entering into Canaan as told to do by Moses, and which had been chosen by Yahweh for the Israelites to center their lives upon, was Mount Gerizim, which interestingly enough also has a recognized meridian line running through it. While Israelite blessings were performed on Mount Gerizim, on Mount Ebal curses would be given. The Israelites (Samaritans and Jews) were divided on these mountains. However, after the Samaritans and the Jews had been scattered into Scythia and Babylonia, and after their reconvergence, the Samaritans would continue to worship on Mount Gerizim, while the Jews would establish their center of worship in Jerusalem. Samaritans and Jews would fight violently over their disagreements about the holiest of places, as well as against the Roman Empire. Jews denied the importance of Mount Gerizim, holding instead that Noah had landed on Mount Ararat and that Isaac had almost been sacrificed on Mount Moriah.

The Jews had more relation to the Yuezhi, the Gutes, and the Goths than to the Shasu or the Saka. Nonetheless, Rabbinical Judaism, the beliefs of the Jews who had been captured and taken to Babylon, the people of Southern Israel, was very much like those of the Samaritans, excepting especially issues surrounding the mountain and Rabbinical beliefs that the Babylonian Jews had but did not share with the Karaite Jews, a sect of conservative Jews. After a kind of Renaissance of the mystery schools, Judaism had been updated following the rise of the Radhanite rabbis and the codification of apparently longstanding secret oral traditions,[1203] compiled variously into *The Torah*, part of a larger *Tanakh*, and *The Talmud*. Karaites do not organize rabbinically, however, and, like Samaritans who only recognize their own version called the *Pentateuch*, only recognize *The Torah*. Their approach to interpretation is similar to that of later *Anabaptist* Christians— believers in voluntary baptism over infant baptism—, in that they prefer a plain or obvious reading of scripture. Rabbinical Judaism is not the same, however, relying instead on legal proceedings of the Sanhedrin, or Jewish elders. Rabbinical Judaism was Pharisaic, and inspired by Hillel, a Radhanite, whereas Karaite Judaism may have been an offshoot of Saducees, perhaps following Shammai.[1204] Like Jesus Christ, whom he would inspire, Hillel's teachings

[1202] Judaism began as a monolatristic or henotheistic religion that synthesized different Canaanite Gods and otherwise refused to worship an outside god, though they acknowledged the existence of other gods early on. That they synthesized different gods, or at least versions, into their one God, can be seen from the different sources of the Old Testament—which can arguably be broken up into the Deuteronomist, Yahwist, Priestly, and Elohist— and the various names of the Hebrew God, which are understood to have originally been different gods.

[1203] These ultimately relate to Tantric traditions involving concepts such as *kundalini*, which itself would make its way into Judaism in the form of the ten *seiferoth*, or the "Tree of Life," also found in Slavic tradition

[1204] Hillel had likely followed after another teacher called the *Teacher of Righteousness* (although some have considered Hillel to have been that teacher), often associated with the Essenes. A possibility is that the Teacher of

focused on the Golden Rule, an ethic of reciprocity. His teachings were far more liberal than those of Shammai, however. *The Zohar* and the Kabbalah had introduced the esoteric side of Judaism, while Gnostic Christianity and Sufi Islam would have many schools and texts. Like the Samaritans, many of the Jews, such as the Zealots, would come to revolt against the Roman Empire. Jews and Samaritans represent some of the earliest recorded revolutionaries and heretics of Hellenism and Christianity (and their own doctrines).

Originally considered a heresy itself, early Christianity was a branch of Judaism mixed with Greek and Roman and probably Eastern philosophy and gnosticism, perhaps coming from the Saka or even Shakya Muni himself, that was based around a mythological or legendary figure named *Yeshua*, *Jesus of Nazareth*, or *Jesus Christ*, who was said to have been an important prophet and the Son of God, a title that was usually reserved for kings and emperors, reminiscent of the god-kings of Asia. Proudhon said, regarding Jesus and early Christianity, that

> All at once a man appeared, calling himself *The Word of God*. It is not known to this day who he was, whence he came, nor what suggested to him his ideas. He went about proclaiming everywhere that the end of the existing society was at hand, that the world was about to experience a new birth; that the priests were vipers, the lawyers ignoramuses, and the philosophers hypocrites and liars; that master and slave were equals, that usury and every thing akin to it was robbery, that proprietors and idlers would one day burn, while the poor and pure in heart would find a haven of peace.
>
> This man — *The Word of God* — was denounced and arrested as a public enemy by the priests and the lawyers, who well understood how to induce the people to demand his death. But this judicial murder, though it put the finishing stroke to their crimes, did not destroy the doctrinal seeds which *The Word of God* had sown. After his death, his original disciples travelled about in all directions, preaching what they called the *good news*, creating in their turn millions of missionaries; and, when their task seemed to be accomplished, dying by the sword of Roman justice. This persistent agitation, the war of the executioners and martyrs, lasted nearly three centuries, ending in the conversion of the world. Idolatry was destroyed, slavery abolished, dissolution made room for a more austere morality, and the contempt for wealth was sometimes pushed almost to privation. Society was saved by the negation of its own principles, by a revolution in its religion, and by violation of its most sacred rights. In this revolution, the idea of justice spread to an extent that had not before been dreamed of, never to return to its original limits. Heretofore justice had existed only for the masters; it then commenced to exist for the slaves.
>
> Nevertheless, the new religion at that time had borne by no means all its fruits. There was a perceptible improvement of the public morals, and a partial release from oppression; but, other than that, the *seeds sown by the Son of Man*, having fallen into idolatrous hearts, had produced nothing save innumerable discords and a quasi-poetical mythology. Instead of developing into their practical consequences the principles of morality and government taught by *The Word of God*, his followers busied themselves in speculations as to his birth, his origin, his person, and his actions; they discussed his parables, and from the conflict of the most extravagant

Righteousness had been a Saduccee or Zadokite priest who had been opposed to Jonathan Apphus or his father Antigonas Mathatthais, Hasmonean dynastics. Hasmoneans had receieved the Edomite forced converts to Judaism (associated with the Biblical Esau) and would later be associated with Herod, who tried to hunt down baby Jesus in the Massacre of the Innocents

> opinions upon unanswerable questions and texts which no one understood, was born *theology*, — which may be defined as the *science of the infinitely absurd*. [1205]

Christianity would take philosophical influence from schools like Stoicism and neo-Platonism, Gnosticism, and mythological influence from Mithraism and perhaps even Taoism or Buddhism and Krishnaism. Concepts such as Heraclitus's *Logos*— "Reason," "the Word," "the Way," etc.[1206]— would be adopted for the ends of Christianity. Primitive Christianity, combining Jewish and Hellenistic elements and coming from groups such as the Ebionites and Therapeuts, took many forms and did not have a unified theology, with the various presbyters leading the various congregations from their interpretations of the gospels from their own philosophical or theological vantage points. Thus, we find that some of the early Christians maintained pantheist views, Gnostic views, unitarian views, universalist views, millenarian views, and other views that Christians today may find unfamiliar, as well as contradicting (to unitarianism) views like trinitarianism. While pantheists held that all of Nature as a united whole was God and Gnostics stressed a personal mysticism over dogmatism, *unitarians* held to the view that Jesus was not the Godhead but was instead an enlightened or inspired man or had some other connection to the Divine, *universalists* believed in salvation for every soul, and *millenarians* believed that a time of fundamental change would come to transition the world to a better way. *The Bible* has at least two accounts of Jesus's sanity being questioned,[1207] leading, along with his behaviors, some to question if Jesus would today be considered mentally ill while others have considered him to have "crazy wisdom." Some of these views are expressed in the various *apocrypha,* Christian texts that fall outside of the Catholic *canon*, or accepted scriptures. Like Lucifer—Lugh, Lugus, Loki—, Jesus, the *Logos*, would be known as the *Morning Star*.

Christians were made sense of by the Romans such as Pliny the Younger as being burial societies, or *hetaeria*. Christianity is to be counted among the mystery tradition, though was distinct from the state cults and distinguished itself in a number of important ways. An author using a more specific definition of the *mysteries*, referring to pagan traditions exclusively, holds that there was a parallel development going on between the pagan mysteries and Christianity, saying that the "similarities must rather be explained by parallel developments from similar origins." The author says further that the

> parallel development was fostered by the new conditions prevailing in the Roman Empire, in which the old political units were dissolved, and the whole civilized world was ruled by one monarch. People were free to move from one country to another and became cosmopolitan. The ideas of Greek philosophy penetrated everywhere in this society. Thus, under identical conditions, new forms of religious communities sprang from similar roots. The mystery religions and Christianity had many similar features[1208]

However,

> There are also great differences between Christianity and the mysteries. Mystery religions, as a rule, can be traced back to tribal origins, Christianity to a historical person. The holy stories of the mysteries were myths; the Gospels of the New Testament, however, relate historical events. [1209]

Despite the differences, though, Christianity wasn't all too different from the other mysteries.

[1209] N/A[4]

> In theology the differences between early Christians, Gnostics (members—often Christian—of dualistic sects of the 2nd century AD), and pagan Hermetists were slight. In the large Gnostic library [...] Hermetic writings were found side-by-side with Christian Gnostic texts.[1210]

Jesus, likely a half-Jewish heretic, has been claimed to have been from the Therapeutae,[1211] Zealots, Essenes, Ebionites, various Gnostic sects, and what would become the Druze, among others. He was a native speaker of Aramaic. The Arameans consider their origins to be from Chaldea, Phoenicia, and Assyria/Syria. Apotactics, in the tradition of the Tatians or Encratites, are associated with the apocryphal *Gospel According to James*, the half-brother of Jesus, and have been compared to the Manicheans and later Cathars. They were known for their condemnation of private property. Related Encratites drank water out of the eucharist instead of wine. Encratites opposed marriage and sex, believing them to be sinful. These were early heretics, opponents of the Apostle Paul[1212] who would go on to inform mainline Christianity. If James, the apparent half-brother of Jesus, had been an Encratite, then perhaps this is the tradition from which Jesus comes. Joseph McCabe held that Jesus was likely an Essenian religious leader who was turned into a legend through oral hearsay. Similar to McCabe, Jan Irvin and Andrew Rutajit have explored the astrotheological origins of Christianity, and point out that "early Christians" were,

> actually Gnostics, and Mithra and Krishna (sun) worshippers—the Therapeuts, Zadokites, Essenes, and others. The Roman Empire's official religion became Christianity under Constantine as he created a *one-world religion* from the doctrines of all existing religions. Thus was born the "Roman Catholic Church" (*Catholic* means "universal") and Constantine the religious *and* secular leader of the new Christian state authoritarian patriarchy.[1213]

Recently, Ammon Hillman has stirred up some controversy by claiming that Hebrew comes from Greek,[1214] the *Septuagint* is the original *Bible*, predating the *Torah*, and that by translating the Ancient Greek he discovered that Jesus was a sort of black magician and pederast, and that this was a basic continuation of the mystery schools. Whether this is literal fact or interjection by ruling class Saturnalians is not certain, and Hillman has certainly faced a lot of backlash for his blasphemy. The major merits of his case rest on the fact that Jesus, when disovered with a naked boy or young man in the garden, declared that he was not a *lestes*, which Hillman finds is used as a descriptor by Romans of child-trafficking pirates, whom were customarily crucified. If true, this suggests either that Jesus was not as great of a guy as he was made out to be, or that he was smeared by the *literati* of the time, the equivalent of the mass media for the time.

Michael Bradley holds that it was John the Baptist who truly founded Christianity-proper, suggesting it has even deeper Egyptian or Atlantean origins, suggesting that Moses may have been the Pharaoh Akhenaten, and that King Tut, his son, may have been the inspiration for the biblical Jesus.[1215] Bradley holds that Christianity as a polytheistic worldview actually came from Copper Age Western Europe rather than Iron Age Canaan, coming from the Atlantic Coast to the Nile River Valley, where it appeared

[1215] See Bradley[1]

as the Egyptian religion. John the Baptist was the man who baptised[1216] Jesus, and is considered a forerunner of Jesus by many Christians and other believers in Jesus. Jesus had referred to John the Baptist as "Elijah who has come," perhaps a reference to his being something of a *Messiah*, or savior-figure, himself. Jesus had also been compared to Elijah. Elijah had, like Enoch, been taken to heaven without dying. Like Jesus, Elijah is said to have been resurrected, having appeared to Jesus's apostles, Peter, James, and John. Interestingly, Jesus has also been compared to Enoch, with some esoteric traditions holding that he was the re-birthed form of Enoch. The *Gospel of John* holds that Jesus and John the Baptist were relatives. Like Jesus, John the Baptist was critical of the Pharisees (and Sadducees) and was sentenced to death as a heretic (according to Josephus), being beheaded by order of Herod. He is revered by the Mandeans as the last of the prophets.

Ephraim Squier suggests that there is a leading semi-mortal figure that is associated with the perennial mythos found in primitive and ancient religions across the world, saying that in

> almost every primitive mythology we find, not only a Great Father and Mother, the representatives of the reciprocal principles, and a Great Hermaphrodite Unity, from whom the first proceed, and in whom they are both combined, but we find also a beneficent character, partaking of a divine and human nature, who is the Great Teacher of Men, who instructs them in religion, civil organization, and the arts, and who, after a life of exemplary usefulness, disappears mysteriously, leaving his people impressed with the highest respect for his institutions and the profoundest regard for his memory. This demi-god, to whom divine honors are often paid after his withdrawal from the earth, is usually the Son of the Sun, or of the Demiurgic Creator, the Great Father, who stands at the head of the primitive pantheons, and subordinate only to the Supreme Unity; he is born of an earthly mother, a virgin, and often a vestal of the Sun, who conceives in a mysterious manner, and who, after giving birth to her half-divine son, is, herself, sometimes elevated to the rank of a goddess. In more refined and systematized mythologies, he appears clearly as an incarnation of the Great Father, and partaking of his attributes, his terrestrial representative, and the mediator between him and man. He appears as Buddha in India; Fo-hi in China; Schaka in Thibet; Zoroaster in Persia; Osiris in Egypt; Taut in Phoenicia; Hermes or Cadmus in Greece; Romulus in Rome; Odin in Scandinavia; and in each case is regarded as the Great Teacher of men, and the founder of religion.
>
> In the mythological systems of America, this intermediate demi-god was not less clearly recognised than in those of the old world; indeed, as these systems were less complicated, because less modified from their original or primitive forms, the Great Teacher appears here with more distinctness. Among the savage tribes his origin and character were, for obvious reasons, much confused; but among the more advanced nations he occupied a well-defined position.[1217]

There may be no telling for sure what Jesus's actual "tradition" was if he followed one, likely because his views had themselves involved learning from a wide range of traditions and a combining of their insights, an example of intercultural hybridization. It is interesting to note that many of the influences pointed to by Irvin and Rutajit involve Indo-Scythian or Persian roots. The Therapeuts, for example, have been connected to Theravada Buddhism, the oldest extant tradition in Buddhism, called also the *Doctrine of the Elders* (though Bradley considers them a native Egyptian tradition). The Theravadics opposed the doctrine of the Mahayana Buddhists, which showed up at a similar time to Rabbinical Judaism in India, still preserved in Tibet and China, often associated with Nagarjuna and his teachings

[1216] *Baptism* is a ritualistic cleansing of the soul by water. John the Baptist did this in the Jordan River, where he would submerge people for purification.
[1217] Squier

of *emptiness*, the idea that there is no fundamental reality, which had followed soon after the development of the concept of *mathematical zero* in India by Pingala and others.[1218] Today, Christianity celebrates *Christmas*, its main holiday said to be the birthtime of Jesus, but which actually corresponds to the Winter Solstice and Roman celebrations of Saturnalia.[1219]

Christianity appears to have begun as a movement supported primarily by the lower classes, with Jesus acting as a sort of heretic and revolutionary. However, the Christ myth, with its "son of God" rhetoric also seems to echo the efforts of the Titans, perhaps anticipating Romantic or postmodern populist dynamics, such as those involved in the Reign of Terror. Opponents of Jesus see him as having co-opted Jewish, Samaritan, and other resistance movements, perhaps from people such as Mani, John the Baptist, or Apollonius. Proponents often count him among these others. Josephus apparently records him this way (though it has been criticized as possible Christian interpolation):

> Now, there was about this time Jesus, a wise man, if it be lawful to call him a man, for he was a doer of wonderful works-a teacher of such men as receive the truth with pleasure. He drew over to him both many of the Jews, and many of the Gentiles. He was Christ; and when Pilate, at the suggestion of the principal men amongst us, had condemned him to the cross, those that loved him at the first did not forsake him, for he appeared to them alive again the third day, as the divine prophets had foretold these and ten thousand other wonderful things concerning him; and the tribe of Christians, so named from him, are not extinct at this day.

Whatever the case, Bart D. Ehrman, in "Christianity and the Defeat of Paganism," suggests that a small group surrounding Jesus were responsible for starting Christianity, saying that

> Christianity started out with a tiny group of 20 people, or followers, who had accompanied Jesus of Nazareth to Jerusalem. The New Testament describes them as those belonging to [the] lower class. They were Aramaic-speaking uneducated Jews from a rural, nondescript part of the empire.[1220]

Hugo Grotius described the early Christians as an eclectic group of free thinkers.[1221] He said, in his *Prolegomena to the Law of War and Peace*, that the "early Christians" had

> sworn allegiance to the sect of no one of the philosophers, not because they were in agreement with those who said that nothing can be known—than which nothing is more foolish—but because they thought that there was no philosophic sect whose vision had compassed all truth, and none which had not perceived some aspect of truth. Thus they believed that to gather up into a whole the truth which was scattered among the different philosophers and dispersed among the sects, was in reality to establish a body of teaching truly Christian.[1222]

[1218] Concepts like *zero* existed before this, but this was a major point of popularization of the utility of the concept in math

[1219] Saturnalia involved the worship of Cronos, the god who cannibalized his own children, and is associated with the planet Saturn, which the Saturday-as-Sabbath Jewish religion is also affiliated with

[1220] Ehrman

[1221] In many respects, philosophical and religious syncretism was also the goal of the later heretical Christians and Jews, and radicals, of which Mutualism seems the best example. Mutualism, unlike the political philosophies— that are oriented toward one or another "ism" based in something particular, and not in mutuality, which itself is not particular (like a commune is, or capital is, for instance)— seems the best example of Grotius's "early Christian" ways. Mutualism certainly grew out of an earnest attempt to live according to the Golden Rule.

[1222] Grotius, 27

Similarly, the conservative Roman pagan philosopher Celsus, perhaps the oldest critic of Christianity on record, popularly criticized it on the grounds that, not only was it a religion of peasants, but that its scholars would "weave[1223] together erroneous opinions drawn from ancient sources and trumper them aloud." He felt that Christians were overly eclectic, and held too many diverse views together. Further, and interestingly enough—because advocates of primitive Christianity often oppose secrecy—Celsus opposed Christians for their having "entered into secret associations with each other contrary to law."[1224]

Jesus— or Yeshua, Joshua— had opposed the Pharisaic money-lenders of what would become standard Rabbinical Judaism,[1225] and abhorred their usury. *Usury*, which today refers to the subjective "excessive interest," but which originally referred to any interest (but especially on money) has been opposed in many of the world's major religions, including Hinduism, Judaism, Christianity, and Islam. Secular society also opposed it.[1226] One of the major problems associated with usury is that people would incur debt because their crops failed, turning them into debt slaves.[1227] Jewish society would practice what is called *jubilee*, a time when all debts are erased, as a resolution to some of the problems of wealth accumulation that persisted despite their opposition to inward usury, so that even non-interest-bearing debts would be forgiven: "Forgive us our debts as we forgive our debtors." Jesus says,

> the hour is coming when you will worship the Father neither on this mountain nor in Jerusalem. You worship what you do not know, we worship what we know, for salvation is from the Jews.[1228]

Jesus taught that people should love their neighbor as their brother, that each should do to others what they would want done to themselves, and that it was easier for a camel to pass through the eye of a needle than for a rich man to go to Heaven. He said to "[g]ive unto Caesar what is Caesar's, and unto God what is God's," referring to state money vs. community. During Passover, and for preparation of his crucifixion, Jesus had eaten a meal with his disciples called *the Last Supper*, whereat Jesus administered the *eucharist*. The *eucharist* refers to sacramental bread and wine. The bread is supposed to represent the body of Christ and the wine his blood, which one eats still today at Mass. This is clearly symbology associated with sacrifice and cannibalism. Jesus had predicted to his disciples that he would be murdered. He was said to have been crucified on a tree or cross, which mythologically provided a

---

[1223] Perhaps not an accidental pun, as the radicals were often weavers

[1224] Not much of a law if something can run counter to it, is it? Can you imagine something contradicting the laws of Nature? What makes the laws of Nature laws, truly stated, is that they cannot be contradicted. Human laws are only laws insofar as they are statements of natural laws. Otherwise, they can be broken.

[1225] Rabbinical Judaeism is that which follows the Babylonian *Talmud*.

[1226] Usury was traditionally associated with sodomy. Aristotle had held that both were attempts to produce something in crude and unnatural ways, and they were justified together by people such as Jeremy Bentham during the Enlightenment.

[1227] The Mutualists, coming from an older tradition concerned with "just prices," would come to oppose the monopoly on the basis of money—usually precious metals—as well as usury, and would instead promote the idea that anything with value can be used as a basis for currency. They believed that market competition, as it relates to currency, would push the price of money—interest— to its cost, and since paper money is merely representative, and the cost of creating representation is low, this would be from zero to one percent (one percent paid from money that is, in fact, issued into being! Interest paid from out of the principal, not interest paid atop that). Such a situation is currently hampered by legal tender laws and even by anti-usury laws. The Mutualists supported, instead, monetary freedom.

[1228] *John* 4:21-24

means of forgiveness for original sin, serving as a sort of surety, afterwards coming back to life. He is said to have had been a perfect man, of a perfect life,[1229] born of a virgin mother.

Early Christians called their path *the Way* in something of a Taoist manner, which has led some to wonder if a Taoist or Buddhist influence, perhaps through proto-gnosticism or from Eastern religion being spread along the Silk Road into Europe, was an inspiration to the Christ legend.[1230] Michael Cheilik says that "Christianity began to build an excellent structure to weather the increasing intolerance," and that the "basic appeal of Christianity was similar to that of the mystery religions, in its teaching of personal immortality and an afterlife as the reward of faith and good deeds."[1231]

Christianity would grow in popularity, especially among the Hellenistic poor, and, like Judaism, it was a revolutionary force, but one that pagan gentile and Jew alike joined in on. Many of the early Christians faced persecution by the Romans, and Christianity was seen as a subversive force by some rulers. That's largely why it had to be co-opted and administered, leading to the Council of Nicea, among others. By Irvin and Rutajit's order of thinking,

> The Christian "savior" is actually the sun, which is the "Light of the world that every eye can see." The sun has been viewed consistently, from time immemorial, as the savior of human kind for reasons that are obvious. Without the sun, life on this planet would not last for very long. So significant was the sun to the ancients, that they composed a "*Sun Book*," or "*Helio Biblio*," which became the *Holy Bible*.[1232]

As they see it, at the Council of Nicea, "Emperor Contantine literally created Christianity. Constantine was in no way *converted* to Christianity; he created it."[1233]

Apollonius, a neo-Pythagorean ascetic philosopher and— according to a Sophist, being of Tyana, and so— a Greek, has often been compared to Christ, having been born around the same time. Some say figures of his sort were common to the Mediterranean. Named after the Sun god Apollo, son of the Olympian Zeuss (*God* is *Deus*), his famous works include "On Sacrifice," and he was known to be a miracle-worker who had, like Pythagoras (and arguably Christ) in his exploits, traveled across Europe to the West, and as far as Ethiopia in the South and India in the East. *Apotheosis*, from *Apollo*, has to do with deification, especially of a human, similar to *henosis*. Appolonius, who opposed the "religion of the book," had taught that God does not need worship and that prayers do not move God—whom he calls the "*Great Architect*"—, but that the use of Reason or *nous*, "the mind," is a means of connection with the Divine because that is what the Divine is. He praised tyrannicide, which he had witnessed at the death of Emperor Domitian, and may have personally met the Indo-Parthian King Phraotes (remember, the Three Wise Men who had set out to meet Christ were Parthian magi). Porphyry and Hierocles speak of Apollonius as a miracle-worker superior to Jesus, and Enlightenment deists often embraced Apollonius as sharing their values of universalism and Reason. It is quite possible that Apollonius himself, or some Hellenistic Canaanite of his *milieu*, had been melded with Judaism, Mithraism, Stoicism, neo-Platonism, and a number of other worldviews, into Catholicism, making the Christ figure

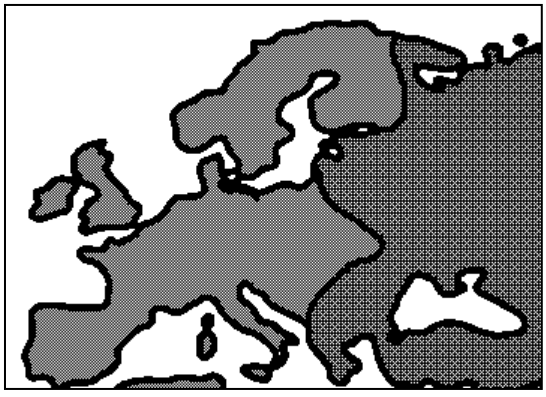
---

[1229] Some Gnostics claim that Enoch had been taken to heaven to become the angel Metatron, only later to be born as Jesus Christ. This is no doubt influenced by the doctrine of the "transmigration of the soul" or reincarnation, as was taught by Pythagoras and as is currently believed by people such as the Druze. Speculatively, this may, itself, ultimately be sourced in practices of backcrossing, introgression, or etc., which are known to preserve genotypes.
[1230] It's interesting to note that both Jesus Christ and Lao Tzu have been independently claimed as the ancient originators of anarchism
[1231] Cheilik, 225
[1232] Irvin and Rutajit, 33
[1233] Irvin and Rutajit, 16

something between a legend and a myth, and thereby giving ground both to Anabaptist and unitarian conceptions of Jesus— as a common man separate from God— and, paradoxically, to trinitarian and mystical conceptions such as those of Joachim of Fiore or Eriugena and Meister Eckart. It may be that the trinitarian element of some Christian denominations comes from pagan sources, such as from Mercury gods like the "Thrice Great" Hermes or the triadic Lugh. Of course, Christianity also took much from Judaism, as well, of which it was a derivative. Judaism had taken after Samaritanism, Atenism, Zoroastrianism, and ultimately Vedism or Hinduism, in their monotheism— much as Hellenic religion would do with Zeuss—, developing out of the Canaanite pantheon, perhaps with gods sourced elsewhere as well.

The narrative of Jesus's similarity to other deities, and particularly Solar deities, leaves one to wonder if there was a Jesus at all, or if the whole thing is an astrotheological allegory for Jesus's role as a savior from usury, similar to the Sun being a savior from cold and darkness. Whether Jesus was a myth or a legend based around a historical figure, or both, may never be known for sure, but for some is a matter taken on faith. Regardless, the Christ myth or legend would go on to inspire many followers, called *Christians*.

Some of the tendencies of early, rabble-rousing Christians would carry on as heresies once Christianity would become established as the dominant religion in Europe, largely through the Catholic Church. The Romans had persecuted the Christians much as they did the Jews that they had come from, before legalizing Christianity and, combining it with pagan elements as from Mithraism, adopting trinitarian Christianity, as that of the Apostle Paul, as the state religion, thereby starting the Roman Catholic Church. The Council of Nicea would become a defining moment in the new Church's history, condemning the unitarianism of Arius in the Arian Controversy, and establishing the Nicene Creed. Many of the pagan folk religions (some from whom Christianity appropriated) would build resentment against Christianity for what they felt was a foreign religion displacing their indigenous beliefs. Pagan sentiments, as well as heretical and Protestant Christian beliefs, would eventually pose themselves as threats to the established Catholic order, as would reformists within the Church. The Church would also break up into *East* and *West* or *Catholic* and *Orthodox* during the *Great Schism*, divided between the Eastern Roman or Byzantine Empire and the Western Roman or Holy Roman Empire.



General ranges of Roman and Byzantine Catholic influences
(Note: many of the areas marked were not ever fully Catholicized)

As Judaism represents the movement away from Canaanite polytheism and toward kahenotheism, henotheism, and then monotheism, and as Christianity played a similar role with Hellenistic religion, Islam would be the monotheizing force for Arabic polytheism. Abraham was the founder of Hebrew religion, from which the Jews of Judah, the Christians of Christ, and the Muslims of Mohammed would

come. *Muslims*, of course, are the followers of Islam, and *Mohammed* was a prophet who is seen by Muslims as falling into a line of prophetic succession, taking the place of Abraham and Jesus, both seen as legitimate, as the final prophet. Unlike Catholicism, however, which would unite a trinity in a corporate unity as God, and more similarly to the views of unitarian Christians and later Druze, Muslims hold to the view that "there is no God but Allah and Mohammed is his prophet," holding to the principle of *Tawhid*, that God is One, speaking specifically against notions of trinitarianism and polytheism, which are seen as related views. *The Quran*, the Islamic *Bible*, speaks of a Babylonian trinity worshipped by Abraham and his people, which was polytheistic and astrotheological. The Sun, Moon, and Venus were worshipped by them especially, being understood as a triad. Abraham, according to *The Quran*, had worshipped Venus, the Moon, and the Sun in succession, decrying each as his Lord, following his decrying of the Sun with "O my people, indeed I am free from what you associate with God." In Christianity, gods were turned into angels and demons. In Muslim society, such as in Abbasid society and as is pointed out by people such as Samer M. Ali in his paper, "Early Islam—Monotheism or Henotheism? A View from the Court," god-kings (such as were featured prominently in Southeast Asia also, I might add) had been incorporated into henotheism under Allah.

Islam is most natively Arabic, but has also found its home among Berber or Moorish people after the Arabization of North Africa and admixture with North Africans, as well as among Turkic and Mongolic peoples, whose native Tengrism derived from the Mongols—and related worldviews— allowed for the worship of any deity of any religion, seen as one of the many manifestations or understandings of *Tengri*, the shamanic god of Mongolic and Turkic steppe peoples, related also in some respects to the proto-Nordid and the Lapp people as well, and thereby to Sami shamanism, Rodnovery, and Vedic religions such as Hinduism. Islamic presence and influence reaches from Ibero-Maurusia and across North Africa, into Arabia and Central Asia, and down into the Indies. Especially important Muslim civilizations, in regard to their impact on Western society, have included the Rashidun, Ummayad, and Abbasid caliphates and the Seljuk, Ottoman, Safavid, and Mughal empires, and various incarnations of Turkic Khaganates and Mongolic Khanates, as well as the Tartar or Tatar confederations, these all generally being important to European society especially owing to their proclivity to establish trade blockages and demand tribute from merchants along the Silk Road, something that they had inherited from older steppe peoples such as the Yuezhi, Huns, Goths, pre-Islam Mongols, Parthians, and many others.

Like Catholicism and its East-West Schism between the Roman Catholic and the Eastern Orthodox churches, Islam would be divided primarily between Sunni and Shia Muslims. Like Christianity, but perhaps more vehemently, Islam is opposed explicitly to usury, and, like certain denominations of Christianity, as well as Ancient Egyptian religion, hold that good deeds are important along the path to salvation by God and a place in Heaven. Abraham, according to *The Quran*, the holy book of Islam, was told to sacrifice Ishmael, not Isaac, and Ishmael is understood to be where Islam comes from by way of Mohammed. *Ishmaelism*, or *Ismailism*, is an especially influential branch of Shia islam, while *Sufism* has become especially prominent among Sunni and Ismaili Muslims. These would be especially associated with the esoteric aspects of Islam. The Druze would associate themselves, though quite questionably, with Isma'ilism.

Nordic Judaeo-Christian Rulers

"The Jutes actually arrived first!" exclaims the author for the United Church of God, telling of the expedition of the Jutes to establish Kent (now a part of London), led by Hengrist and Horsa, in England. Discussing a skeleton discovered with "the finest single object he unearthed," Bryan Fausset

suggests, in *The World of the Past* edited by Hawkes, the individual, a Jute from Kent, had a "remarkably small" head that "seemed to have what we call a very low or short forehead."[1234] The Jutes of Kent built a giant underground grotto with ornate shell walls, known as the *Shell Grotto*. Its origins are not certain, some having suggested Phoenician origins despite its Gothic-style pillars. The archaeology of Kent has also uncovered a material culture that had overlaps with the Frankish culture of continental Europe. As Tom Rowsell reports, in "Debunked: Anglo-Saxon Diversity: Uptown Girl,"*Uptown Girl* refers to a quarter-Congoid (*Quadroon*) mulatto female from Kent, around the time of the spread of Christianity. She is said to have had Frankish and Arab DNA, perhaps Berber, and was buried with a Frankish pot. A similarly Quadroon skeleton was similarly found in Dorset, [1235] where the Vikings famously raided. The Jutes had been followed by the Angles and Saxons, establishing Germanic English rule over the Celtic Britons, and then again by the hybridized and somewhat Romanized Germano-Celtic Normans, or Jutes/Danes who had conquered Southward into Gallo-Roman territory.

The Jutes[1236] are basically the Ashkenazi Jews, or German Jews, with *Jew* referring to the home of Judea or Judah in Israel, which was established by the Jat people, a caste that was prevalent in Indian and the Middle East, who had been known in Canaan as Judahites. Jews, with their lines by way of the Radhanites to the East using a short sea voyage down the Red Sea and into the Arabian Sea, as well as their ancient land connections established as far back as their time as the Yuezhi, have long maintained relations with the East, bringing statism and religion to the West. All in all, we come to find out that the Jutes and the Goths[1237] were basically the same Germanic peoples, related to other Germanic and Iranic peoples, and that they came from a common source with the Jats,[1238] a people associated with the landed gentry, moneylenders, and merchants of the *Vaishyas*. The Jats, or *Juts* as they are called in the Caucasus area,[1239] were a caste of landlords, merchants, and bankers who revolted against Brahminism. Merchants related to the Radhanites, they had been connected to the emerging maritime trade off of the coast of Elamo-Dravidian society, perhaps after their having been conquered by the Indo-Aryans. Speakers of the Hebrew tongue of Canaanite language family, similar to the Radhanites, though perhaps non-natively, they were, in common with the Phoenicians, a maritime superpower of the Mediterranean, members of the Canaanite society.

Jats, or Jews, in the form of the Jutes, and other Ingvaeonic peoples (Angles, Saxons, Frisians), and, with help from Radhanites and Catholics, established themselves as the ruling class of the Germanic peoples and then others around them, giving way to what others have called the *Norman yoke*, spreading especially after the reign of William the Conqueror after his defeat of the English and their King, Harold Godwinson, at the Battle of Hastings. Christianity had existed in England before the Norman invasions, in the forms of Celtic and Roman Christianity, and according to Bede had already caused the decline of Anglo-Saxon paganism. Christianity was especially prevalent in Kent early on. The King of Kent had married a Frankish Christian princess, before being made the target of Gregorian missionaries. But when the Normans invaded, under William the Conqueror, Christianity was enforced

---

[1234] Hawkes, 446
[1235] See Rowsell
[1236] And also the Khazars
[1237] *Goth* basically refers to a Jat *Gotra*, a clan. *Goth* means "clan," so *Goths* refers to a network of clans.
[1238] The author for the United Church of God, relying on the work of Stephen Collins, suggests that the Jats may have been Judahites, and points to further connections to the Chinese Yuen-chih or Yuezhi (remember that "J" is pronounced like a "Y" in some parts of the world) as relatives of the Tocharians and the White Huns (the Huns are also related to the Han Chinese), as well as to the Jutes. I might add the Yuan.
[1239] They are also called *Tats* in the Caucasus (and in Iran). Jats, as a larger complex, have very many names, ranging from *Jatti* to *Zatti* or *Tati* and from *Gute* to *Jut* and beyond.

unlike it had been before, and almost all of the lands in England were confiscated and put under feudal tenure, becoming the allod of William the Conqueror. Benson says that the

> Norman kings used law and law enforcement to generate revenues needed to finance their military operations, to enhance their own wealth, and to buy the support of powerful groups. In this regard, one of the earliest and most significant changes the Normans made in English law was replacing the old restitution-based system [...] with a system of fines and confiscations along with corporal and capital punishment.[1240]

The European peasantry had become increasingly concerned about the presence of these tax-collecting, land-claiming, money-lending Jat foreigners, including the Normans and their terrible yoke, but especially their allies the Radhanite (Babylonian) Jews, who were clearly foreigners, giving way to such events outside of England as the Rhineland Massacres and leading up to such minstrel ballads as *Sir Hugh* or *The Jew's Daughter*, about "Little Saint Hugh" of Lincoln, who was said to have been a victim of blood libel and Jewish sacrifice.[1241] Ashkenazi Jews having spent time in Babylon and having taken up a Semitic language, and unlike Christians practicing usury, stood out among the other Germanic peoples. When it comes down to it, though, Jews, Jutes, and Anglo-Saxons (Samaritans) are very close relatives. Roger Waite asks, in "The Jewish Roots of the Nobility of Europe," "[w]ho are the nobility?" To which he answers, "[b]y far their most common origin is simply the extended family of royalty."[1242] A writer for the United Church of God writes, in *The Throne of Britain*, that

> the royalty of Europe is descended from Judah's son Zerah, in accordance with the prophecy that the scepter would not depart from Judah (Genesis 49:10). Indeed, the royal house of Britain is a fusion of the lines of Zerah and Judah's other son Perez through his descendent King David. Because of intermarriage, the other royal houses of Europe are Davidic as well.[1243]

Come the time of the birth of Jesus, he was apparently supposed to receive the divine blessing, which was passed down to him through the kingship line of King David.[1244] The author points out that "through long ages royalty and nobility rarely intermarried with commoners," and that the origin of the nobility or aristocracy is as "the extended family of the royalty" and "landowners of the remote past,"

[1240] Benson, 47

[1241] According to the Online Etymology Dictionary, *Jew* was a word that had been used to refer to Roman coins in England, *Jewish castle* referred to the ruins of pagan temples, and *Jew's house* referred to tin-smelting facilities. This perhaps goes back to the time of the Gutians. It says that *Jew* (like the word *Gypsy* or *Gyp*), as a verb, had come to mean cheating or driving a hard bargain. The editors suggest that "The campaign to eliminate [Jew as a term with negative connotation] in the early 20c. was so successful that people also began to avoid the noun and adjective, using Hebrew instead" (Etymology Online[2])

[1242] Waite

[1243] United Church of God

[1244] However, we are told that Joseph, son of David, was not actually the father of Jesus at all, but was his stepfather. All kinds of theories exist to account for this, from it all being a myth, to Jesus being the son of a prostitute, to Jesus being the product of Enochian sex magic, and etc. Another plausible explanation, and one of my own, is that the Old World Order involved a system whereby "God," likely the title of a person in Tibet, had the right of first night with Mary, the wife of Joseph, who was himself in the line of David. Exoterically, then, Joseph was the father of Jesus, except that Jesus was born of a "miracle." Esoterically, Jesus was the son of the ruler of the world. This may just have been how things operated behind the scenes, to create a sort of "trickle down" effect of the ruler's genetics. This sort of hypergyny may have been involved in early fealty relationships as well, intertwining families with the lineage of the ruler. While the father would not be attached to the progeny of the ruler except by way of fealty, the mother nonetheless would be, and this within the context of a gynocentric patriarchy.

who had the land "either granted by the king or it was conquered and taken."[1245] Roger Waite continues, telling us that the "royal houses of Europe are Davidic," saying that the "other origin involves descent from the landed gentry—that is, landowners of the remote past."[1246] These landowners had been able to conquer others through war. They acquired the land by Right of Conquest. Waite says further that the "early Scot overlords were Jewish."[1247, 1248] While the United Church of God claims the royalty to be Jewish—in this case, Judahites—, the nobility is their extended kin, including the Scots, Anglo-Saxons, and others. Scots are said by some British Israelists to be a people whose ethnogenesis involves a Scythian and Egyptian (by way of Pharaoh's daughter, Scota) synthesis, an idea derived from the "Declaration of Arbroath," in a passage that concludes that the Scots had

> journeyed from Greater Scythia by way of the Tyrrhenian Sea and the Pillars of Hercules, and dwelt for a long course of time in Spain among the most savage tribes, but nowhere could they be subdued by any race, however barbarous. Thence they came, twelve hundred years after the people of Israel crossed the Red Sea, to their home in the West where they still live today.

Further, there are claims that this trip involved the transport of the Davidic, and so royal, lineage to Scotland, which later is said to have been moved to England. This idea holds that the prophet Jeremiah and Baruch, his scribe, had taken the King Zedekiah's daughters to Egypt, later going to Ireland, where the daughter married a *High King of Ireland*—a king with claim to the totality of Ireland—, thereby transferring the title to the throne. Others hold that Britain and the United States are the tribes of Ephraim and Manasseh, thereby making them the holders of Jacob's title to Esau's birthright. Britain and the United States, as Ephraim and Manasseh, are understood to be the holders of the birthright, as according to *Genesis* 48 wherein he also gave to Joseph the "ridge of land [...] I took from the Amorites with my sword and bow," a clear indicator of Biblical titles to property, which are rooted in aggression. Jews, as Judah, are supposed by some Britsh Israelists to be the head ruler. In something of a sympatric or dyadic system between the Saxons and the Jews, the Saxons would take the land as the landed gentry, while the Jews would take the lending of money and merchandising as bankers.[1249] In traditional Jat lands, however, the *Vaishya* do both. The sympatric system was a more recent innovation. The Saxons became the nobles and the Jutes the royalty. The Saxons tended to prefer their native paganism, defected to from Samaritanism and much more like the original Aryan beliefs, to Judaism at first, but did succumb eventually to Christianity, adopting the God of the Jews and the narrative of Judaism as their own.[1250]

[1245] United Church of God
[1246] Waite
[1247] Waite
[1248] Scots, whom the author says are related, have long been associated with the Scythian expansion and with Ancient Egypt
[1249] Relationships like this are not entirely unheard of, as "man marriages" between tribes and their chieftains in the Kula Ring resemble in certain respects the kind of "gendered" division of interests that might be interpreted from this kind of sympatry. Similarly to some oceanic cultures, as well, Jewish and Anglo-Saxon societies often distinguish between the spheres of women and of men, and thereby their roles and expectations. In Anglo-Saxon administration of land, and Jewish administration of money and trade, one might infer a kind of internal-external dynamic, not entirely like that between the housewife who runs the home and the breadwinning husband who deals with others from outside. Quite similarly, the first chiefs were male war chieftains, tasked with leadership in times of war against external enemies, whereas councils of women elders would often maintain considerable say in domestic affairs.
[1250] Populist reactionary religious movements in Scandinavia and Germany often take the form of neo-paganism in rejection of the Jewish god, perhaps involving some degree of a lack of awareness of the deity's native Jutish home, but perhaps also disapproval of this in favor of pre-Jutish influences growing natively from out of the Battle- Axe and related cultures.

Bertrand Comparet says, however, in "Was Yahshua a Jew?" that Jesus was not in fact a Jew, at least not a follower of Judaism, because the Jews, he says, were followers of the *Babylonian Talmud*, whereas Jesus was opposed to this tradition. He says that

> Yahshua was not a Jew by religion. The Jews based their religion on the Babylonian Talmud, which was at that time called the tradition of the elders. Yahshua's whole ministry was one constant battle against the evils of Judaism. We have learned that Yahshua was a true Israelite of the tribe of Judah, by race.[1251]

This is something of a contradiction if we take *Jew* to mean "from Judah," because if Jesus came from Judah then he would certainly be a Jew. Comparet, here, is not being careful enough with his language. What he really means is the *Rabbinical Jews*. If we forgive him for his mistake, we learn that Jesus was anti-Rabbinical,[1252] most Jews today being Rabbinical Jews, leading Comparet to generalize as he did. He says, clearing this up a bit while making the same mistake,

> The tiny remnant which came back to Palestine from the Babylonian captivity, did include a few descendants of true Judah, Benjamin and a smattering of Levites, and these were Yahshua's sheep. He said He knew them, they knew Him and they followed Him. All those in Palestine who became Christians were true members of the tribes of Judah or Benjamin. The [Rabbinical] Jews weren't [pure] members of any of the tribes of Israel, for Yahshua said they were not of His sheep. [1253]

Comparet says, "the people that are called Jews today, moved Northeast into the Khazar kingdom." This is a common notion, and it does seem to be largely correct. The Khazar Empire, connected with the Radhanites, was the only explicit and widescale Jewish state, perhaps owing to being co-opted, as Jews tend to see the role of their religion as tearing down other religions and nation-states or empires. The Khazars had actually been a largely Turkic, but also Congoid,[1254] people of the Tengrist religion, a religion that is very adaptive and willfully takes the form of other religions, in this case Judaism. But the Jutes of Northwest Europe had been Jews of the sort that would be acceptable to Comparet, and were counted among the Anglo-Saxons. It's not impossible that the Khazars did in fact have some Jewish elements to them, left over from the exploits of the Yuezhi.[1255] However, Comparet's point misses the fact that the Jutes are also Jews of a sort; that Jews, as Jutes, became the royalty of Europe and Russia.

For comparison, Jesus is understood in the *Talmud* to have been the son of a Jewish prostitute, Mary, whom had been impregnated by a Roman soldier named *Pantera*. I have seen it claimed that, due to the specific hardships of Jews under Roman control, "working women" who became impregnated were

---

[1251] Comparet[2]

[1252] That Jesus was anti-Rabbinical is interesting, especially considering that he is often associated with the teaching of the Golden Rule, which is said to have been derived from the Pharisaic leader Hillel the Elder. Hillel had taught "That which is hateful to you, do not do unto your fellow." This did not stop Hillel from giving a slave to a nobleman, rather than freeing him.

[1253] Comparet[2]

[1254] "Abkhazin negroes"

[1255] Comparet, like many preachers, is very charged, and comes to very pointy conclusions. He is, nonetheless, a learned man that we can learn something from if we are willing to challenge his sources, and does appear to be a valid source of a conservative ruling class perspective. It does appear that there is a Khazarian element at play in world politics, which some of the Anglo-Saxons have described as *Khazarian Mafia*. Nonetheless, it seems all-too-often that this is used as a means to let Anglo-Saxons off of the hook for their own wrongdoings. If we consider the criticisms of the Khazarian Jews to have any merits, we must also consider the criticisms levied against the Anglo-Saxon Christians. And, indeed, we find that they, too, are more than happy to extract usury from us, not as often in the form of interest, but quite often in the form of rent and profit. They have also been more than happy to rule over others as nobility. When we look at both sides, we find a familial dispute, each pointing fingers at the other side.

considered to be virgins by men of the lower class. However, the Pantera story is rejected by many Christians as pure defamation. Others claim that the virgin birth is better accounted for by a magical practice called *Hieros gamos*, which refers to a theurgical sexual ritual in which humans, representing or embodying deities called down from Heaven to possess their bodies, have sex, leading to the deification of the resulting child. Others hold that Mary had been a hermaphrodite, perhaps chimaric or a hybrid, and that pregnancy occurred through *parthenogenesis*, asexual reproduction. Rejection of the virgin birth has been seen among the Ebionites as well among some of the Unitarians. Christians take the idea very seriously.

Clif High holds— in a video possibly not titled by him,[1256] "Saxons Forbid Slavery and Name Stealing Since Thousands of Years"— that the Saxon and related peoples, as lovers of freedom, had, during the Middle Ages, been fiercely against slavery as well as the "original sin" of "*name stealing*," meaning to change or distort the meaning of words, to lie, or otherwise engage in a half- or non-truth.[1257] He does this based on his reading of the *Oera Linda Codex*,[1258] a controversial Saxon history that is said to have been privately kept, sourced from oral teachings and written down by hand. An author whose name is not given sums up Clif's video in "Yuletide // A Time of Personal Sacrifice," saying of the concept of *name stealing* that

> In the codex, the beliefs of many of these tribes are described. And when we find the word *sin* in these writings, we learn that the original sin is "name stealing." This can be interpreted in many ways but essentially they believed that the biggest sin, the most harm one can cause to oneself or to others, is telling a lie. This is the deepest alteration of language itself.[1259]

Doublespeak, the twisting or reversing of the meaning of words, is perhaps the modern equivalent of name stealing.

Name stealing and excuses for forgiveness go hand-in-hand. In order to go about their name stealing, Hebrew elites required a god of forgiveness who could grant them excuses when they feigned ignorance, in the case they were caught going about their sins. "I didn't know" is only a valid excuse when it comes to knowledge of human wants and desires, but does not extend to knowing about facts of Nature. Nonetheless, "I didn't know" is affirmed culturally as grounds for being excused, and this has foundations in Judaism. The god of *The Bible* is the god of ignorance as well as forgiveness, and so, also, excuses. He punished Adam and Eve for having eaten the fruit of knowledge, and thereby losing their plausible deniability. Before this, there was no sin, because it could all be denied by way of innocence, which is ignorance.[1260] When one is ignorant, in our Judaic culture, one is often forgiven, and so, under these conditions, knowledge becomes a liability, a loss of the power of one's excuses, a loss of the power to name steal.

Name stealing had perhaps been one of the chief distinguishers of the Jews from the rest of the Israelites early on, owing to the history of the Jews' captivity in Babylon, home to the Tower of Babel wherein the languages of man are said, in *The Bible*, to have been scrambled up. Rabbinical Judaism, descending from the Pharisees whom Jesus opposed, and of the sort that Ashkenazi (German) and

---

[1256] Clif High suggested in the video that the codex was hundreds of years old at least, not that it was thousands of years old

[1260] For instance, during the planned Coronavirus epidemic, the orchestrators feigned ignorance about knowledge of the consequences of their actions

Sephardic (Spanish) Jews adhere, follows the Babylonian *Talmud*. Of the Rabbinical Jews, Jesus Christ is understood by many far-Right white supremacists to have told, in one of his parables, of the *tares* among the wheat, weeds that would grow among the wheat, and the proper way to deal with them, which was not to pluck them from the ground, thereby harming also the wheat, but by allowing them to grow tall, standing above the wheat, and only then, when they appear for all to see, to cut off their heads, to bundle them up, and to burn them. According to the white supremacists, this was about the Jews hiding among the rest of the white people, pointing to common origins of the words *white* and *wheat* to make their claim. The word *wheat* in Indo-European may in fact be derived from the word from which *saka* came, **saca*.[1261]

Certainly, the WASP elites are not much better than Danish and Norman Jutish conquerors who had followed them in their own conquest over the Britons, the Scottish, Swiss, and other Celtic-Germanic banking practices often rivaling those of the Jews. While the ethnic ingroupness may also be something of a concern, the main issue is not ethnic, but political and economic. In particular, it has to do with political and economic class, where, at the bottom of the hierarchy, can be found both Anglo-Saxon and Jute. We must, therefor, distinguish between ruling class and abiding class among these groups, even if we concern ourselves as well with ruling races or ethnicities which maintain a clear and established in-group instinct. J.R.R. Tolkien proposed the idea that Jutes had gotten the Frisians and Danes into conflict in his "Jutes-on-both-sides" theory. It is important not to get too caught up in ethnic identity, or it may be used to divide and rule. It is more important to concern oneself with class.

Importantly, this plays into matters of today. The upper class needs the lower and middle classes to quibble with one another and, especially, when quibbling, to establish terms of engagement such as the need for the use of *credible sources*, sources that have some kind of title of nobility attached to their name, perhaps, such as *Dr.* or *Ph.D.* or *President* or *CEO*. So long as the Anglo-Saxon side and the Jewish side quibble on official grounds, agreeing to call the boundary when a working class or otherwise unofficial source is used, the ruling class as a whole, Anglo-Saxon *and* Jewish—the Great White Brotherhood—, wins. It is for this reason that universities and colleges teach students to only cite credible sources, typically including demands that they also be recent sources. They don't care about the content as long as the credentialed are referenced and the date is recent. That way, they can change the goalposts if need be. Also, things are much easier if there remain only two goalposts to keep score on, the side of Cain and the side of Seth, ever straddling the body of Abel. Hating either side only strengthens them. What is needed in the world, then, is, much as Jesus said, love.

Feudalism

The state has tended to be a civilizing though collectivist encroachment from the East, coming from Sumeria, Babylon, Egypt (the Egyptian state has an Eastern source), India, Tibet, China, and probably the Pacific islands.[1262] The West has always been a defense against the advance of Eastern collectivism, a defense that is simultaneously losing ground while also culturally weakening the rule of Eastern powers. The justification of the Western state, since the Fall of Rome especially, has primarily been defensive in

[1261] In the Parable of the Tares, it is commonly understood that the tares were weeds that hid themselves among the wheat by looking much the same, often said to be an analogy of unwanted elements hiding among the Indo-Europeans, considered to be false white people, Rabbinical Jews. Indeed, Jews were said by Jeremiah not to "even blush." The proto-Uralic **wete* borrows from Indo-European for what may have replaced **saca*, suggesting that there was a certain relationship seen between the whiteness of wheat and its symbol for what would become white Nordid people, the Saka.

[1262] China is the longest lasting, most contiguous country to have persisted from ancient times

nature.[1263] Feudal lords ruled on the basis of providing protection. From whom? The East (their cousins), particularly steppe peoples such as the Huns, Mongols, Tartars, Ottomans, etc. and also Near-Eastern Muslims and those of the Far East. That this protection is actually provided by those affiliated with the East is another matter, because the premise is accepted.[1264] Eastern influence would manipulate the nature of native Western authority figures— as are found in lawspeakers, war chiefs, and early kings of Celtic and Germanic peoples—, however, such that they would become kings and emperors themselves, as would be found in Babylon and would develop in Rome and France. Michael Cheilik says that monarchy "probably originated as a temporary expedient at times of emergency, with the king elected by the assembly."[1265] Nonetheless, as a whole, and in comparison to the East, especially China, Western society is also characterized by its tendency to break things down, owing in part to its *Nastika* philosophical and religious tendencies inherited from Southern Asian immigrants.

During the rise of the Greek and Roman Empires, centralized control of the Greek and Italic sort was practiced, but after the Fall of Rome, and the breaking down of the Dark Ages, and Rome's division into the West and East, much of the Germanic and Celtic ways of governance had been partially restored. The result was a society based around monarchy and feudal households, involving much war and conquest for power. Under monarchy, developing from corrupted war chiefs, a king or queen, or someone with a similar title, would be given the exclusive right to govern over a given country, sometimes with limitations imposed by that country's aristocracy or nobility. The Celtic and Germanic peoples were some of the last to form actual empires in Europe, though it is possible to speak of a widespread proto-Celtic and Thracian culture, from which the Germanics would be derived. Rather, it was maritime peoples such as the Phoenicians, Greeks, Romans, and others who formed the first true empires of Europe.

The Frankish Empire was developed by the Franks— a Gallo-Romantic-admixed Germanic people from the Rhinelands that likely had some admixture from or were derivative of Radhanite Jews as well[1266]— under Clovis. It was perhaps the first true empire of the Celtic-Germanic peoples (though Indo-Europeans such as the Hittites and Phrygians had formed empires long ago more Easterly). The Catholic Church had influenced Jutish, Frankish, and now Norman tendencies in Northwestern Europe against the Anglo-Saxons, Scots, and Britons, spreading Christianity and feudalism into England thereby (and also into traditional Germanic lands). Clovis, a convert to Christianity, had defeated the Romans and established the Frankish Empire, but new incarnations of the Roman Empire would continue to persist as the Carolingian, established by Pepin gave way to the Holy Roman Empire under Charlemagne, after the alliance was formed with Rome, where the Catholic Church was still centered. One excuse for the creation of Gallo-Romantic and Germanic empires such as those of the Frankish and the Holy Roman empires was the incoming pressures from the East, as from the Huns, Mongols, and Turks, which had already pressured the barbarian tribes, Celts and Germanics included, to topple

[1263] Paleoconservatives— who are closest to the root impulse of government— are also primarily concerned with defense against outsiders, in defending against external threats, as are coming primarily from the East in the form of collectivism, and which have been fairly nativized in Southern and Northern European culture (Western Europe and America are more resistant). Conservatives are more okay with authority because that authority is seen to be acting on behalf of an "in group" working to prevent damage created by some kind of outsider. Because the focus of authority is on the outsider, the authority is deemed to be less of a threat and more of a teammate (as is the case with figures such as war chiefs).

[1264] Or, at least, it was. It's becoming more clear to the mainstream American that our politicians work for the East. Rulers in Europe had been collaborating with the East since the Renaissance. Accepting representatives of Eastern (really, globalist now, not Eastern) interests for both candidate options is not something people are staying interested in.

[1265] Cheilik, 14

[1266] Franks and Radhanites appear in the Rhine River area around the same time in history

Rome-proper. The Huns, a decentralized steppe people, and more specifically the Xiongu, had likely been pressured themselves into invading Europe— wherein they established dominance over Goths and others— by the Han Dynasty of China, their cousins.

Especially after the Papal Revolution of Gregorian reform, it would establish itself as distinct and above the authority of secular government, such as that of the nobility and of the Holy Roman Empire, by now as much Celtic, French, and German as Italian, at large. In many cases, the Church maintained a great deal of authority over governments going into the feudal age. In reaction to this, secular authorities banded together and produced their own laws. Legal scholar, Harold J. Berman, says in his *Law and Revolution*, that, at this time, "a fundamental change took place in Western Europe in the very nature of law both as a political institution and as an intellectual concept." He says that "there emerged for the first time strong central authorities, both ecclesiastical and secular, whose control reached down, through delegated officials, from the center to the localities."[1267] He says that Gregory had established

> the legal supremacy of the pope over all Christians and the legal supremacy of the clergy, under the pope, over all secular authorities. Popes, he said, could depose emperors—and he proceeded to depose Emperor Henry IV. Moreover, Gregory proclaimed that all bishops were to be appointed by the pope and were to be subordinate ultimately to him and not to secular authority.[1268]

Quite the revolution. And the impact was monumental. Berman says that the "Papal Revolution" meant that the "king was no longer the supreme head of the church," and that the "era of 'sacral kingship' gradually came to an end."[1269]

Despite the control and corruption of the Catholic Church, the rise of Christianity is often associated with the decline and eventual abolition of slavery, similar to how later Protestantism is associated with the end of serfdom, or prior Judaism was associated with the end of traditional Canaanite human sacrifice (which ended with Isaac by way of Abraham[1270]). Christianity brought a new moral standard with it, which was established upon notions of brotherhood, notions that would be passed into fraternities and guilds of the coming years.[1271]

Landlordism comes from political power, and in the Medieval Ages it took the form of allodial title, feudalism, and manorialism. Before feudalism, landlordism was established by way of allodial title, a title not dependent on feudal obligations but held privately and in perpetuity. Only a sale could remove one from claim to this title. However, "folkland" would eventually lose its allodial nature and would be taxed, while "bookland" was originally developed to give charter and privileges to churches. Giving up one's allodial claim for bookland became an immediate advantage, one that might even be envied. Around the same general time as the Gregorian reforms, feudalism was being spread by the Normans. It was through the development of feudal obligations by territorial lords, and by being indebted, that allodial titles were broken down and feudalism-proper was established. *Feudalism* has been defined in *Duhaime's Legal Dictionary* as "the social structure of Western Europe in the Middle Ages." It says

[1268] Berman, 94
[1269] Berman, 403
[1270] Hebrew Abraham was going to sacrifice his son, Isaac, but relented when stopped by an angel, instead sacrificing an animal. This put an end to the Canaanite practice of child sacrifice among the Hebrews. Christianity would bring about the end of child sacrifice.
[1271] Among the nobility, these notions would be most strongly expressed in the military orders, such as the Order of the Knights Templar, who had been exposed to mysteries from the Near East, and had begun to establish "states within states." The *bourgeoisie* would develop fraternities and guilds of their own, as well.

further that feudalism "had for its central core the relationship of lord and vassal (not then a word of shame) bound together by a bond of personal loyalty and owing mutual aid and assistance."[1272,1273] Henry George describes feudalism quite well:

> After the Roman Empire fell, the idea of common rights was blended with the idea of exclusive property. The feudal system was the result.
>
> But side by side and underneath the feudal system, a more primitive organization revived. Based on the common rights of cultivators, it has left traces all over Europe, and still survives in many places.
>
> Feudalism clearly recognized — in theory at least — that land belongs to society at large, not to the individual. A fief (a feudal estate) was essentially a trust to which certain obligations attached. The sovereign was, theoretically, the representative of the collective power and rights of the whole people. Though land was granted to individual possession, specific duties were required. Through these, some equivalent to the benefits received from the common right was rendered back to the commonwealth.
>
> Under the feudal scheme, crown lands supported public expenditures. Church lands defrayed the cost of public worship and instruction, as well as care for the sick and destitute. The military tenant was under obligation to raise a certain force when needed.
>
> These duties were a rude and inefficient recognition — but unquestionably still a recognition — of a fact obvious to the natural perceptions of all men: Land is not individual property, but common property.
>
> Amid the feudal system there were communities who tilled the soil as common property, though subject to feudal dues. Of course the lords, if they had the power, claimed pretty much all they thought worth claiming. Yet the idea of common right was strong enough to attach itself, by custom, to a considerable part of the land.[1274]

The semi-revival of traditional Germanic and Celtic society entailed that feudalism evolved as a combination of barbarian common law and Roman civil law, mixing elements of the commons with private ownership or control by the king (in the name of the common interest). While Roman society was a slave-based society, organized largely through the *latifundium* (large private estates or villas), the feudalism after its fall was based more on serfdom. Many of the radical and heretical Christians would come to attack feudalism on the grounds that land was a common inheritance from God. Feudalism would be a change whereby the allodial title to the entire realm was held by the king, often a compromised Gothi. Kings either had allodial rights in all of the land, or were otherwise understood to be executives of the people, holding the land as their trustee. Historians Patricia S. Daniels and Stephen G. Hyslop, in their *Almanac of World History*, note that feudalism was a system "in which land was parceled out in exchange for services as well as the payment of rent." They say that it "was a class system," and that the "status that a person held in society depended in large part on the amount of land he controlled," and that at the "top was the king, who granted land to nobles in exchange for their support," while at "the bottom were the peasants who worked the land for masters." Its "roots lay in the policies of rulers such as Charlemagne, who sought the support of powerful nobles by granting them

[1272] Duhaime Legal Dictionary

[1273] Notice that, here again, just as with the origin of government, we see mutual aid—on behalf of a victor— to be the culprit for centralized control. The power of governments ultimately has its roots in mutualism, which, in the hands of the working class, will also be their undoing. Government is but mutualism, partially accomplished.

[1274] George

large estates." In turn, the "nobles tried to guard their property and the king's realm by dolling out parcels of land to lesser lords—vassals—who served as knights in time of conflict." Then the "lesser lords in turn contracted peasants to work their land, growing rich from tolls, taxes, and produce generated from the labor of their serfs." They say that fundamental "to the feudal system were the manor houses of the major nobles, located in militarily defensible positions and garrisoned with professional troops for protection."[1275] Thomas Jefferson tells us that

> In the earlier ages of the Saxon settlement, feudal holdings were certainly altogether unknown; and very few, if any, had been introduced at the time of the Norman conquest.
>
> Our Saxon ancestors held their lands, as they did their personal property, in absolute dominion, disencumbered with any superior, answering nearly to the nature of those possessions, which the feudalists term allodial.
>
> William, the Norman, first introduced that system [feudalism] generally.
>
> [...]
>
> But, still much was left in the hands of his Saxon subjects; held of no superior, and not subject to feudal conditions.
>
> [...]
>
> Feudal holdings were therefore exceptions out of the Saxon laws of possession, under which all lands were held in absolute right. These, therefore, still form the basis, or groundwork, of the common law, to prevail wheresoever the exceptions have not taken place.

Feudalism did exist in some parts of England before the Norman conquest as a part of Roman *latifundia* influence,[1276] but had generally been eradicated by the Anglo-Saxons. What Thomas Jefferson is saying is generally correct. Even the nobility did not always sufficiently organize to protect their interests. Feudalism had entered England as part of the "Norman yoke." Normans also further forced Christianity onto the Saxons. The mechanism of spread of the Norman yoke seems to have been largely by way of Jutish warfare—the Right of Conquest— and usury, feudalism resulting from obligations of surrender and from defaults on debts. Jews who were in conflict with Christians were protected by the laws of the royals. In England, Jews were considered to be "royal serfs," and were given protection in the Norman castles, freedom of travel without toll, a trial by their peers, were granted land directly from the king, and were given other permissions, including the ability to practice usury with Christians. A Jew's oath was as good as the oath of twelve Christians. Some Jews might serve as men-at-arms. Further, in Norman England, William the Conquerer wanted taxes paid in coin rather than in kind, and this would become standardized, giving priority to coin and allowing for seigniorage to be extracted by the King's mints. This also made the economy more dependent on usury. Jews were heavily taxed, but as a corporate body, not as individuals. Nonetheless, their prosperity, their affinity for professions such as usury, tax collecting, executing, and etc., made Jews prone to attack by jealous or offended commoners and indebted nobles. They would increasingly be blamed for blood libel, witchcraft, poisoning wells, and human sacrifice throughout Europe. Eventually, Jews would be expelled from England.

[1275] Daniels and Hyslop, 128

[1276] Romans and Anglo-Saxons had enslaved Britons, who were Cro-Magnoid, Mediterranoid, and Alpinid Celtic peoples. Roman *latifundia* both made use of slaves (not serfs) and were feudal in nature.

Peasants had to work the fields and share their product with the Church and State through tithes and taxes, rents, or *corvée* labor, keeping only a portion of their efforts for themselves. Eric R. Wolf points out, in *Peasants*, that the distinguishing feature between peasants and primitives, such as horticulturalists, is that peasants do not own their means of production, whereas a primitive does. He says that

> in primitive society, producers control the means of production, including their own labor, and exchange their own labor and its products for the culturally defined equivalent goods and services of others. In the course of evolution, however, such simple systems have been superceded by others in which control of the means of production, including the disposition of human labor, passes from the hands of the primary producers into the hands of groups that do not carry on the productive process themselves, but assume instead special executive and administrative functions, backed by the use of force. The constitution of society in such a case is no longer based on the equivalent or direct exchanges of goods and services between one group and another; rather, goods and services are first furnished to a center and only later redirected. In primitive societies, surpluses are exchanged directly among groups or members of groups; peasants, however, are rural cultivators whose surpluses are transferred to a dominant group of rulers that uses the surpluses both to underwrite its own standard of living and to distribute the remainder to groups in society that do not farm but must be fed for their specific goods and services in turn.[1277]

While some peasants might have been free smallholders, serfs did not control the land that they occupied and used; instead, it was understood to belong to the Church or the nobility. *Serfs* were peasants who were tied to the land of their lord, and could not legally move from it. *Serfdom* was their condition under feudalism. Berman suggests that "peasants, often called serfs, were distinguished by several characteristics." He notes that they fed and clothed themselves and could marry, had rights to their possessions but limited rights to the land, but that they were bound to the land, and had to perform labor for the lord, had to pay rent.[1278]

Due to the collection of nearly all economic surpluses by the lords of the land, peasants themselves maintained a largely Stone or Bronze Age standard of living and quality of life up to modern times. Almost all of the wealth that they created went to afford the ruling class its luxuries, its wars, its travels, its leisure, and its property, though some of that property was for use by the commoners. Bakers were expected to bake bread, and peasants to grow wheat, for instance, on this property. Though the peasants had created the great abundance of material and economic good enjoyed by the ruling class—standing as the representative of society as a whole—, they themselves continued to live basically as Stone Age or Bronze Age people, in so far as their wealth was considered. The reason for this is that the peasants had never established the sort of social organization necessary to coordinate their own group power. Thus, they succumbed to the power of the nobility, who did organize themselves. While the nobles had successfully produced mutual aid societies in the form of tribes and ruling families, peasant organization was still largely along the lines of band and clan society. This makes sense, considering that early peasants were largely composed of conquered peoples, many of whom may have had been Alpines of hunter-gatherer, herder, fisher, or especially of simple horticultural origin, and had not themselves culturally evolved clan organization to the same extent. Peasants had come from the producing societies of the Neolithic, and owed their peasant status to their ancestors having been conquered and forced into slavery or serfdom. But the rulers also ensured that clan organization would

[1277] Wolf, 4
[1278] Berman, 316

not form between peasants through religious restrictions on the mysteries and on free association. Nonetheless, peasants were prone to revolt, and they would do so in favor of their preferred pagan folk religions, in opposition to the clergy, or in opposition to feudalism and foreign conquerors or high taxes, among numerous other reasons.

Feudalism had been the common practice throughout Europe, and wherever agriculture was practiced something similar could be expected. Under feudalism, the economy that accompanied monarchy, the land belonged to the Crown and was under the authority of a given monarch, who would grant the right to govern over portions of the land—a fiefdom or manor—, by way of a fief (contract), to a vassal, or a nobleman, who collected rents in the form of taxes. This vassal was understood to be the chief tenant, having other tenants under him. As tenants-in-chief, the nobles granted land rights to lesser nobles, gentrymen, and (depending on the exact system in place) to some of the artisans, burghers, or free peasants. Many fiefs had manor houses and ultimately ran like miniature feudal systems of their own. Berman has interesting commentary on this. He says that, similar to the fealty between lord and vassal, that "the manorial law of lord-peasant relations and agricultural production came to form a legal system," and that feudalism and manorialism were "closely related to each other." He says that "there were large numbers of peasant family households that were free, in the sense that they were not tilling the soil of a superior (except sometimes as hired laborers) and were not bound in personal service to a superior." However, he suggests that "slavery also abounded in European agriculture," and that "these slaves were either descendents of persons captured in battle [...] or they had themselves been captured in the more or less continual warfare that was waged in Europe." Still more were "descendents of persons who had been slaves in the late Roman Empire." He reminds us that "the Western word 'slave' (in German, *sklave*) derives from this historical experience" of the Slavs. "'Frank,'" he says, "in contrast, came to mean 'free.'"[1279]

The land-owning class of privileged nobles in their manor houses and castles was distinct from the commoners, who often merely had access to the use of common lands, rarely becoming yeomen and having much land of their own. Some of the lesser classes did eventually acquire property, but not to the extent of the upper gentry or nobility. The nobility included those with hereditary titles, and included lesser lords and knights, the gentry was composed of non-nobles who had coats of arms, and the other common people included artisans, merchants, and others such as yeoman, free peasants, and those in serfdom. The nobility would often live behind the protection of castle walls, sometimes themselves in or adjacent to towns or *burghs*. Some of the middle class commoners, including well-to-do artisans and merchants, would live within the walls of the burgh, and would come to be known as *burghers*, or, later, the *bourgeoisie*. Peasants lived outside of the city walls. Nolan and Lenski point out that the family

> was usually *the basic unit of economic organization*. Businesses were almost always family enterprises; the corporate form of enterprise, owned jointly by unrelated persons, was virtually unheard of, even in the largest cities. And in rural areas the peasant family was the basic work unit.[1280]

Nobility came with certain customs and moral obligations, which were attached to sentiments of chivalry in the king's court, fealty to one's lord, and a sense of noble obligation toward those of lower social rank. Chivalry was a code of conduct and an honor system that regulated behavior associated with fealty and nobility, and that reinforced courtly manners, knightly piety, and good etiquette. Nobles were expected to behave well in the court of the king, and to be courteous toward others. Fealty was an obligation not only between nobles and the king, but also between lesser and greater nobles, or any

[1279] Berman, 316
[1280] Nolan and Lenski, 165

vassal to a lord, having sworn allegiance and fidelity to one's lord. The obligations of nobility, or *noblesse oblige*, included an expectation to be responsible toward those one ruled over, as by being generous, just, and a good example to them. The idea was that the privileges of nobility had to be balanced through moral behavior.[1281]

Although the nobles— over time, this would especially be people of the Nordic race, such as Germanics— had wrestled power away from the rulers of classical antiquity (Mediterranoids), they had over the years allowed their grip to slip into the hands of a small number among them, which would be known as *royalty* (Jews). This was essentially a ruling clan among ruling clans. So, while the commoners were prone to revolts, they weren't alone in revolting. Rebellious nobles, too, would end up revolting. Eventually, the absolutism of Norman King John in England would be limited by a charter on him called the *Magna Carta*. The Magna Carta, while it wasn't the first control on the King by the other nobles, was among the most significant in limiting the King's powers, putting restrictions on his power of taxation, except when approved by a council. This council would be known as *Parliament*, and was an example of an early constitutional and democratic influence on the King. English liberals, republicans, and radicals would pressure for more democratic influence through parliament, and more limitations on the King's powers.

In Poland, the nobility did not practice feudalism at all, and for a long time remained without a king, but instead maintained a form of landlordism similar to the old Germanic system, based on allodial title. As such, nobility in Poland was much different than in other areas. Another reason this was so is that the Polish nobility understood themselves to be the direct descendents of Japheth, the son of Noah, and believed themselves to be the rulers over Hamite peasants, with Biblical justification. Jews were prevalent in Poland, too, as shopkeepers and merchants and such, understood to be the offspring of Shem. The Japhethite Polish nobility— aware of their Aryan background, but also having a fair input of Scythian and Rus, being related to the German nobility, despite their being technically Slavic—claimed the land in a collective monopoly of private landlords. Eventually, this nobility would establish political control, subjecting the elected monarchy to their demands in a way somewhat similar to the parliamentarian movement coming from out of the Magna Carta in England, but instead working to establish the *Golden Liberty*, a democracy of Polish nobles having power of election and veto over the King. This was driven by their ideology of *Sarmatianism* or *Sarmatism*, the belief that they are the Sarmatians.

The ruling class had at first been an exemplary hybridizing force, but since conquering the world its class-inbreeding practices—exemplified by the *Hapsburg Jaw*, an underbite from being inbred— have become problematic: all ruling classes of Europe and likely beyond are more-or-less related familially now, and the whole planet is conquered by this same Great White Brotherhood. This problem became especially noticeable come the modern era, and was frequently discussed, because the people of Europe, and especially the upper classes, had been strongly inbred and suffered from a larger number of problems, among them neurological problems. This was less of an issue when people had been

[1281] *Noblesse oblige* is said by some anthropologists and sociologists to be making a comeback in contemporary society, especially by way of the techno-managerial or professional-managerial classes and their *political correctness*, controls on the kinds of things that can be said. This is apparently an attempt to establish a new nobility, wherein the noble thing to do, the thing that protects one's privilege to do, is to stand up for the *officially oppressed*, people who are said by institutions to be "oppressed" by nature of society's reaction to their skin color, sex, gender self-identity, or etc. Recognizing "official oppression" often comes at the expense of *class consciousness*, awareness of the role that economic class has to play in oppression, or otherwise downplays this role as one factor in with the rest. The truth of the matter is that *selection* is not oppression, and that favoritism is not oppression, but that class (not "classism") is *always* oppression, and is the only legitimate, material claim of oppression.

migrating, because nobles such as the Scythians—who might have a large harem of women, practicing polygamy— were, as a culture, highly nomadic and migratory, and, along their route, such as along the Jat Belt, they assimilated a large range of genes. As rulers, especially as royals and nobles, who were tied to a particular area and had to practice moiety-like arrangements with select people, this was not so much the case.

The peasantry, who would become today's workers, on the other hand, do not draw from a particular race or family, and so do not suffer from the effects of inbreeding to such an extent, though their agency is limited. While the Scythians had been going around establishing themselves as a ruling class across the face of the Earth, the lower class was being maintained as a hybrid zone. Peasants, themselves Alpinids having been mixed with Neanderthal and having many Cro-Magnoid genetics, often had few qualms with accepting genetics from other peoples, and any hesitance to doing so might be overruled by *ius primae noctis*, the "right of first night," anyway, as well as by rape by noblemen and royals outside of that first night.[1282] Peasants, more than anyone else, were likely to "mongrelize," having little at stake in regard to their family honor or inherited status. Rulers had to marry into noble or royal families in order to keep up their status. This did not always occur, however, as some nobles would be struck by the beauty of a common woman, choosing to sire children who would not be considered fully noble-born, though they may have joined the gentry or become freemen. As such, the peasantry in Europe came to be composed of especially Cro-Magnoid (Brunn and Burreby phenotypes are an example), Alpinid, and déclassé Mediterranoids and Nordids, who tended more and more toward mongrelization. This has contributed to a great deal of hybrid vigor among the working people of the world, whose genetics have also been put through the harshest tests of natural and artificial selection. Acknowledgement of this issue by the ruling class has led to child-trafficking, designer breeding programs, and genetic manipulation. Georgian peasant women, in the Caucasus where hybridization has especially been the rule, were seen as particularly beautiful and were often enslaved and added into the harems of sultans and other rulers (perhaps an early solution to the problem of inbreeding that was not taken up—at least so outwardly— by Europeans, Christianity tending to demand monogamy and nobility typically demanding endogamy relations).

The Age of Aristocratic and Noble Mutualism

The Age of Aristocratic and Noble Mutualism, as I call it, was the era in which the nobility of pagan and Christian feudal society, the clergy, and the aristocrats of classical antiquity, had established, inherited, and retained power. Originating in the kin structure of the clan— a mutual aid society— and growing to the size of empires, before devolving back into medieval kingdoms, aristocratic and noble mutualism would last from the late horticultural era to that of advanced agriculture. During this time, the nobles, aristocrats, and royals maintained a monopoly on the most important economic resource— land—, which, as the dominant factor of production, defined the modes of production known as *slavery* and *feudalism*.

Without mutual aid, the nobles and aristocrats could not have gotten an upper-hand over those they conquered, could not have retained their power so long, or passed it along as privilege to their heirs. They could not do this without some sort of conscious mutualism between them, and this mutualism would be expressed in the sophistication of the aristocrats and the chivalry of the nobility. Courtly manners and etiquette associated with sophistication and chivalry have often found themselves among an oligarchical ruling class of warriors and elders. And those with such etiquette have often dominated a

[1282] Today's workers, too, are opportunists when it comes to breeding. Indo-Eurafricanoids and Mongoloids and Negroids fairly regularly mix, especially in the United States today, creating Mestizos and Mulattos especially.

dissolute working population, from whom they have extracted an economic surplus. Should this working population have had established mutual aid amongst itself, it would never have had faced its plight as serfs. But mutual aid will always be dominant over atomistic individualism or sentimental collectivism.

We have now considered the mutualism of the upper class, which the rulers have always relied upon to establish and maintain power. Lower class mutualism, or proto-Mutualism, however, runs throughout the Radical Reformation and the Radical Enlightenment. The affects these lower class movements would have on the middle classes of pre-modern Europe [1283] —the lower gentry, yeoman, burghers, merchants, and wealthy artisans, for instance— were drastic. This influence of the lower class on the middle class would come to define genteel and *bourgeois* mutualism. We will now turn our focus to the mutualism of the commoners, particularly as expressed in heresies and radicalism, in peasant and worker movements and rebellions, and that of the middle class (of the Middle Ages) and their *bourgeois* and genteel republican revolutions, for which I have named the age.

[1283] It is well-documented that the Radical Reformation as well as the Radical Enlightenment came before their more mainstream variants.

THE AGE
OF
GENTEEL & BOURGEOIS MUTUALISM

Looking at the mutualism among heretics and radicals of the Radical Reformation and Radical Enlightenment, as well as that which became dominant among the burghers and lower gentry during their successes of the mainline Reformation and Enlightenment, ushering in the genteel and bourgeois variety of state

Medievel Communes

Monarchy and feudalism, while dominant, were not absolutes of the Middle Ages, just the norm. There were different forms of governments or organizational and economic arrangements, including allods, confederacies, and mercantile republics. Republicanism was particularly true of medieval communes and urban centers, but republics could also span a vast area, such as the Icelandic Commonwealth, the Novgorod Republic and the Hanseatic League, or the Swiss Confederacy. Often, though, they would be more localized, such as in the republics of the Italian papal or city-states, including the republics of Venice and of Genoa. Peter Kropotkin says that

> there is positive evidence of a federation of seventeen peasant villages which has existed in the Laonnais for nearly a hundred years [...] and has fought hard for its independence. Three more peasant republics [...] existed in the neighbourhood of Laon, and, their territories being contiguous, they supported each other in their liberation wars.[1284]

These peasant villages were part of a larger struggle for republican and communal living. Rudolf Rocker says that

> After the downfall of the Roman Empire there arose almost everywhere in Europe barbaric states which filled the countries with murder and rapine and wrecked all the foundations of culture. That European humanity at that time was not totally submerged in the slough of utter barbarism, was owing to that powerful revolutionary movement which spread with astonishing uniformity over all parts of the continent and is known to history as "the revolt of the communities." Everywhere men rebelled against the tyranny of the nobles, the bishops, and governmental authority and fought with armed hands for the local independence of their communities and a readjustment of the conditions of their social life.
>
> In this manner the victorious communities won their "charters" and created their city constitutions in which the new legal status found expression. But even where the communities were not strong enough to achieve full independence they forced the ruling power to far-reaching concessions. Thus evolved from the tenth to the fifteenth century that great epoch of the free cities and of federalism whereby European culture was preserved from total submersion and the political influence of the arising royalty was for a long time confined to the non-urban country. The medieval commune was one of those constructive social systems.[1285]

In many republican city-states or communes, the guild system prevailed, often reflecting republican governance, and the textile industry, in particular,— which would become the most saturated with heretics, radicals, and Mutualists— was a major component of the economy. Johannes Althusius, one of

---

[1284] Kropotkin, 206
[1285] Rocker[1]

the founding thinkers in the concept of federalism believed that natural law gave citizens the right to resist tyrannical government, that sovereignty rested with the community, not the ruler, and that legitimate political authority was founded on local communities. He lived in Westphalia, which had been controlled by Saxons.

Unlike the feudal order, in which commoners expected protection from the nobility in the case of raids or invasion, a commune would rely upon the mutual defense of its members, who would swear an oath to help with such a cause. In such communes, democratic or republican forms of governance were often practiced. Many communes began in walled cities that had been left over from the times of the Romans, or that had been left after the death of a noble family and squatted. Peasants and other commoners, particularly guildsmen, merchants, and sometimes monastics, banded together to secure economic freedoms, such as the right to have a marketplace and join the guilds, to have religious freedoms, such as the freedom of conscience and the right to worship how they pleased, or political freedoms, such as the right to participate in elections.[1286] Rudolf Rocker holds this period in high esteem, saying that

> In that great period of federalism when social life was not yet fixed by abstract theory and everyone did what the necessity of the circumstances demanded of him, all countries were covered by a close net of fraternal associations, trade guilds, church parishes, county associations, city confederations, and countless other alliances arising from free agreement. As dictated by the necessities of the time they were changed or completely reconstructed, or even disappeared, to give place to wholly new leagues without having to await the initiative of a central power which guides and directs everything from above. The medieval community was in all fields of its rich social and vital activities arranged chiefly according to social, not governmental, considerations. This is the reason why the men of today, who from the cradle to the grave are continually subjected to the "ordering hand" of the state, find this epoch frequently quite incomprehensible. In fact, the federalistic arrangement of society of that epoch is distinguished from the later types of organization and the centralising tendencies arising with the development of the modern state, not only by the form of its purely technical organization, but principally by the mental attitudes of men, which found expression in social union.[1287]

However, many communes experienced problems of their own, and were themselves prone to revolt, as their representative democracies, easily influenced by economic monopolies to be found within or without the commune, tended to produce unfair results, and customs had not developed to get around this dilemma. Nonetheless, they were greatly preferred by their inhabitants, and served as an inspiration for rebellious peasants, guildsmen, and monastics around them. Harold J. Berman writes of the rise of urban centers in the same general timeframe that the Papal Revolution and manorialism came about. He says that the fundamental value of "urban law was its communitarian character." He says that it "was the law of a close-knit, integrated community—one that was often called, in fact, a 'commune.'" This commune was "based on a *covenant*, either express or implied," and often "cities and towns were founded by a solemn collective oath, or series of oaths, made by the entire citizenry to adhere to a charter that had been publicly read aloud to them." Berman says that the "charter was, in

---

[1286] Peasants tended to be a strange mix of common sense and superstition. They would act skeptical toward many of the claims of the ruling class, but nonetheless maintained superstitions from their time as tribal primitives, carrying over from shamanism and animism. While peasants are not primitives, in part because they are producers, they are nonetheless forced into a near-primitive quality of life by their rulers, whose taxes of their "surplus" (that above which is needed to barely stay alive to produce more for the ruler) keeps them from moving up in class or status. Like the primitives their lifestyles developed from and are so close to being lived like, the peasants maintained a mixture of superstition and common sense.

[1287] Rocker[1]

one sense, a social contract," and that "it must, indeed, have been one of the principal historical sources from which the modern contract theory of government emerged."

In this sense, practices from proto-Mutualism are responsible for social contract theory. That's quite the contribution to world society! Berman says that law was "not only of a covenantal relationship but also of a *participatory* relationship among the members." He says that this "was reflected in legal requirements of mutual aid among citizens and mutual protection against strangers and enemies," and that leadership had to seek the citizenry's "consenting to new laws," "consent to the elections of officials," to seek "adjudication by fellow citizens ('peers') of the person who claimed vindication of his rights or against whom a claim for vindication of rights had been made by another," use "a system of informal arbitration of civil disputes, lightly supervised by town authorities," and apply "strict regulation of economic activities through guilds of artisans and merchants."[1288]

Berman certainly describes a more democratic and fair society than what may have been common in Europe during the Middle Ages. Such democratic participation was usually reserved for councils of nobility, confederations, large republics, towns or communes, and for guilds halls and fraternities. But, unfortunately, the democratic element—the mutualism— was not always pure. Berman also suggests that "the covenantal aspect of the community should not be understood in terms of contemporary concepts of contract" or "contemporary concepts of democracy." Rather, he says, communal life was "usually governed by a relatively small group of participants," and so "urban law, while recognizing a certain equality of all citizens, rich and poor alike, *as citizens*, nevertheless did not generally permit the poor to participate in the election of leaders."[1289]

So, the communes, while harbingers of republican governance and free thinking, were also, most oftentimes, corrupted from the very beginning. This did not, however, stop them from having a positive impact, and, in fact, going on to influence the proto-Mutualists and Mutualists. To the contrary, the communes served as an inspiration to the guilds, who put republican governance to practice within their halls, and who would also influence the first industrial workers' rebellions, unions, and cooperatives.

One major problem that guilds would face at times was immigration. Immigrants such as the Gypsies, coming from out of Egyptian Jats (Zutts), therefrom deriving the name, would, at times, be allowed to immigrate so that they could scab on striking guilds.

Fraternalism

Early proto-Mutualism would express itself quite strongly through the fraternities and fraternal networks, including the chivalric orders, holy orders and monasteries, sodalities, friendly societies,[1290] and in the guilds and the guild system at large. Mutualism served nobles, clergy, gentrymen, merchant burghers, and artisans and peasants alike through these institutions and others like them. All of these forms of mutual aid associations, like the urban centers, had elements of merit and democracy at play. They tended to have grade-taking degree systems, wherein one may be expected to learn the principles

[1288] Berman, 393
[1289] Berman, 394
[1290] Friendly societies were associations that pooled resources. These resources could be used for financing purposes, or to provide insurance-like services during times of difficulty. For instance, members of a friendly society may assist in the construction of a new home, or they may assist in the burial of a loved one who has passed (a practice which may have come from a heretical sect called the *Lollards*).

and traditions, or *mysteries*, of the group before being allowed to take up an official position, which was oftentimes elected.

Holy orders were unions of nobles that had a religious or— what was believed to be a— benevolent cause, such as crusading or performing public acts of charity. Famous historical examples include the Teutonic knights, the Holy Order of the Knights Templar, and the Holy Order of the Knights Hospitaller (Knights of Malta), who waged war in the Crusades against Muslims, pagans, and Christian heretics. Another order rarely mentioned is the *Order of Saint Lazarus*, or the *Leper Brothers of Jerusalem*, sometimes considered a Hospitaller sub-order, which required its leaders to be lepers and maintained lepers among its ranks. Mutuality among these knights was kept up by way of ritualistic practice. Fraternities, however, might include the lower gentry and burgher classes, while many guilds were early mutual aid societies that functioned something like modern trade unions or cooperative associations. The fraternities and guilds often mimicked or emulated what they knew or perceived of the holy orders, which had begun forming "shadow governments."

Guild networks eventually composed an entire system called the *guild system*. They would practice Christian charity, work against the imposition of high rents, train workers in skilled craftsmanship, promote moral character development, maintain trade secrets, provide insurance, and facilitate other practices of mutual aid. Mechaniks of the artisans' guilds were some of the few people who were still well-versed in natural philosophy outside of the clergy and some merchants. Natural philosophy and mechanical engineering was preserved largely in the academies and in the guilds.[1291] Peter Kropotkin explains the guilds' origins thusly,

> The essential features of this organization remain the same wherever we may find them. It is a union of men carrying on the same profession or trade. This union, like the primitive clan, has its own gods and its own worship, always containing some mysteries, specific to each separate union; it considers all its members as *brothers and sisters*—possibly (at its beginnings) with all the consequences which such a relationship implied in the gens, or, at least, with ceremonies that indicated or symbolized the clan relations between brother and sister; and finally, all the obligations of mutual support which existed in the clan, exist in this union; namely, the exclusion of the very possibility before justice, and the obligation, in the case of a minor dispute, of bringing the matter before the judges, or rather the arbiters, of the guild brotherhood. The guild—one may say—is modeled upon the clan.
>
> [...]
>
> As to the idea and form of such an organization, its elements were already indicated from the savage period downwards. We know indeed that in the clans of all savages there are separate secret organizations of warriors, of witches, of young men, etc.—craft mysteries, in which knowledge concerning hunting or warfare is transmitted; in a word, "clubs," as Miklukho-Maclay described them. These "mysteries" were, in all probability, the prototypes of the future guilds.[1292]

This is just as Patrick Nolan and Gerhard Lenski had been saying earlier. Civilization arose from the mutual aid associations that are clans and secretive mystery religions, whose esoteric orders engaged in cryptic mythology-construction, exoteric religious indoctrination, and statecraft. These basic ideas have been kept alive in the mystery tradition, and went on to influence the communes and the guild system.

[1291] It was only during the later Scientific Revolution and the Enlightenment that trade secrets of the guilds started to get out, an effort to spread knowledge and break royal monopolies

[1292] Kropotkin, 323

Ultimately, statecraft and anarchist labor organization—often seen at odds— share roots in the original mutual aid association of the clan.

As with all clans and cults, order was maintained through rituals, rules, and qualifications. In the case of the communes and the guilds, enforcement was undergone mutually. Harold J. Berman tells us that

> Just as the urban commune often started as a sworn "conspiracy for peace," so within the commune the guilds are sworn brotherhoods whose members were bound by their oaths to protect and serve one another. The guild system of the [...] towns may have derived ultimately from the early Germanic guild, which had been a military and religious brotherhood [...] The later guilds also owed much to the Peace of God movement of the tenth and eleventh centuries, which operated in part through sworn brotherhoods, often called "peace guilds." These served as mutual protective associations and as volunteer law enforcement agencies.[1293]

Peter Kropotkin similarly speaks of the Germanic guilds as *frith guilds*, or guilds of friendship. Berman, continuing, says that "guilds, where they existed [...] were also lawmaking bodies." He says that "the various guilds [...] within a given city or town had its own ordinances" that differed depending on what was needed by the guild in question, but that the guilds had all been "fraternal associations" that had imposed

> obligations on their members to help their fellow members who were sick or disabled or poor or in legal trouble, to provide for burial of the dead and offerings for their souls, as well as to found schools for the children of their members, to build chapels, produce religious dramas, and provide occasions for hospitality and conviviality. The members periodically swore oaths of fraternity and pledged never to abandon the guild but to observe its statutes faithfully.[1294]

Both communes and guilds were voluntaristic and democratic associations established on the basis of mutual aid and cooperation. They would also, however, secure monopolies with the feudal monarchies over time, being given patents and the ability to restrict others from practicing in their industry, among other privileges. Daniels and Hyslop suggest that "merchants and craftsmen established guilds that set standards and rules for creating products and regulating trade." In the guilds, apprentices "could serve up to 12 years before becoming a master." The guilds were established to "deal with political superiors who charged heavy taxes," but, by right of privilege, could themselves become "monopolies that made it difficult for journeymen-craftsmen to become masters."[1295] Berman says that "guilds were also monopolistic economic associations" whose ordinances controlled many matters of daily and seasonal life, but that "slavery had been virtually abolished in the cities," and that "labor was based on contract; however, the terms of labor contracts were tightly regulated by guild and urban customs and ordinances on the basis of types of jobs (*officia*). To strike was a grave crime."[1296] Guilds, like other fraternities, started as fairly democratic associations, over which the members had much influence, but they were very meritocratic and regimented at the same time. Guildsmen, while participating in the overall democracy of early guilds, were also ranked according to their skill and experience. An *apprentice* was someone who was still learning, and would not be allowed to take up office positions. A *journeyman* was someone who had been trained, and was practicing, but who had not reached the level of master yet. A *master* would have finished their training, practiced on the job, and taken upon apprentices of their own. A master would be eligible for positions of authority in the guild, which were under the

[1293] Berman, 390
[1294] Berman, 391
[1295] Daniels and Hyslop, 151
[1296] Berman, 392

democratic authority of the guildsmen. Guilds had become the primary institution of craftsmen and artisans during the Middle Ages. Berman says that guild governance was often based on the "form of government of the city or town," and that its leadership might be composed of "two or more representatives, often called consuls, elected annually or sometimes semi-annually," and that a "general assembly of the guild with deliberative powers, as well as a small council to back up the consuls or other chief executives" maintained ultimate authority. The officers, who often were not allowed to participate in elections, "formed an arbitration tribunal before which the members were expected to appear before carrying their disputes into courts."[1297] The guilds would eventually come to influence the "political" economy of working class Mutualism, which, at least in the hearts of early Mutualists like Pierres Charnier and Proudhon, as well as many of the early (small *s*) socialists, harkened back to the time of the guilds.

Islamic Golden Age

The *Islamic Golden Age* was a period of increased intellectual activity in the Islamic World, wherein arts, mathematics, philosophy, and science would find new influence. Ja'afar Harun Al-Rashid[1298] is commonly cited as the originator of the Islamic Golden Age, which begins with his reign and his "House of Wisdom," wherein scholars were mandated to translate the world's knowledge for him. He had been born in Rey, once a Zoroastrian stronghold, which is considered to be the home of Radhanites, perhaps contributing to their name, and which means "red."[1299] Al-Rashid was an Abbassid Caliphate with connections to the Frankish Charlemenge, who had come from a one-time Buddhist lineage, the Barmakids. There is nothing too strange about this, as Radhanites had long occupied France.

Much of the Islamic Golden Age owed its existence to the rediscovery, spread, and original criticism of Greek philosophers— like Aristotle and Plato— and secular thinking by Islamic scholars and to the light-handedness of the rulers, among other things.[1300] Gnosticism was also influential in some respects. Aristotlean thought involved a natural theology that was based on logic, and this inspired critical thinking among the *illuminati* of the time. Neo-Platonism seemed to allow for a degree of otherworldliness to creep into reality, and gave heresy a mystical, yet still naturalistic, dimension. And gnosticism brought the Zoroastrian struggle of good and evil back to the forefront of conversation, resolving that evil was, for the most part, just ignorance or the accidental result of living in a material world. Some of the gnostics held that the Jewish god of the Old Testament was actually the demiurge of neo-Platonism, an evil or maligned diety.

Platonic forms, neo-Platonic emanationism, and Aristotlean peripatetic thought was brought back into fashion by way of Persian and Semitic philosophers such as Al-Kindi, Al-Farabi, Avicenna, Maimonides, and Averroes. Other Sufi and illuminationist thinkers such as Hasan Al-Basri, Mansur Al-Hallaj, Shahab Al-Din Suhrawardi, and Ibn Arabi also participated in the Golden Age. It's likely that Sufi thinkers along the lines of the pantheist Ibn Al-Arabi and Shahab Al-Din Suhrawardi would indirectly inspire heresies throughout Europe. Much of this— particularly that involving Al-Arabi and Suhrawardi and those to follow— may have been started off by a group called the *Brethren of Purity*, a kind of Sufic secret society known to have produced an encyclopedia called the *Epistles of the Brethren of Purity* and to have organized themselves into a guild-like hierarchy of four degrees, going from a first degree of Craftsman, to a second of Political Leader, to a third of King, and onto the fourth of Prophets and

[1297] Berman, 392

[1300] Among them interactions with India and Hindu scholars from the East

Philosophers, each limited by age. Demonstrating their eclecticism, they defined a perfect man to be the best qualities of Persians, Arabs, Babylonians, Greeks, Syrians, Indians, Hebrews, Christians, and Sufis. They were fond of the natural sciences, mathematics, and philosophy, as well as being studious in religious matters. The Brethren of Purity, in their *Encyclopedia of the Brethren of Purity*, says Muhammad Hamidullah in *The Emergence of Islam: Lectures on the Development of Islamic Worldview, Intellectual Tradition and Polity*, state that God created matter which developed into vapor and then water. Next, from that, developed minerals, which are themselves a form of life. Its highest form is choral, which is also the first stage of plant life, which culminates in the date plam, due to its having both sexes and dying if it is decapitated. This is also the first form of animal life. This develops eventually into an ape and then ape into human. At first, man is a barbarian, but he himself evolves into a saint and prophet, before becoming an angel. The process culminates in a return to Godhood.[1301]

It was Islamic, Persian Sufi mystic, Shahab Al-Din Suhrawardi's illuminationism, perhaps inspired by the Brethren of Purity to some extent, that would lend its name to the European Enlightenment. Illuminationism, or illuminism, was Suhrawardi's philosophy, which was also promoted by Mulla Sadra. While Suhrawardi's works were not directly read by Europeans during the Middle Ages, and while he was considered to be a heretic (and executed as such), his influence would spread throughout the Muslim world, particularly among Sufis, such as those who may have influenced heretical teachers. The illuminism that flowed from the Islamic Golden Age would go on to inspire the Enlightenment, so-called because of the illumination going on. Hossein Ziai, in the *Enclyclopaedia Iranica* article on "Illuminationism," says that it "was very popular [...] after the Mongol conquest that ushered in with it a new political era," and that it "was eagerly sought primarily due to its political doctrine, because of its potential use in formulating the theory of Mongol rule, lending it scientific and proven authority."[1302]

Suhrawardi had been a follower of Aristotlean peripatetic philosophy until he had had a mystical experience, at which point he had decidedly become a Platonist. The Illuminationists were not rejecting Aristotle outright, but were giving his work a deeper context. Like Thompson Gale, and in their "Illuminationist Philosophy," Ziai and Oliver Leaman write that it "challenges the Peripatetic position of the absolute, unchanging and universal validity of the truths discoverable by Aristotelian methodology," and that it "sets out instead to construct a system applicable to the whole continuum of being, including what is called 'immediate knowledge'."[1303] Rather than the empirical approach of Aristotle, Suhrawardi preferred raw intuition. According to the thought found in Islamic Illuminationism, some things are self-evident, or arise from intuition, and do not depend on logical rigor or on empirical investigation. One simply knows, through the super-sensory knowledge found in intuition, and, while considering one's prior knowledge, a sort of prophetic knowledge. Like a skeptical Pyhrronist, Suhrawardi argues, according to Gale, that "laws of science cannot be formulated as universal affirmative propositions (because of future contingency there may be always elements discovered that negate universality)."[1304] His Illuminationist philosophy retains much peripatetic influence, and rather than aiming to replace it, gives it something of a mystical background story. Suhrawardi believed that Aristotle's logic was largely correct, but that there was a missing element, that of mystical intuition or self-evidence, which Suhrawardi believed had to be the basis of logic.

A holist, Suhrawardi looked at Nature as a comprehensive whole, which was composed of varying degrees of immaterial monad-like light particles, which came in pairs, and were arranged hierarchically, reflecting their level of consciousness. Suhrawardi's rational-but-mystical system was that of a holistic,

[1301] See Hamidullah and Iqbal
[1302] Ziai[1]
[1303] Ziai[2] and Leaman
[1304] Gale

idealistic, emanationism. Ziai says that Suhrawardi "aims to refine and augment Avicenna's Peripatetic system and is careful that the Philosophy of Illumination does not decline to the position of 'handmaiden' of theology."[1305] Thompson Gale writes, in "Illuminationism," on *Encyclopedia.com*, that the "Illuminationists' daring philosophical position [...] was that peripatetic philosophy itself needs to be refined and reconstructed," and that the "Illuminationist legacy exemplifies refined rational process, and must not be confused with polemics to refute reason, nor to change reason to subjective, social, and ethical mysticism."[1306] Ziai and Leaman say that Enlightenment

> results not in knowledge of a fact or thing, but rather in a way of relating to God, a way which maintains one's status as part of the deity. One of the key aspects of Illuminationism is its disinclination to make a sharp distinction between God and that which God has produced. This is what has made Illuminationist philosophy seem so close to mysticism at times[1307]

Suhrawardi's philosophy contains a concept involving a hierarchy of paired lights, wherein light that was scattered was of a lower nature than that which was more concentrated at its source. This light was made of paired monads. At every layer of these monads, there was a degree of consciousness, with the highest level of consciousness found at the source of the light, in the Light of Lights. Thompson Gale says that this Light "illuminates everything," as, by way of self-consciousness, "every being comes to know its own degree of perfection, an act of self-knowledge that induces a desire (*shawq*) to 'see' the being just above it in perfection, and this act of 'seeing' triggers the process of illumination." Thompson says that by "the process of illumination, 'light' is propagated from its highest origin to the lowest elements."[1308]

Much like Suhrawardi, Ibn Al-Arabi, "Sultan of the Knowers," had been a famed and much-loved Sufi mystic. He is known to have had traveled the Muslim world. And much like Suhrawardi, Arabi had been a believer in a pantheistic emanationism. In "The Other as Mirror: Scriptural Reasoning and the Hermeneutics of Ibn Al-Arabi," Ahmed Afzaal says that for "Ibn Al-Arabi and his followers" that "there is only one Reality, one true Being, which is identical with Divine Essence," and that when one says that "there is no god but God," it "is to say that 'there is no real but the Real.'" Ahmed says that "God created the cosmos so that He could be known by His creatures; [...] however, these created 'others' have no existence of their own because there is only one true Being." He says that the existence of these "created beings" is "ambiguous at best, as they hang somewhere between Absolute Being and sheer nothingness," but that they "act as mirrors of/for God, making God 'known' by reflecting His attributes to each other and also back to God Himself." What has been described here is an emanationistic pantheism not entirely unlike Roman neo-Platonism or even Persian Zoroastrianism.[1309] Afzaal continues, saying, in the view of Al-Arabi, that "every event and entity in the created universe represents the self-disclosure of God through which God makes Himself 'known.'" He says that the "close relationship between the knowledge of self and the knowledge of God [...] implies that while every creature or phenomenon in the created cosmos reflects a limited configuration of a few attributes of God, the human being has the unique potential of reflecting all of God's attributes in their fullness,

[1305] Ziai[1]
[1306] Gale
[1307] Ziai[2] and Leaman
[1308] Gale
[1309] In neo-Platonism, *Being* is the *Source*, from which all come and to which all will return. In Zoroastrianism, Being is represented by the good god, Ahura Mazda, while nonbeing is represented by the evil god, Angra Manyu. This is a common theme found throughout many religions. It might also be compared to Empedocles's *Love* and *Strife*.

and thereby becoming the best possible mirrors of God through which He might become 'known.'"[1310] It's easy to see where notions in alchemy come from, the idea that a person may perfect themselves, as expressed in the metaphor of making a base metal into gold. This would entail a process of divinization, a mystical union with a God that one was never entirely separated from.

The pantheism of Sufis such as Ibn Al-Arabi is called, by Arkon Daraul, "*The Great Secret*," one that he suggests was reserved for the seventh degree of initiation into Ismaili secret societies (such as the Sufi). He says that the seventh degree of certain Ismaili Sufi orders "brought revelation of The Great Secret: that all of humanity and all creation were one and every single thing was a part of the whole, which included the creative and destructive power." Daraul suggests that "the individual could make use of the power which was ready to be awakened within him, and overcome those who knew nothing of the immense potential of the rest of humanity."[1311] It seems almost certain that this was the secret of Cain, the first symbolic murderer. But why would it be so important to keep this secret? Is it that society would really break down and everyone would start killing each other? This seems unlikely, considering the advancements the Islamic Golden Age would spread to Europe in the form of the Enlightenment later on. Would widespread enlightenment remove Cain of his advantage? Whatever the case, Cain's secret, in the hands of the Caliph—passed down from Mohammed—, gave him immense powers, powers he'd prefer to keep private. The Caliph, says Daraul, "was the embodiment of divinity, far more than any Tibetan lama ever was."[1312] Behind all religions and governments, behind all mortal pretenders, it seems, the truth of pantheism can be found lurking.

Ibn Kaldun would become an especially important Islamic historian and social and economic philosopher, often having his views on economics compared to those of Adam Smith, and sometimes being credited with the genesis of social science. He held that the state could have negative consequences in the economy, having formulated a theory of supply and demand and division of labor. He tended to believe that people in cities became immobilized and accustomed to luxury items, and so were easier to maintain control of, whereas pastoralists were accustomed to nomadism and harsh conditions, which made them accustomed to fighting back. Kaldun, a Muslim, had inherited much of his own culture from the nomadic Bedouin traders from which the Arabs are derived.

Islamic banking practices, in contrast to those of the Radhanites, are known to focus on usury-free banking.[1313] Perhaps owing to their proximity to the Radhanite traders or their readings of Greek philosophers (like Aristotle) and Christians (in general), Islam, in particular, would become particularly stringent about usury, forbidding any kind of *riba*, or interest, meaning generally "excess" or "increase." Nonetheless, modern Muslims have become quite lax about this, often hiding interest payments in substance as various different forms.

Heresy and liberalism (as well as radicalism) in medieval Europe was largely influenced by the Islamic Golden Age and the Muslim and Mongol Invasions, the latter of which would eventually put an end to the Islamic Golden Age.

Mongol and Arab Muslim invasions, and excursions along the Silk Road, exposed Europeans to many new modes of thinking that they may otherwise not have had. Joseph Campbell says that "[n]ot only

[1311] Daraul, 16

[1312] Daraul, 15

[1313] Judaism had also opposed interest among Jews (though Jews would often lend at interest to gentiles), and the Catholic Church would impose regulations against the practice of usury by Christians. Catholic regulation of usury only extended to Christians, however, and Jews were not obligated to uphold the Catholic faith, often lending at interest to Christians.

silk, but also ideas, were transported along that [Silk Road] route."[1314] Likewise, Daniels and Hyslop say that "[f]ar more than silk traveled the Silk Road, but the precious fabric was an important Chinese commodity." Religious ideas would especially be passed along on the Silk Road. They say, "Buddhism, Hinduism, and Christianity also traveled these routes," and that "[m]any Indian merchants were Buddhists and they spread their religion to the cities they visited [...] and on into China by the fifth century." Further, even the "infamous Black Plague [...] moved by trade routes from China to Europe."[1315] During this period of growing influence of Islamic power, Islamic ideas seem to have spread by way of the Silk Road, up through Spain by way of Muslim invasion, and during the Crusades, influencing much of Europe. The foreign new worldviews of the East seem to have influenced heretical and radical weavers of the Middle Ages to practice a great deal of what we now understand to be, or to have anticipated free thought and science: naturalism, alchemy, and enlightenment.

Sassanid and Ottoman Muslim conquerors are often associated with the millet system of personal law, wherein individuals of different religions followed the laws of their own religion within their own jurisdictions, and those of others in theirs. During the period of Muslim-ruled Spain, following the Golden Age of Judaism, a time known as *the Coexistence* or *la Conconvivencia*, "the Conviviality," occurred. This was a period of relative peace between the major Abrahamic religions, in which Jew, Muslim, and Christian shared much cultural influence with one another, translating each other's texts. Cordoba, Andalusia is often cited as a location of strong coexistence and conviviality.

The Proto-Reformation

Outside of Islam, early inspirations for heresy and sources of radicalism from the Ancient world included Hermetic or alchemical thought, as well as Gnosticism (such as the Cathars) and other forms of esoteric Near and Far Eastern religions, such as Hermeticism and Kabbalah, and the relatively more minor or indirect influences of Manichaenism, Mandaenism, Yazdaism, Mazdakism, Zoroastrianism, Hinduism, Buddhism, Taoism, etc. which traveled along the Silk Road, and which were brought into Europe alongside the indigenous, shamanic Mongol religion of Tengriism during their invasions Westward and by military orders returning from the Crusades. Gnosticism, Sufism, and Kabbalah represented the inner circles or esoteric varieties of the more exoteric Christianity, Islam, and Judaism,[1316] and religions such as Hermeticism, Zoroastrianism, Hinduism, Taoism, and Buddhism represented non-Abrahamic religious heresies that often informed the esotericists.[1317] Tantra (a word referencing weaving) provided an esoteric form to some of these. Influences such as these had done their parts to bring about the *Renaissance*, a time of humanism in arts and philosophy, which would influence what would become the Reformation, largely through merchant and craft guilds.[1318] Native European, medieval influences on heresy included pantheists who believed that the whole of Nature and God were ultimately the same, universalist theologians who believed in an eschatology (end of the world) in which every soul would be saved, apophatic theologians and mystics who approached God through negation and/or sought unity with God, unitarians who believed Jesus Christ to be a common man or something other than a member of the trinity, and millenarian theologians, who believed that the trinity showed that there was a new millennia coming, in which a fundamental transformation of

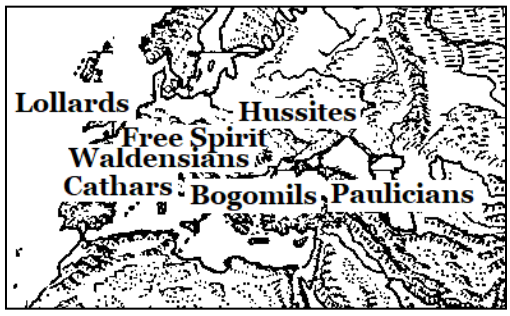
[1316] By *esoteric* I mean exclusive, hidden, or secret. Another word for this is *occult*. By *exoteric* I mean out in the open; religions that are commonly practiced in public.
[1317] Taoism, in particular, had been a rebellious philosophy favorable among radical peasants in China
[1318] And then the Enlightenment periods of history, and eventually liberal revolutions to establish republican governments and capitalistic economies

society would occur. The authors of the CrimthInc. (ex-)Workers Collective, in *Days of War, Nights of Love*, write that

> Across almost two millennia, the Catholic Church maintained a stranglehold over life in Europe. It was able to do this because Christianity gave it a monopoly on the meaning of life: everything that was sacred, everything that mattered was not to be found in this world, only in another. Man was impure, profane, trapped on a worthless earth with everything beautiful forever locked beyond his reach, in heaven. Only the Church could act as an intermediary to that other world, and only through it could people approach the meaning of their lives.

They say,

> Mysticism was the first revolt against this monopoly: determined to experience for themselves a taste of this otherworldly beauty, mystics did whatever it took — starvation, self-flagellation, all kinds of privation — to achieve a moment of divine vision: to pay a visit to heaven, and return to tell of what blessedness awaited there. The Church grudgingly accepted the first mystics, privately outraged that anyone would sidestep its primacy in all communication with God, but believing rightly that the stories the mystics told would only reinforce the Church's claims that all value and meaning rested in another world.[1319]



Christian heresy may really have picked up with the Paulicians, before being adopted by Bogomil and the Bogomils and Cathars, Peter Waldo and the Waldensians, John Wycliffe and the Lollards, before reaching Jan Hus and the Hussites. It would find a strong home in both the Cathars and the Hussites, both of whom had crusades waged against them,[1320] and among Anabaptists. Many of these people and movements rejected ecclesiastical authority. Perhaps the first person burned as a heretic in Europe was Ramihdrus of Cambrai, followed by Peter of Bruys. Early heretics tended to question the sacraments given to them at mass, as well as the merits of infant baptism. Other sources of heresy within Christianity would include the Orleans Heresy— in which the first recorded burning of humans occurred—, Origen, Paul of Samosata, Arius, John Scotus Eriugena, Tanchelm, Peter Abelard, Henry of Lausanne, David of Dinant, Ortlieb of Strassburg, Joachim of Fiore (and followers such as Tommaso Campanella), Gerrard Segarelli, Fra Dolcino, John Ball, Melchior Rink, and Thomas Muntzer, to name but a small number of them, many of whom were renounced or excommunicated by the church or were burned at the stake for their heresies. Thinkers such as these inspired heretical thinkers (such as Giordano Bruno) that would later become known as predecessors of rational and empirical scientists.

Heretical or civilly-disobedient movements[1321]— whose oftentimes lay leaders would preach in opposition to church or feudal doctrine or authority— would often meet a fate worse than death in the flames of the Inquisition, an institutional network and judicial system established to persecute heretics.

[1319] CrimethInc. Workers Collective, 42

[1320] Many of the Alevis in Turkey, following a path called *Ishikism*, suggest that their religion is the source of all esoteric and exoteric religions, that their name is in reference to the Luvians whose own meant "People of the Light," and that Christian heresies in Europe, such as the Paulicians, Bogomils, Waldensians, and Cathars were Alevis in hiding. The truth of this I am not sure of, but it is an interesting claim nonetheless.

[1321] Such as the Arnoldists, Bogomils, Tondrakians, Waldensians, Cathars ("Good Christians"), Lollards, Hustines, Free Spirit, Dulcinians, Beguines & Beghards, Alumbrados, Ortlibenses, Joachimites, Apostolic Brethren, neo-Adamites, Men of Understanding, and Strigolniki

It should be remembered that *heretic* refers to anyone who dares choose what to believe for themselves. *Anabaptist* sentiments— those tending to oppose infant baptism or to otherwise engage in "re-baptism"— would be inspired by the proto-Reformers as well. Later on down the road, the Anabaptists would lead much of the Radical Reformation. They would be joined in this by unitarians, universalists, millenarians, pantheists, and others as well.

Groups such as the *Goliards*, a *milieu* of other-than-first-born sons who did not inherit property or titles, and who turned bitterly instead to the clergy, would hold festivals such as the *Feast of Fools*, a celebration in which the upper clergy and the Pope was mocked, official relationships of authority were reversed, drunkenness ensued, and satirical and erotic poetry might be shared, among other merriments. They might be contrasted to *troubadours*— also poets, who focused on concepts of chivalry and courtly love—, instead focusing on hedonism and lust. Many of their activities bordered on blasphemy and the Church condemned the Feast of Fools, though it took some time for the practice to die down.[1322]

Any number of reasons—political, religious, or ecological— could cause peasants, smallholders, artisans, and other commoners, yeoman, or gentrymen, or even petty nobles to act up.[1323] Members of these classes, all throughout Europe, North Africa, and Russia (as well as in the rest of Asia), would be found in upheaval against the imposition of religious doctrine, would riot against taxes, rise up against unfair laws, rebel against feudal authority, revolt against monarchy, and war against foreign occupation, as well as react at times as royalists to preserve traditional authority. Norman Cohn, in *The Pursuit of the Millenium: Revolutionary Millenarians and Mystical Anarchists of the Middle Ages*, says "[j]ourneymen and unskilled workers, peasants without land or with too little land to support them, beggars and vagabonds, the unemployed and those threatened with unemployment, the many who for one reason or another could find no assure and recognized place," had been "living in a state of chronic frustration and anxiety," and thereby "formed the most impulsive and unstable elements in medieval society." He suggests that any kind of shaking up of social life from any sort of "disturbing, frightening or exciting event" had "acted on these people with peculiar sharpness and called forth reactions of peculiar violence," and that "one way in which they attempted to deal with their common plight was to form a Salvationist group under a messianic leader."[1324]

The rebellions are numerous, and many of them occurred during the *Medieval Warm Period* and Little Ice Age, the transition of which included the *Great Famine of 1315*. Nolan and Lenski suggest that

---

[1322] The Goliards, along with efforts such as the Knights Templar, and, later, Rosicrucianism, would be involved in efforts to establish a New World Order. This New World Order would involve a revolt against the Old World Order that privileged first-born sons and disinherited the younger ones.

[1323] Among some of the examples of revolts among Europeans and Russians would include, in a non-exhaustive list: The Circumcellions, Stellinga, the Norman Peasants' Revolt, the Pagan Reaction in Poland, the Vata Pagan Uprising, the Peasant Revolt in Flanders, St. George's Night Uprising, Jacquerie, the Ciompi Revolt, Wat Tyler's Rebellion, Harelle and the Maillotins Uprising, the Transylvanian Peasant Revolt, the Funen and Jutland Peasant Revolts, Jack Cade's Rebellion, John and William Merfold's Rebellion, the Rebellion of the Remences, the Carinthian Peasant Revolt, the Friulian Revolt, the Poor Conrad Rebellion, the Gyorgy Dozsa Rebellion, the Slovene Peasant Revolt, the Frisian Peasant Rebellion, the Revolt of the Brotherhoods, the German Peasants' War, the Dalecarlian Rebellions, the Dacke War, Kett's Rebellion, the Croatian-Slovene Peasant Revolt, the Cudgel War, the Bolotnikov Rebellion, the Peasants' War in Austria, the Reaper's War, the Swiss Peasant War, the Morningstar Rebellion, the Peasant Rebellion in Podhale, the Second Brotherhood, the Revolt of the Barretinas, Kuridza's Rebellion, the Bavarian People's Uprising, the Bulavin Uprising, Koliyivschyna, Pugachev's Rebellion, the Revolt of Horea, Closca, and Crisan, Shays' Rebellion, the Saxon Peasants' Revolt, the Kosciuszko Uprising, the Galician Slaughter, the Mathra War, the Peasants' War in the Netherlands Against the French, the Tyrolean Rebellion, the Gottscheer Rebellion, the War in the Vendee, and Chouannerie.

[1324] Cohn, 59

"these peasant uprisings were not 'revolutions,'" but that "what the peasants wanted was a *return to the old order*, not its replacement with a new one."[1325] These kinds of conflicts would at times be talked about, put into lore, and sung about by minstrels, inspiring generations to attempt the same thing in opposition to increased taxes, seigniorage, usury, the lack of protection from routiers, pirates, and bandits, feudalism itself, Christian or Catholic dominance, etc. Famous legends of heroic robbers, who stole from the rich and gave to the poor, men such as the Ukrainian Oleksa Dovbush and the English Robin Hood,[1326] would find their way into folklore through song, story, and poetry, along with men like William Tell, whose tyranicide inspired rebellion, possibly associated with the origins of the Swiss Confederacy. These stories are still with us today.

Feudalism in Normandy and England began its decline with the peasants' revolts against serfdom. Peasant revolts were likely responsible for the end of serfdom all throughout Europe, though their effects would take awhile to set in in many cases. Had they established an infrastructure to support their own lives, they may have been more immediately successful. The *bourgeoisie* would learn from their mistakes in years to come.

Medieval Pantheism and Millenarianism

Perhaps the most radical belief among medieval heretics was pantheism. The sublime Oneness described by pantheist philosophy entails a tendency toward unity that would often directly or indirectly inspire community and political arrangements such as lay monasteries, sodalities, guilds, communes, and republics. A short list of outspoken European pantheists of the medieval period would include John Scotus Eriugena, Amalric of Bena, David of Dinant, Raymond Llull, John of Ruusbroec, Nicholas of Cusa, Paracelsus, Giordano Bruno, and Lucilio Vanini.

John Scotus Eriugena was an Irish[1327] theologian and philosopher with a marked tendency to pantheism. His *magnum opus*, *Periphyseon*, or *The Division of Nature*, was a five-volume philosophical treatise on Nature, which was understood to be the totality of all things, and had within itself Being and non-Being. Creation was really *theophania* or the manifestation of God to mortals. He held, in his *Treatise on Divine Predestination*, that "true religion is true philosophy" and vice-versa.[1328] He said that, "if all that is in God is God, and if the will of God is in God, the will of God is, therefor, God."[1329] Eriugena held that humans called God by different names. He says,

> human reason, guided by truth, understanding its God in a multiplicity of ways, names him according to the modes of its own understanding by various descriptive designations. To take just a few of the possible examples: whenever the insight of reason touches upin the eternal intelligence in which all things are, namely, God himself, it perceives that there the divine intelligence itself possesses a very complete and perfect notion of its own eternal and immutable substance, going beyond the understanding of any creature. This divine notion by which God understands himself is properly called wisdom.[1330]

Eriugena expressed voluntaryist sentiments, such as that "rational life was bound not to have been made otherwise than voluntary."[1331] His work *The Divisions of Nature* is composed of a dialogue

[1325] Nolan and Lenski, 159
[1326] Robin Hood is considered by Augustin Thierry to have been a resistance leader against the Norman Invasion
[1327] He also stayed in France, including Laon, where the peasant confederation mentioned by Kropotkin had been

between a student, called an *Alumnus*, or "illuminati," and a teacher called a *Nutritor*. Maurice de Wulf, in *History of Mediaeval Philosopy*, says that "Erigena's philosophy" had "exercised a great influence on the development of Western thought in the Middle Ages," that the "majority of those who utilized his De divisione natures interpreted his unitive ideas in the sense of a real monism."[1332]

Amalric of Bena had taken great influence from Eriugena, but had also become quite the scholar on Aristotle. He taught that God is all and that everything is one within God and that one who remains in love with God cannot sin. Among his followers, the Amalricians, it was understood that Hell was ignorance, but that those who understood that God is in everything find themselves in Heaven. Even evil is part of God. Amalric's eschatology was universalist. Amalric's body was burned as a heretic after his death. Christopher Knight and Alan Butler, in *Solomon's Power Brokers: The Secrets of Freemasonry, the Church, and the Illuminati*, say that

> Amalric was among the first Western thinkers since ancient times to draw extensively on Neoplatonist Greek philosophy. In doing so he provided a very important precedent as far as the future development of European political and religious thinking were concerned. [1333]

William Aurifex had been an Amalrician, and probably a Hermetic alchemist, who formalized the Brethren of the Free Spirit, the source of the Heresy of the Free Spirit. Like all of the Amalricians, Aurifex was a pantheist.

David of Dinant, a teacher by profession like Amalric, may have been an Amalrician himself, but was most certainly a pantheist philosopher, probably influenced by Aristotle. He held that all things have God for their essence, and that matter and intellect are the same as the substance of God. David escaped persecution, but anyone who was found with his writings was considered a heretic.

Ortlieb of Strasbourg, an eternalist opposed to creationism, and possibly an Amalrician, started a pantheist sect that was considered heretical. He rejected external authority such as that of the Church, saying "[a] man ought to give up all externals and follow the leadings of the Spirit within himself."

Meister Eckhart is perhaps the most publicized of the Christian mystics. He is associated with the Friends of God and other pious lay Christians. He would be accused of heresy and apparently died awaiting his trial.

Raymond Llull, called also *Doctor Illuminatus*, was a natural philosopher, mystic, poet, and evangelist. He is considered to be a forefather of computation and a master of the Art of Memory, to which he contributed, as well as of encyclopedic knowledge. His view of God was influenced by pantheists and would influence other pantheists to come after him. Having previously lived a "licentious" life as a *troubadour*, or lyric poet, he would set about his mission of converting Jews and Muslims to Christianity *by their own accord*. Llull, a Franciscan monk, was among the first to attempt such evangelization by the word, instead of by the sword, in this period. In order to go about this, and earnestly believing (and sometimes succeeding) that he could win Jews and Muslims over to Christianity through rational discourse, he set about his philosophy, largely encapsulated in his art.

[1332] de Wulf
[1333] Knight[2] and Butler

Llull, himself influenced by Eriugena and Joachim of Fiore,[1334] held that there was no strict distinction between fields of knowledge and a comprehension of God's attributes, but that God was the interrelationship between all fields of inquiry. As such, he established a system of categorizing all knowledge. He said, "God is a single essence with multiple attributes, the beginning in which goodness, grandeur, eternity, and the other dignities convert each other reciprocally." For Llull, "[n]o science or knowledge is complete without the science of the love of God." According to William Godwin,

> Lulli recommended that certain general terms of logic, metaphysics, ethics or theology should first be collected. These were to be inscribed separately upon square pieces of parchment. They were then to be placed on a frame so constructed that by turning a handle they might revolve freely, and form endless combinations. One term would stand for a subject, and another for a predicate. The student was then diligently to inspect the different combinations that fortuitously arose, and exercising the subtlety of his faculties to select such as he should find best calculated for his purposes. He would thus carry on the process of his debate; and an extraordinary felicity would occasionally arise, suggesting the most ingenious hints, and leading on to the most important discoveries.

Using his philosophy, Llull established a means for natural and religious discourse to coexist, as well as for Jews, Christians, and Muslims to learn from one another. This is a strong example of emerging proto-Mutualism as it relates to religion. Mutualism is a convergent and hybridizing force that is typically strongest where freedom of exchange is allowed.

Llull is perhaps the strongest example of a philosopher coming out of *la Convivencia*, or *the Coexistence*, the cultural phenomenon in Islamic controlled Spain wherein Jews, Christians, and Muslims were understood to have shared in relative toleration toward one another's views and even to have benefitted greatly from cultural exchange with one another. Indeed, this convergence was one of the principal means by which the Islamic Golden Age would influence Europe, leading to the Renaissance, Reformation, and then the Enlightenment. In Llull, the Radical Reformation and Great Awakenings find a common source with the Radical Enlightenment and free thought. Llull's thinking, that is, bridges the divide between science and religion, and is both a source of serious religious evangelism and discourse on natural philosophy. Both Free thought and Christian evangelism owe themselves to Llull's pantheistic and interdisciplinary approach to natural philosophy and religion.

Llull, himself influenced by the pantheism of Eriugena, would go on to influence such pantheists as Nicholas of Cusa, Paracelsus, Giordano Bruno, and perhaps David of Dinant and Spinoza[1335] as well. He would also be an influence on evangelical Christianity and Rosicrucianism, Heinrich Agrippa, and Petrus Ramus, who established *Ramism*. He is recognized as a saint by some and a heretic by others.

John of Ruusbroec was a mystic who was involved in the *Friends of God*, a mystical group of both ecclesiastics and the laity having come from the teachings of Meister Eckhart; and the *Brethren of a Common Life*, a pietist group formed by Gerard Groote that was neither strictly nor regularly observant, whose schools Nicholas of Cusa would attend,[1336] and which were characterized by the proto-Protestant concept of the Modern Devotion, and were often compared to the Beguines and Beghards, sodalities of lay Christians. Ruusbroec's mother joined a beguinage, but he was critical of the Heresy of the Free Spirit. Nicholas of Basel, a Beghard, was said to have run the Friends of God at one point as well, but

[1334] Other sources of influence included Francis of Assissi and Pietism, Arnaldus de Villa Nova, Matthaeus Platearius, Johann Heinrich Alsted
[1335] Who took to psycho-physical parallelism as is usually attributed to Llullism
[1336] As did Andreas Vesalius

was burned at the stake for heresy. These would become, like the beguinages, an important emanation point for pantheistic heresy.

Nicholas of Cusa, the son of a ferryman who had earned his place as a Cardinal in the Church, was a pantheist (or pandeist) who held—according to James Francis Yockey's *Meditations with Nicholas of Cusa*— that

> Divinity is the enfolding and unfolding of everything that is. Divinity is in all things in such a way that all things are in Divinity.[1337]

Nicholas believed that God was ultimately unknowable, but that through *learned ignorance*— something like the claim by Socrates to know he did not know, or the suspension of judgement in Stoic and Pyrrhonist philosophy— one could approach an understanding of God that was beneficial, even if incomplete. He symbolized God as a perfect circle, and the mortal knowledge of humans as corners on a polygon,[1338] with each thing known as one of the corners. By collecting corners, one gets closer to forming a circle, but can never reach it until the corners themselves no longer exist, a task that is impossible because of our condition as mortals. Nicholas described what he called a "*coincidence of opposites*," a sort of non-duality in which one recognizes the mutual tensions of opposites, which inhere in all things, and are thereby one. Recognition of the unity of opposites would unite the individual with the Oneness of existence, or with the *unus mundus* or "one world." He philosophically anticipated the heliocentrism of Copernicus, who would later prove that the Sun was at the center of the solar system. Of interest to Mutualism, Nicholas would propose a ranked-choice voting method[1339] similar to the Borda count, for use of electing Holy Roman Emperors. His efforts represent perhaps the most vigorous attempt at actually reforming the Catholic Church from within while keeping it intact. For this reason, and, while the Anabaptist and proto-Protestant heretics and those to follow after them are properly placed in the proto- or Radical Reformation as well, Nicholas of Cusa might be considered a centerpiece of the Radical Reformation *milieu* despite his having been an insider of the Church hierarchy, having really shaken up the politics within the Church. Nonetheless, his treatment of the Hussites is disappointing, and was so for the many Anabaptists and Protestants who otherwise looked favorably to him. Nicholas seems to have desired to reconcile hierarchy and consent of the governed.[1340]

Known as a doctor to the poor, Paracelsus was a pioneer of the "medical revolution" and is the "father of toxicology," holding that "only the dose makes the poison" and believing certain elements to target particular organs, the duty of the organs being to distinguish between purities and impurities. He held that one's mental states correlated with one's physical condition, such that a person who has a good conscience would tend toward good health, but that those with ill intentions will generally face hardships. Ultimately, Paracelsus believed, as a Hermeticist, that good health was about harmony between the human being, the microcosm, and Nature, the macrocosm. He believed that certain minerals and plants needed to be ingested because of their correspondences with particular organs (sometimes called the *Doctrine of Signatures*) and astral bodies. He believed that wounds needed to be kept clean, and that doing so would allow Nature to heal them. He is considered an important step toward chemistry from alchemy, and believed that science was more than about simple discoveries, but

---

[1337] Yockey, 29

[1338] He may have gotten this idea from Archimedes

[1339] Voting grew from out of cleromancy as a better means of approximating the outcomes of Divine Will than cleromancy, because voting produced more stable results than such things as rolling dice by aligning more closely the human will and so thereby reducing conflict

[1340] Somehow this did not stop his repression of the Hussites

about how these discoveries can tell us more about God. His pantheism drew from Hermeticism, neo-Platonism, and neo-Pythagoreanism.[1341] Expressing a sort of Llullist view, Paracelsus says,

> All numbers are multiples of one, all sciences converge to a common point, all wisdom comes out of one centre, and the number of wisdom is one [...] Those who love the luminous circle will be attracted to it, and their knowledge comes from God

The mystic Jacob Bohme had taken some influence from Paracelsus. He was a self-taught thinker, being a shoemaker by profession, before becoming a glove merchant. His books had been burned, an act he attributed to Pharisaical forces. He held that the Fall of Man was a necessary stage in the Universe, allowing man to come back to God. Bohm would become especially influential among Rosicrucians and Martinists later on down the road.

Giordano Bruno was a Dominican friar and philosopher who, like Llull and Paracelsus, took great influence from Hermeticism. Like the others, Bruno had a pantheist worldview that inspired an organic outlook on Nature, and, for Bruno, like Llull and Paracelsus, this allowed an interest in magic to coexist with natural philosophy. Nonetheless, Bruno came to many rational conclusions, such as the belief that the stars are suns to other planets, possibly containing life. He saw this as occurring within an infinite Universe. Considered one of the earliest of free thinkers by many, Bruno met his fate by being burned at the stake.

Lucilio Vanini was a free thinking philosopher, pantheist, and intellectual libertine. Perhaps anticipating John Toland, he spoke of prominent religious figures as imposters. Vanini— in a way anticipating the *best of all possible worlds* argument of Leibniz's theodicy— had suggested that the most perfect creation would be imperfect so as to allow for change, a view he claims to have derived from Empedocles, in contrast to Aristotle, who sees the definition of *perfection* tied up with that of *completeness*.[1342] Lucilio Vanini was among the first to understand the Universe as being governed by natural laws. Vanini heralded evolution theory when he suggested, centuries before Darwin, that humans and other apes share a common origin. Lucilio warned of the dangers of the imagination of the elites, who promoted false beliefs to gain power. He was also among the most materialistic of the pantheists. He was tried for atheism and was sentenced to have his tongue cut out, to be strangled, and have his corpse burned to ash.

These individuals are not the only pantheists to have existed in the Middle Ages, but merely serve as examples of outstanding pantheists of the period. Others, such as Peter Waldo, may also have been pantheists, but were not as widely reported as such. It does seem, however, that those who were most inclined to a comparative study of religion and Nature tended to develop pantheistic beliefs. Pantheists of these sorts tended to organize themselves into *sodalities*, or *confraternities*, voluntary associations of lay people chartered by the Church, often spoken of alongside guilds. Like the followers of Peter Waldo, the Lollards, they assisted with burials and attended services. Sodalities also organized convivialities and escorted condemned heretics.

Millenarianism, the belief that a new millennium was coming that would change the existing world order, was another radical view held by the heretics of the time, and it looked forward to the turning of

---

[1341] Perhaps the most important of the neo-Pythagoreans was Philolaus. Philolaus, Greek philosopher and follower of Pythagoras who opposed the geocentric model of the Universe, suggested that everything tended toward a central point, the Central Fire, in the Cosmos. He believed the Universe, including its component parts, to consist of a Harmony between the Limited and Unlimited, and that the limiting force was necessary for our comprehension of an ordered world.

[1342] This "Best of Possible Worlds" view might be described as quintessentially Luciferian

the age, typically involving the return of Christ or one of his successors, such as Amalric of Bena or, later and in the Jewish tradition, Sabbatai Zevi. Joachim of Fiore had held that the Father, Son, and Holy Spirit were the Past, Present, and Future, and that the Present age had been fulfilled by Jesus Christ, with a new millennium going to give way. The Amalricians understood Amalric of Bena to be the successor of Christ, and to be bringing in the New Age. Millenarianism would have a major impact, becoming responsible for major peasant revolts and going on to inform many of the existing Christian belief-systems.

Free Spirits

The Heresy of the Free Spirit had been a particularly radical and heretical rational-mystical sect, influenced by a millenarian form of primitive or post-Christian pantheism. The heresy would promote a pantheist theology in which God was understood to be everything as a whole, and which suggested that human behavior itself was divine, so long as it was recognized as such, and that sin was impossible for adepts of the heresy, so long as they acted in love of God (the whole). Having been prominent among the textile industry,[1343] the Heresy of the Free Spirit represent an eclectic bunch of free thinkers that would influence later radical traditions. They had based their worldview on illuminist thought rooted in an eclectic immersion in Sufism, neo-Platonism, and Aristotleanism, among other things, and as informed by their own Christian faith through the Celtic priest Eriugena, Amalric of Bena, the millenarian Joachim of Fiore, and perhaps by remnants of ancient paganism and Gnosticism. They had been awakened to the perennial philosophy and the *prisca theologia*— or original religion—, which was rooted in pantheism.[1344] In the hands of the poor, this was a dangerous worldview to authorities, whose political control and economic power rested on the acceptance of exoteric religion, which separated the lower classes of humanity from God and Nature. Should they awaken to natural law, and the divinity within themselves, the foundations for the upper class's monopoly on power would be shaken.

The Free Spirit had followed in the footsteps of and was seeded by the pantheist theologian, Amalric of Bena, and his Amalricians. Cohn says that Amalric had been a brilliant lecturer in logic at the University of Paris."[1345] William Turner, in "David of Dinant," holds that the University of Paris, where Amalric had taught, "was being made the scene of an organized attempt to foist the Arabian pantheistic interpretation of Greek philosophy on the schools of Latin Christendom," suggesting that literature from Muslim Spain circulated "doctrines incompatible with Christian dogma."[1346] The Heresy, which was particularly prevalent among textile workers, would be influenced through philosophic exchanges with Muslims along the Silk Road, as well as by the illuminationism passed on by Sufi poet-philosophers similar to Ibn Al-Arabi, in Andalusia (modern Spain).[1347] The pantheist outlook is one that

---

[1343] In which Mutualism-proper would develop. Outside of the Stedinger, and among the heretics, Amalric of Bena, his Amalricians, the Brethren and Heresy of the Free Spirit, and the loosely associated Beguines and Beghards, may be among the most significant influences on what would become Mutualism, a tradition passed on largely through the textile industry, which was saturated with the heresy in medieval Europe. Their prominence among textile workers, and their libertarian anti-capitalist sentiments make the heresy an ideal candidate for the sort of cultural stock from which Mutualism would grow from out of during the Middle Ages.

[1344] Pantheism had not yet been given these names, *prisca theologia* and *perennial philosophy*

[1345] Cohn, 152

[1346] Turner

[1347] The Mongols had established much control along the Silk Road, and— their native Tengrist religion being highly syncretic— those who controlled Moghulistan had taken to Islam. Because of their control of much of the Silk Road, they had established themselves a great influence on the textile industry, and an intermediary between China and Europe. While China controlled the production of silk, the Moghuls controlled its path to markets in Europe. Naturally, the messages of Buddhism were passed alongside those of Islam, eventually becoming a traditional religion among the Kalmyks, the Oirat Mongols in the Eastern European Kalmykia, a Western subject

is naturally empowering to the individual who holds to it. And Sufist and Christian pantheisms would cross-pollenate one another. Norman Cohn tells us that it is "likely that Sufiism" had taken influence from "certain Christian mystical sects in the East," and that in exchange it had "assisted the growth of the mysticism of the Free Spirit," and that "every one of the features that characterized Sufiism in twelfth-century Spain—even to such details as the particoloured robes—were to be noted as typical of the adepts of the Free Spirit a century or two later."[1348] Amalric's pantheism, his teachings of Aristotle, and his neo-Platonism overlapped greatly with the Sufi influences the Free Spirit had been exposed to.

William Turner says, speaking of the Cathars and then the Free Spirit, that a "popular movement in the South of France" had "found its principal expression in the Albigensian heresy, while in learned and ascetic communities in the North, the anti-hierarchical mysticism of the Calabrian Joachim of Fiore was being combined with the more speculative pantheistic mysticism of John Scotus Eriugena."[1349] Amalric of Bena, the Amalricians, and the Free Spirit would have been right in the middle of such an effort. Cohn says that "Amaury's own doctrine" had been "a mystical pantheism which owed much to the Neo-Platonic tradition and particularly to the most distinguished exposition of Neo-Platonism that had been made in Western Europe, the [*Division of Nature*] of Johannes Scotus Erigena."[1350] Maurice de Wulf says that "Amalric of Bene drew from the De divisione his own pantheistic theories," and that even though the Pope "ordered that the work of the Palatine philosopher [...] should be burnt, it did not altogether disappear from literary circulation."[1351]

Amalric was not alone in his millenarianism, nor in his influence on the Free Spirit. Millenarianism was a very common theme among the Free Spirit, and was also inspired by Joachim of Fiore, whose themes, converging with Amalric's in some respects, taught that the trinity represented the past, present, and future ages. De Wulf says that "Joachim's interpretations made a great impression upon all the illuminati of the time, such as the Amalricians, and also in the thirteenth century, on the Spirituals and the Fraticelli of the Franciscan Order, who thought they saw the realization of Joachim's prophecies in the institution of the mendicant orders."[1352] Norman Cohn says that "[r]evolutionary millenarianism flourishes only in certain specific social situations," and that well-integrated peasants and artisans "might revolt or they might accept their situation; but they were not, on the whole, prone to follow some inspired *prophetae* in a hectic pursuit of the Millennium."[1353] He says,

> Unlike the leaders of the great popular risings, who were usually peasants or artisans, *prophetae* were seldom manual workers or even former manual workers. Sometimes they were petty nobles; sometimes they were simply imposters; but more usually they were intellectuals or half-intellectuals—the former priest turned freelance preacher was the commonest type of all.[1354]

Nonetheless, lay preachers *did* gain a following among the poor. Cohn also says that the "poor did not create their own millenarian faith, but received them from would-be prophets or would-be messiahs," and that the preachers, "many of them former members of the lower clergy," had taken "their ideas from the most diverse sources," such as "from the Jews and early Christians, and others from the

twelfth-century abbot Joachim of Fiore," but that, still more were "concocted by the heretical mystics known as the Brethren of the Free Spirit."[1355]

Knight and Butler suggest that after Amalric had died, that the Amalricians had gone even "further with their heretical beliefs," that, as with the Joachimites, they had "declared that God had revealed himself, and would do so again, in a threefold manifestation," and that "the Age of the Father and the Age of the Son" had come, but that "the Age of the Holy Spirit" had begun as "God manifesting as Amalric himself. Some of the Amalricians took their master's words [...] to mean that they could do absolutely *anything* they desired, freed from the possibility of divine retribution."[1356] These claims, of course, echo the trinitarian claims of Joachim of Fiore, who had claimed much the same about the Ages of the Father, Son, and Holy Spirit. Rudolf Rocker tells us that

> The revolutionary urge of the masses was directed not only against the Roman Papacy, but was meant to abolish social inequalities and the prerogatives of the rich and powerful. The leaders of the popular movement felt that these were a mockery of the pure Christian teaching of the equality of men. Even after the church had achieved its power the spirit of the early Christian congregations, with their communal mode of life and the feeling of brotherhood animating them, had never been quite forgotten among the people. The origin of monasticism was to be traced to this cause; likewise, the spirit of millennialism, the belief in a thousand year reign of peace, freedom and common possessions. This found an echo also in the speeches of Joachim of Floris and Almarich of Bena.[1357]

As well as Eriugena, Sufis, Amalric, and Joachim, the Free Spirit found influence in the works of Aristotle, an influence from Ancient Europe on medieval Europe brought back from the Middle East, and popularized by such Islamic philosophers as Avicenna and Averroes, and by Amalric himself. The Heresy of the Free Spirit had also gained from a rising interest in esoteric religion, carrying over from Renaissance Gnosticism and Kabbalah. The widespread Cathar heresy in particular stands out, along with the sensationalized Catholic Holy Orders, such as the Hospitallers, the Templars, Teutonic Knights, who'd often taken to some heresy themselves during the Crusades.[1358] Among the Amalricians and the Brethren of the Free Spirit, and those who the Church associated with their heresies, including the Beghards and Beguines, free thought had been spread particularly strongly.

Norman Cohn says that the participants in the Heresy of the Free Spirit had been "gnostics intent upon their own individual salvation; but the gnosis they arrived at was a quasi-mystical anarchism—an affirmation of freedom so reckless and unqualified that it amounted to a total denial of every kind of restraint and limitation," and that they "could be considered precursors of Bakunin and Nietzsche."[1359] Gnosticism was inclined toward emanationism, which suggests that all things flow from a first principle of underlying reality, such as the neo-Platonic Source or the Monad. Gnostics held knowledge to be of primary importance and the ultimate saving grace, and often held it up to the level of divinity. Believing God to be something experienced in Nature, but especially from within, gnostic worldviews could be skeptical of authority which did not allow for the antinomian pursuit of truth. CrimethInc. writes that

---

[1355] Cohn, "Introduction"
[1356] Knight[2] and Butler
[1357] Rocker[1]
[1358] The heretics included anyone from the Free Spirit that were part of the Radical Reformation to the Knights Templar who had taken part in the Radical Counter-Reformation, as I have so labeled it here. Together, the heretical radicals of the Middle Ages burnt at the stake for their shared gnosticisms, and bled on the battlefield one against the other, as with the Crusades against the Taborites and other radicals of the time by orders such as the Templars. Bound together in their gnosticism, they were nonetheless divided by class interests.
[1359] Cohn, 148

> one day, a new kind of mysticism appeared; those who practiced it were generally known as the Brethren of the Free Spirit. These were men and women who had gone through the mystical process, but returned with a different story: the identification with God could be permanent, not just fleeting, they announced. Once they had had their transforming experience, they felt no gulf between heaven and earth, between sacred and profane, between God and man. The heretics of the Free Spirit taught that the original sin, the only sin, was this division of the world, which created the illusion of damnation; for since God was holy and good, and had made all things, then all things truly were wholly good, and all anyone had to do to be perfect was to make this discovery.
>
> Thus these heretics became gods on earth: heaven was not something to strive towards, but a place they lived in; every desire they might feel was absolutely holy and beautiful, and not only that — it was the same as a divine commandment, more important than any law or custom, since all desires were created by God. In their revelation of the perfection of the world and themselves, they even were able to go beyond God, and place themselves at the center of the world: accepting the Church's authority and objective world view had meant that if God had not invented them, they would not exist; but now, accepting their own desires and perspectives as sovereign, and therefore asserting their own *subjective* experience of the world as the only authority, they were able to see that if they had not existed, then God would not exist.[1360]

It's important to mention here that Crimethinc maintains a postmodern agenda as cultural Marxist quasi- or pseudo-anarchists, and so when they stress the subjective side of the Free Spirit, and though they are not incorrect, they do so at the expense of the objective side for cultural-political reasons. In reality, the Free Spirit, though they did hold a certain respect for the subjective side of life, were inspired largely by the neo-Platonism and Aristotleanism of Amalric of Bena, which was natural philosophy that stressed a great deal of objectivity. Like other pantheists, the Free Spirit were interested in bridging the gap of the subjective and objective, so as to grasp the Absolute. Pantheists typically adhere to a neutral monist metaphysic with corresponding epistemologies and ontologies.

Second to Amalric, the heresy had been spread by the alchemist and Amalrician, William Aurifex, and his Brethren of the Free Spirit. Norman Cohn says that the main influence of the Free Spirit was "a certain William, also a cleric and trained in theology, but known as *Aurifex*— which has resulted in his being regarded as a goldsmith but may have meant that he was a philosophical alchemist." He says that "the dormant magical powers of the soul, which it was the ambition of such alchemists to awake, were often symbolized by gold."[1361] Norman Cohn tells us that the Free Spirit, "elaborated into an all-embracing theological and political system," had been "fourteen in number and all of them clerics—parish priests, chaplains, deacons, and acolytes from Paris and its environs."[1362]

While the Cathars' adepts would be known as *perfecti* the adepts of the Free Spirit were often called *illuminati*. In fact, in Spain, a later sect of Free Spirit adepts are called *Alumbrados*, or *illuminated/enlightened*. Conspiracy authors Christopher Knight and Alan Butler relay to us that "*Illuminati* simply means 'enlightened ones', having a very similar meaning to the term 'Gnostic', one possessing *gnosis*, enlightened wisdom or knowledge," and that "its first recognized appearance comes [...] with the followers of a French theologian by the name of Amalric of Bena (Amaury de Bene)."[1363] The Alumbrados, who are possibly the source of the Jesuit Society, and following after Eriugena, seem

[1360] CrimethInc. Workers Collective, 42
[1361] Cohn, 152
[1362] Cohn, 152
[1363] Knight[2] and Butler

to have lent their name to the various *alumni* who are the graduates of colleges and universities, many of which were established or supported by Jesuits and Rosicrucians. These pantheist sects— the Amalricians and the associated Brethren of the Free Spirit— appear to be the original *illuminati*— "enlightened ones"— of the West. Their natural-mystical pantheistic doctrines informed the *illuminati* (or *alumni*) of France and beyond.

Of the Free Spirit, Cohn says that "the heretics were detected and rounded up," and that some of them had "publicly professed their heretical beliefs and were accordingly burnt," and that up until "the moment of death they gave no sign of repentence."[1364] Being burnt at the stake was a fairly common punishment for heresy during the period, so the Free Spirit was not alone in that. Fra Dulcino, Marguerite Porete, Jan Hus, Joan of Arc, Girolamo Savonorola, Giordano Bruno, and many others faced such a fate. Even the Knights Templars, who had become too powerful for the Church, even having claim to have started the first formal system of bank checking, had faced burnings at the stake. One could be burned for having an alternative view of God or the Holy Trinity, by denying the divinity of the officials of the Church or the Church itself, by denying that the bread given at communion was the literal body of Christ, or so on. Despite its repression, the Heresy of the Free Spirit ultimately spread to and inspired the establishment of a large number of sodalities and confraternities, including those associated with the Beguines and Beghards, the Friends of God, and Brethren of the Common Life.

Anabaptist reformers such as Henry of Lausanne, followed by mystics such as Amalric of Bena, Joachim of Fiore, and the Heresy of the Free Spirit seem to have left quite a mark in the minds of textile workers, particularly the Beguines (whose *beguinages*, or lay convents, are often by waterways such as to provide power for their work in textiles) and their less influential, male counterparts, the Beghards, and those who followed after them. The *Beguines* and *Beghards* were lay religious people who dedicated themselves to communal life in a monastery, or to roving around and spreading their heretical ideas and radical concepts more independently or nomadically. They were particularly involved in textile, educational, and medical work, and were dedicated to helping one another against the evils of old age and sickness. They represent some of the strongest instances of mutual cooperation amongst the underclass in the medieval period. Most importantly, perhaps, Beguines and Beghards were especially receptive to the Heresy of the Free Spirit. Mechthild of Magdeburg was a Saxon Beguine. She said that a "fish cannot drown in water, a bird does not fall in air. In the fire of creation, God doesn't vanish: The fire brightens. Each creature God made must live in its own true nature; how could I resist my nature, that lives for oneness with God?" She holds that a "noble soul commands itself, and not others."

Turlupins, too, were associated loosely with the heresy, and were related to the Beguines and Beghards, as well, being a heretical sect that called themselves the "*Society of the Poor*." Jeanne Dauberton was a Turlupin leader who was brunt at the stake for witchcraft and heresy.

Marguerite Porete, sometimes considered a Beguine, and a potential adept of the Heresy of the Free Spirit, was burned at the stake for her work called *Mirror of Simple Souls*. Her title may reflect some of the discussions that may have surrounded Islamic influence from Sufi thinkers. A theme from Ibn Arabi seems to show itself through Marguerite Porete's *The Mirror of Simple Souls*, as Ibn Arabi had described human beings as mirrors for God, by which God can know Himself, by seeing His reflection in the human beings. And interestingly enough, her concept of self-annihilation had been shared by the Sufi heretic, Mansur Al-Hallaj, who had been born a cotton carder, and so was connected to the textile industry, which was also a common place for European heresy. He had taught the masses to seek God within themselves, and idealized self-annihilation and ego-death. Marguerite did the same.

[1364] Cohn, 152

Clifford Harper, in his *Anarchy: A Graphic Guide*, says that "[t]he Free Spirit was probably the world's first major anarchist movement, flourishing throughout the Middle Ages in virtually every part of Europe."[1365] Knight and Butler further say that "Amalrician communities continued, at first openly, and then in secret, across many frontiers but especially in Champagne," and that they "had a profound bearing on other communities, such as the Beghards." Further, "Amalric also impressed a man whose name is still well known in religious circles [...] known as Meister Eckhart."[1366]

Meister Eckhart was a prominent German mystic and theologian, sometimes associated with the Beghards and Beguines (whose attraction he had gained) and more readily with the Friends of God. Eckhart taught about detachment and emptiness, similar to a Buddhist, and was a Dominican, known for their use of rosaries, derived themselves from Buddhist prayer beads. However, he believed God was present in the soul of the individual, and that once emptied, one should reconstruct oneself of the simple goodness of God, which he understood as an overabundance of love in a neo-Platonic fashion, a boiling over from the Source. He had taken some influence from John Scotus Eriugena. He was tried as a heretic, but died before a verdict was rendered. Nicholas of Cusa studied Meister Eckart, as did Henry Suso, a very popular writer of his time.[1367]

The *Friends of God* was a democratic lay group of pious Christians, which included both clergy and laypersons, and which had grown from out of the teachings of Meister Eckhart and his followers, John Tauler and Henry Suso. Later, Nicholas of Basel would become their leader, though he was condemned as a Beghard and burned at the stake. The Friends of God became associated with the Reformation.

These influences would lead toward the creation of the later Brethren of the Common Life.

Radical Reformers

While the most radical of the lot, in some sense, the Free Spirit were not the only heretics that concerned the church, or that would influence the Radical Reformation.[1368] The heretic and reformed banker and silk merchant, Peter Waldo, in renouncing his wealth and becoming a lay preacher, had made a major impact, as well, and before Amalric, leading to a movement called the *Waldensians*. Like the Cathars and Bogomils, Peter Waldo and the Waldensians were probably living in the wake of the Paulicians in the Eastern Mediterranean. Matt Steffon of Encyclopaedia Britannica reports, in "Valdes," that Peter Waldo had been a "successful merchant" who had "underwent a religious conversion, gave away his wealth, and began to preach a doctrine of voluntary poverty." He says Waldo "and his followers—called the Poor, or the Poor of Lyon—were excommunicated for violating the ban on preaching and were banished from the city," and that they "were formally condemned at a church council [...] along with other alleged heretics," and that this "forced them to begin traveling and teaching in secret."[1369] Many Protestants look back favorably to Waldo.

A movement like the Waldensians had been building around John Wycliffe's teachings, too, called the *Lollards*, a word which would become synonymous with *heretic*. John Wycliffe had translated a Bible into vernacular so that the laity could read it. Of this, John Stacey at the *Encyclopaedia Britannica* writes, in "John Wycliffe," that there had been "two translations" of Wycliffe's Bible and that the "Bible

[1365] Harper, 2
[1366] Knight[2] and Butler
[1367] Eckhart would be picked up later by German idealists and Romanticists of the Counter-Enlightenment. Many of the works of heretics of the Radical Reformation— here including modernist Catholics— would be used later on as part of the Counter-Enlightenment. Not everyone who made it to the Reformation made it into Enlightenment.
[1368] Or what would become the conscious Mutualism of the working class
[1369] Steffon

became a necessity in his theories to replace the discredited authority of the church and to make the law of God available to every man who could read." Along with "a belief in the effectiveness of preaching," it "led to the formation of the Lollards." However, the "precise extent to which Wycliffe was involved in the creation of the Lollards is uncertain," but "they propagated his controversial views." Stacey says that "the year when Wycliffe finally retired to Lutterworth, the discontent of the labouring classes erupted in the Peasants' Revolt," but that his "social teaching was not a significant cause of the uprising because it was known only to the learned, but there is no doubt where his sympathies lay. He had a constant affection for the deserving poor."[1370] William Tyndale was a Lollard who was executed for, like Wycliffe, translating *The Bible* into English.

The Lollards had participated in uprisings themselves, as with John Ball and the Peasants' Revolt. John Ball was a traveling radical priest without a parish, often consider a proto-Lollard, and then a Lollard proper, who was famous for having preached the message of John Wycliffe and for having taken part in the Peasants' Revolt, one of the largest revolts of peasants ever to occur.[1371] His most famous sermon contained this commonly-cited passage:

> When Adam delved [meaning to work the fields] and Eve span [as in textiles], Who was then the gentleman? [meaning, 'Where were the nobles in the Garden of Eden?'] From the beginning all men by nature were created alike, and our bondage or servitude came in by the unjust oppression of naughty [evil] men. For if God would have had any bondmen from the beginning, He would have appointed who should be bound, and who free. And therefor I exort you to consider that now the time is come, appointed to us by God, in which ye may (if ye will) cast off the yoke of bondage, and recover liberty.

Ball would be hung, drawn, and quartered, his head put on a pike, and his body parts displayed for all to see in different towns. But the Lollards would go on to influence the democratic practices of Congregationalism, and their practice of burying the dead of mourning families probably lent itself to the early practices among the Mutualist friendly societies of providing burial services.

Jan Hus was a theologian who had been burned at the stake for heresy, after having attacked the clergy for its moral failings and taking of indulgences, and having openly preached in defiance of the Church. Hus had himself been a follower of John Wycliffe, who had attacked the privileged status of the clergy and translated the Bible to make it more accessible to those who did not know how to read Latin. Cohn writes that the demand for reform was adopted by Hus, who had ensured that the Lollard "movement ceased to be merely local and became as wide as Latin Christendom." Hus had been "a popular preacher whose favourite theme was the corruption and worldliness of the clergy." His teachings were feared by those whose religious authority rested on the ignorance of the masses to their conditions. Jan Hus was starting to wake the masses up to the power and control that their ignorance allotted to authorities. Cohn, however, tells us that Hus "offended simply by refusing blind obedience to his ecclesiastical superiors; but that was enough to cost him his life," and that the "core of his 'heresy' was his claim that the Papacy was not a divine but a human institution, that not the pope but Christ was the true head of the Church, and that an unworthy pope should be deposed." Hus's teachings about the earthly nature of the Church would gain a significant following, particularly in Bohemia, where even a significant proportion of nobles would be influenced by him. The influence of Hus's teachings on the nobility would cause major political changes in Bohemia. Cohn, in fact, says

[1370] Stacey
[1371] This occurred during the Little Ice Age

> Hus's execution turned the unrest in Bohemia into a national reformation. For the first time [...] a nation challenged the authority of the Church as represented by pope and council.[1372]

The Hussites, followers of Hus, represented a mass movement of heretical craftworkers and peasants, and one that, like the Cathars, had become militarily significant, claiming vast amounts of territory. Having no patience with the execution of Hus, they took to significant military action. While there were a significant number of lesser nobles involved in the Hussites, Cohn writes that the "great majority of these radicals belonged to the lower social strata; they included weavers and other cloth-workers, tailors, brewers, smiths—in fact manual workers in many trades." Despite their lower-class conditions, though, these individuals would have a significant impact. In fact, Cohn says that the "part played by these people was so striking that Catholic polemicists could even pretend that the whole Hussite movement had from the very beginning been financed by the guilds." However, Cohn stresses that those participating were not wealthy, even those among the participants of the guilds. Those who did participate tended toward radicalism. He says that "if it was the guilds that organized and directed the radical movement," that "the rank-and-file were largely drawn not from the skilled artisans but from the lowest strata of the population—the heterogeneous mass of journeymen, unskilled workers, indentured servants, beggars, prostitutes and criminals," and that the "radical wing of the Hussite movement was largely recruited from this harassed proletariat." He says,

> Radicalism also found massive support amongst the peasantry. The bulk of the rural population had long been dependent on the lords, ecclesiastical or lay, who owned the land.[1373]

In particular, the radical Hussites called the *Taborites* are of interest to Mutualists because they formed something of a democratic society that has been described as anarchistic. Some of the Taborites had been adepts of the Free Spirit, a number of them nudists, becoming known as *Adamites*. The Taborites were known to have held everything in common and to have made decisions in assemblies. Rudolf Rocker says that "[t]he movement of the so-called Taborites embraced especially all democratic elements of the people up to the communists and chiliasts and was inspired with an ardent courage for battle." Similarly, Cohn says that the "extreme Taborites" held that

> the Millenium was to be characterized by a return of the lost anarcho-communist order. Taxes, dues, rents were to be abolished and so was private property of all kinds. There was to be no human authority of any sort: 'All shall live together as brothers, none shall be subject to another.' [...] 'All lords, nobles, and knights shall be cut down and exterminated in the forests like outlaws.'[1374]

As can be seen, the Hussites had much in common with modern radicals. They declared that there would be an end to taxation, that there would no longer be servants and masters, and that property would be held in common. This is a theme that can be found in many anarchist thinkers later on.

The Hussites, and especially the Taborites among them, had been a strong force of proto-Protestantism, having gained much influence, and having had become a "political" power unto themselves, resulting in the Hussite Wars. The Hussite Wars were crusades against the Hussites, wherein the Hussites proved themselves to be a significant military force. In peasant armies, they won victories against professional crusaders. Rudolf Rocker tells the story, saying that

---

[1372] Cohn, 207
[1373] Cohn, 208
[1374] Cohn, 215

> Pope Martin V in a special bull called all Christendom to a crusade against the Bohemian heresy, and an army of 150,000 men recruited from all parts of Europe moved against the Hussites. Now revolt arose all over the land to a devouring flame. Calixtines and Taborites, threatened by the same immediate danger, let their inner differences rest for the time being and united quickly for common defence. Under the leadership of the aged Zizka, an experienced warrior, the first crusading army was bloodily and decisively beaten. But that did not end the struggle; pope and emperor continued their attacks against the Bohemian heresies; and thus developed one of the bloodiest of wars, waged on both sides with frightful cruelty. After the Hussites had expelled the enemy from their own country they invaded the neighbouring states, wasted cities and villages, and by their irresistible bravery became the terror of their foes.
>
> This brutal warfare lasted for twelve years, until the Hussites put the last army of the crusaders to fight in the battle of Taus. The result of the peace negotiations, concluded at the Council of Basle, was the "compact of Prague," which gave the Hussites far-reaching concessions in matters of faith and, above all, announced the renunciation by the church of its estates which the Czech nobility had appropriated.[1375]

Jan Zizka, a lesser noble and a general of the Taborite army, is considered quite possibly the best military leader of all time for his defeating of armies with vastly superior technology, numbers, and training to his own, and for his innovative strategies. Many in the Taborite army were commoners, but they were victorious over much larger armies of knights through their strategic use of armed wagons, in which they made some of the first European use of gunpowder, a technology passed along the Silk Road.[1376] Unfortunately, the Taborites would learn the failures of communism the hard way. Pointing to the inevitable end of the Taborites, Cohn says that "the Taborite revolutionaries were so preoccupied with common ownership that they altogether ignored the need to produce," and that "the more moderate Taborites complained at their synod, 'many communities never think of earning their own living by the work of their hands but are only willing to live on other people's property and to undertake unjust campaigns for the sole purpose of robbing.'"[1377]

What Cohn is describing above is not unlike the degenerate "lifestyle politics" of Marxist situationist-inspired anarchists such as the CrimethInc. "Ex-Worker" Collective, who, at least in their early years, promoted dumpster-diving, vandalism, rioting, squatting, train-hopping, and other lifestyle approaches to not working, branded as a form of revolutionary "dropping out," for which they were often ridiculed. Of course, as Cohn continues, "the anarcho-communist experiment had soon to be abandoned," because no matter how "reluctant the experimenters were to do any work, they could not live without it; and soon the artisans were organizing themselves in a system of crafts very similar to that existing in other Bohemian towns."[1378] Rocker says that the end of the Hussite Crusades

> concluded the war against the external enemies, but only to make place for civil war. During the short breathing spells permitted the Hussites in the war against pope and emperor the differences between Calixtines and Taborites had flamed up anew, repeatedly leading to bloody conflicts. As a consequence, the Calixtines had repeatedly started negotiations with the pope and the emperor. And so it was inevitable that after the conclusion of peace, in which outcome they were chiefly instrumental, they should be supported against the Taborites by their former

[1375] Rocker[1]
[1376] This would eventually lead to the industrial revolution, by putting an emphasis on combustion technologies
[1377] Cohn, 217
[1378] Cohn, 218

> enemies to the best of their ability. In May, 1434, there occurred between the two parties the murderous battle of Lipan, in which thirteen thousand Taborites were killed and their army almost completely annihilated.
>
> With this the popular movement was definitely defeated, and there began hard times for the poor populace of city and village. But thus early it became apparent that the revolutionary popular movement, which by its own or others' fault had come to be involved in a protracted war, was forced by circumstances to abandon its original aims, because military demands exhaust all social forces and thereby nullify all creative activity for the development of new forms of social organization. War not only affects human nature calamitously in general by constant appeal to its most brutal and cruel motives, but the military discipline which it demands at last stifles every libertarian movement among the people and then systematically breeds the degrading brutality of blind obedience, which has always been the father of all reaction.[1379]

The Hussites had put up a good fight, controlling a vast amount of land, and the Taborites among them would have an influence of their own. The experiment in communism would no doubt leave a lasting mark in the minds of outsiders, particularly those who may have had dreams of a Tabor of their own. This experiment in violent anarcho-communism would likely influence a more moderate or conservative outlook among some of those in the textile industry, some of whom may have influenced the development of Mutualism as we have come to know it in the 21st century. And, at any rate, the Hussites helped to kick off the Radical Reformation.

The Hussites were accompanied in the efforts of the Radical Reformation by other groups such as the Waldensians, Lollards, Beguines and Begards, as well as by unitarians, universalists, pantheists, and mystics of other faiths, as well as by Renaissance forces of naturalism and magic coming largely from out of ancient pagan sentiments, including esoteric sources like Hermeticism, Gnosticism, Sufism, and Kabbalah as well as folk beliefs and mundane "witchcraft." Many of the peasants' revolts and heresies included weavers, a bunch of textile workers that has been particularly prone to exposure to "dangerous" ideas. The Cathars were known to have many weavers among them, as were the Hussites, and the Heresy of the Free Spirit was largely carried on by Beghards and Beguines who were also attached to the textiles industry. Many of the heresies common to the weavers were forms of gnosticism and pantheism, and may come from Hermetic sources shared in the Renaissance, Gnosticism coming from the East by way of groups such as the Bogomils, or from native pantheism coming out of Celtic Christianity as might be found in the philosopher-theologian John Scotus Eriugena or in the Cardinal Nicholas of Cusa. These influences found themselves in the thought of the Waldensians and Stedinger—both called *Luciferians* by the Church—and in the Brethren of the Free Spirit, led by the likely-alchemist and Hermeticist, William Aurifex. Many of these heresies, perhaps especially the Free Spirit, also owed their existence to natural philosophy and natural magic, such as the Greek *physikoi* and Hermeticism. Anabaptism, which had centered on the rejection of infant baptism and the voluntary baptism of adults, had become an especially prominent belief system among proto-Protestants, and was behind many of the peasant revolts. Views such as Biblical unitarianism—the antitrinitarian view that Jesus was not God incarnated— and universalism—the eschatological belief that everyone goes to Heaven— were being met with millenarian beliefs informed by people such as Joachim of Fiore that suggested that a new millennium would be brought about, making the holders of these beliefs particularly antsy to see an end to feudalism.

[1379] Rocker[1]

Not all of the Radical Reformers were necessarily Anabaptists or Protestants. There were also radical reformers from within Catholicism, especially as inspired by sodalities and confraternities such as the Free Spirit, the Beguines and Beghards, and the Friends of God, who would become associated with early efforts of Catholic modernism. Modernist Catholics and other radicals did not always get along, either, as with the condemnation by Nicholas of Cusa of the Hussites. Nonetheless, Catholic modernists and the other radical reformers could agree that much change was needed within a largely corrupted Catholic Church. Among the Catholic modernists, the *Modern Devotion*, was the confraternity known as the *Brethren of the Common Life*, founded by Gerard Groote, an itinerant preacher and friend of John of Ruusbroec. The Brethren of the Common Life lived together in communal households where they studied, ate in common, and worked together. They became well known for their schools and libraries. The Brethren of the Common Life would have both Radical Reformation and Moderate Reformation elements, having radicals such as Nicholas of Cusa and Ramon Llull and moderates such as Erasmus and Martin Luther. Martin Luther would become the focus of the Moderate Reformation, while the humanist Erasmus rejected the violence between both Protestant and Catholic.

Most of these heretics may be considered a part of the proto- or the Radical Reformation, which must be distinguished from the Moderate Reformation of Martin Luther and John Calvin. Proto- and Radical Reformation thought, as well as pagan natural philosophy and natural magic, would develop into the radical side of the Scientific Revolution by way of people such as Giordano Bruno and Paracelsus, both described as pantheists, and Berardino Telesio, whose natural philosophy would influence the pantheist Tommaso Campanella (as well as Bruno).

Holy Crusaders and Inquisitors

The *Crusades* were largely wars on infidels to the Catholic faith, such as upon pagans, Jews, and heretics. The first of the Crusades had actually been the *People's Crusade*, led by Peter the Hermit and Walter the Fearless (better known mistakenly as Walter the Penniless), a popular crusade of commoners. *Popular crusades* are distinguished from the *official crusades* sanctioned by the Church, and included also the Children' Crusade, both Shepherds' Cruades, and the Crusade of the Poor, typified by untrained armies acting on their own accord.

The People's Crusade involved millenarian beliefs inspired in part by natural events such as eclipses and meteor showers. Peter himself was a monastic figure known to wear simple clothes and to ride a donkey. The People's Crusade caused problems especially for Jews, but also for others who had to stand their presence, before it was crushed by the Turkish forces. The People's Crusade was the prelude to the First Crusade, among nine or so that are numbered, many other crusades being identified since that time.

The *Rhineland Massacres*, during the Peoples' Crusades, were pogroms against Jews, who were considered to be enemies of Christianity— in fact responsible for the death of Jesus Christ— and homeland enemies at that, nearer than the Muslims in the East. As well as being seen as the murderers of Christ, the Jews were in fact beneficiaries of *usury*—lending at an unfair gain to oneself, as with interest on monetary loans—, putting Christians into debt. Christianity typically forbade usury, and even long before that usury was described as *chrematistics*—making something from nothing—by Aristotle. As Aristotle himself had said, "usury is very justifiably detested, since it gets wealth from money itself rather than from the very thing money was devised to facilitate." He says, "of all the kinds of wealth acquisition this one is the most unnatural." Concerns regarding usury had already been concretely established in Western culture. Jews were also suspected of poisoning wells, blood libel, and human sacrifices. Some have traced anti-Semitism to Godfrey of Bouillon, who is said, by Solomon bar

Simson, to have sworn to avenge the blood of Christ by exterminating the Jews. Godfrey of Bouillon may have participated in pogroms himself if not for having been ordered not to. Godfrey denied the claim that he wanted to kill Jews, however. Plundering the Jews allowed the crusaders to stock up on supplies. Peter the Hermit is not known himself to have preached against the Jews, but his forces were certainly involved in the plundering of them. The crusaders tended to see any support for the Jews as having resulted from bribery. The Christian burghers would offer refuge to Jews in their homes and even fought against the crusaders at times; the Jews would also find refuge in the castles of favorable nobles. Jews would also be targeted in the other popular crusades: both of the Shepherds' Crusades and the Crusade of the Poor.

The heretics of the Radical Reformation would be put down by crusading knights, particularly those among the Teutonic Knights, Templars, and Hospitallers. The Livonian Crusades, Prussian Crusades, and Lithuanian Crusades, among a number of other Northern Crusades, were set about to convert pagans, while the Albigensian Crusade, Bogomils Crusade, Bosnian Crusades, Hussite Crusades, and Walensian Crusade were crusades against heretics. However, there were also "political" crusades, such as the Stedinger Crusade and the Barons' Wars. In contrast to the popular crusades, the official crusades mostly involved ecclesiastical control, conquests of Papal, noble, and some mercantile power. Another goal of the Crusades was to clear up trade blockages along the Silk Road into Europe (such as those established prior by the Turkic-Jewish Khazars after the fall of the Chinese Tang Dynasty and maintained by the Seljuk Turks and later the Ottoman Empire, among others). But the general theme of the political Crusades was the importance of protecting the West from the Eastern encroachment, signified especially by the loss of the "Holy Land" to Muslim forces of Turkish and Arab backgrounds. Europe had long sustained repeated encroachments from the East from the Huns, Mongols, Turks, and Arabs along its Easterly and Southerly-most parts, particularly in Slavic and Spanish areas. Many in the popular crusades had considered the Jewish diaspora in Europe to represent further encroachment from the East, and questioned the wisdom of their rulers in extending what was perceived to be certain privileges to the Jews. The Crusades had represented an age-old battle between East and West, and lost ground to the East. Buckminster Fuller says,

> We have seen the Greek Alexander the Great crossing Persia and reaching the Indian Ocean, thus connecting with the Phoenician trading to Asia. A thousand years later the Crusaders—ostendsibly fighting for holy reasons— were the Indian Ocean-Phoenician-Venetian-Veeking power structure fighting the older overland-Khyber Pass power structure over mastery of the trade route between Asia and Europe.[1380]

Fuller also points out that the Romans had done the same thing centuries prior.

The main military might of the Crusades was organized through the holy military orders of the nobles, most prominently among them the Teutonic Knights, Knights Hospitaller, and especially the Knights Templar. These orders helped to fight for the control of Jerusalem as well as against infidels and schismatics at home. The *Teutonic Knights* (of St. Mary's Hospital) were established to aid in pilgrimages, establish hospitals, and to subdue and convert heathens in Europe before the official Crusade. They contained the older Order ot Dobrzin. And they were governed by way of a General Chapter, a collection of involved priests, knights, and "half brothers," who elected a Grand Master. They became a governing aristocracy at one point, but became weakened by Lutheranism. The *Hospitallers*— Knights of the Order of the Hospital of St. John of Jerusalem or the Knights of Malta— were founded in Jerusalem for charitable purposes, especially related to hospitals, by Gerard Martigues. They had sovereign lands for some time. Some of the Hospitallers took some part in the Reformation. The Order

[1380] Fuller, 71

includes Protestants but some are Catholic. The *Knights Templar*—the Order of the Poor Knights of Christ and the Temple of Solomon— was founded in Palestine by Hughes de Payens and others. The Templars were the main Crusaders tasked with taking the Holy Land from the infidels, followed by the Hospitallers. Ordoric Vitalis maintained that the future king of Jerusalem joined the Knights Templar. They were supposed to protect pilgrimages, and its knights had oaths to chastity (similar to Cathars), obedience, and poverty. Its governance had majority-rule on major issues but otherwise the Grand Master maintained authority. The Templars became very powerful with a lot of land and castles, had their own churches, were free from tithes and taxes, and became their own ecclesiastical society. Most importantly, they were becoming an important international banking power, but were known throughout Europe as a charity as well as a religious military order. Because of their immense power, royals and other nobles plotted against them. Jacques de Molay, a Grand Master, was eventually tortured and then burned at the stake as a heretic after renouncing his forced confession. The fall of the Templars allowed the Crusades to lose ground and Eastern Europe to fall to the Turks.

The religious military orders, especially the Templars, are culturally important for a number of reasons. They may have been an important means of conveying more Easterly religious beliefs, like Hermeticism, Kabbalah, and Gnosticism, into Europe and on to Europeans. They were something of an elite counterculture, which would go on to inspire rebellious elites on into today. And they were very powerful, despite never having established a sovereign government of their own, having instead created a Christian banking empire that would be rivaled only by later "Court Jews" and Protestant bankers. The Templars maintained practices such as offering demand notes in exchange for local currencies, the demand note then being able to make purchases from within their larger network. This allowed travelers a means to better secure their money. It allowed Templars to compete with Radhanites.

When the crusading nobles came home from the crusades and their castles were occupied by appointees who refused to give them up, on the grounds that they were now the owners by way of occupancy, use, and defense of them (squatting), and so held allodial title to them, the common law agreed. The nobles appealed to the King, who established courts of chancery and chancellors to deal with the matters by way of the particularistic means of equity.[1381] It was Edward I, a Norman son named after an Anglo-Saxon, and the originator of parliament, who introduced the courts of chancery and equity laws. *Courts of equity*, or *courts of chancery*, were courts that dealt with petitions to the King, who delegated his authority to a chancellor, to settle issues where common law consequences were considered to be insensible, especially as it related to bookland. Equity was considered distinct from legality. It was not legislative, but established precedents similar to common law. The equity courts could do things common law courts could not, such as forbidding or commanding certain actions, as in acts of *subrogation*, the stepping into the shoes of the offending party to recover damages. These courts could not change the ownership situation as it had come to be under the common law, but could command the appointees to act with fiduciary duties such that the equity of the asset belonged to the nobles as beneficiaries. From these courts, then, developed conceptions of trusteeship and fiduciary duty, and increasingly the clergy took upon themselves trusteeships to further ensure matters followed the terms of the trust. This was an early form of positive and particularist applications of law that was not entirely appreciated. In fact, the power of the chancery and that of the courts of equity was challenged by Edward Coke in his *The Institutes of the Laws of England*, who suggested strict adherence to the common law instead, pointing to the discretionary powers of chancellors. In *Commentaries on the*

[1381] Legal particularism is a non-native important into Europe, which has long preferred a universalist approach to law systems. *Particularism*, as opposed to universalism, holds that there should be exceptions made for favored special interest groups. An example of this is anti-Semitism legislation which serves to protect Jews from criticism. Legal particularism is the source of all legal privilege.

Laws of England, William Blackstone also pointed out concerns relating to the discretionary power of chancellors, though he acknowledged a need for courts of equity. Others, such as F.W. Maitland, A.H. Chayton, and Paul Brand, have made similar observations closer to our own time. Still, equity was essential to the development of guarantees, trusts, insurance, bills of exchange, and other such institutions and instruments. Edward I had given Jews their own courts, the Exchequer of the Jews, but eventually put restrictions on their moneylending. Jews in England would be known as *servi camerae regis* (servants of the king's chamber).

Coinciding with the Crusades, and occurring during a time of climatic cooling, was the *Black Plague*, a ruthless bubonic plague epidemic that wrecked much of Europe. *Bubonic plague* is caused by bacteria that causes a swelling of the lymph nodes, among other flu-like symptoms, and is easily spread. Armies were known to catapult plague-ridden corpses at their enemies. The Mongols having done so is one possible reason for the spread of the Plague. However, it may be possible that it was purposefully released first in Malta. The *bulboes*, or infected lymph nodes, have been known to be particularly weaponizable. Illness has long been weaponized.[1382]

The Crusades were ultimately a failure, because land was lost to the Muslims and heretics won out in the Reformation. But the Crusades did succeed at opening up trade blockages for some time, spread knowledge that developed into heresies and radical and liberal politics, helped to dissolve feudalism, and to build cities. The number of lives lost in the process can surely never be counted.

Also coinciding with the Crusades was the Inquisition of the Counter-Reformation. The *Inquisition* was a system of Catholic tribunerals used to sentence the heretics, natural philosophers, Jews, Muslims, and witches of the time to harsh punishments.

The Inquisition is most famous, perhaps, for the prevalence of the use of torture and for its complex torture devices, used primarily to punish heretics and sometimes to extract secrets or confessions from them. Tortures could range anywhere from being put in "the stocks," being branded with a hot iron, being whipped, being hung slowly, burned at the stake, or drowned, being mutilated, being flayed (skinned alive), being impaled or sawed in half, having one's body stretched on "the rack," having one's limbs broken and weaved into a wagon wheel's spokes before being put to bake in the sun and be eaten by birds, having one's eyes burned out, having one's tongue removed or nailed to a stake, and more. This was a clear and public disregard by the Church and state for one's body and soul, and that was the point to be made. Executioners often wore masks so as not to have their identity known by the public. Nonetheless, executioners were also seen by some as healers, particularly by those who would stand by waiting to buy blood from the executioner for drinking, a habit especially common to epileptics and not at all uncommon for the time.[1383] Many heretics who were marched to their deaths on the gallows, stake, chopping block, or etc. preached their heresies along the way. Seen by many among the crowd as pious and good Christians who were being executed without good reason in the most vicious and cruel of ways, this became a problem for the authorities because movements among the commoners would develop around the public outrage that was inspired.

[1382] Hittites drove sick people to their enemies, as with those infected with *tularemia*. Scythians were known to dip their arrows into corpses, causing *tetanus*. George Washington would quip that he was not surprised that a smallpox epidemic broke out at the beginning of the American Revolutionary War, and had his soldiers inoculated. Biological warfare is also well-documented against the Native Americans

[1383] Even Paracelsus, while not necessarily an advocate of executions, believed medicinal cannibalism to be a potent means of healing. This was a very common belief at the time, held according to the principle that "like attracts like" or "like heals like"

Especially concerning for the Inquisition had been the growing popularity of Catharism, among the myriad of other heresies. Catharics stood in direct contrast to Catholics, though the Cathars simply referred to themselves as *Good Christians*. They were otherwise known as *Albigensians*. The *Cathars* were metaphysically dualist Gnostic deists, believing there to be two counterveiling forces of existence, the evil god of the *Old Testament*, Satan or the Demiurge, and the good god of the *New Testament* with which Christ was affiliated. Cathars held that the spirit was androgynous, but that it had been given a sex by the evil god. They believed in reincarnation.

Perhaps Cathars themselves, or else otherwise gnostics of sorts, the Knights Templar and other mystical orders of the nobility would also be condemned by the Inquisition, as would pagans of many kinds and those accused of witchcraft, but also atheists who denounced religion altogether or scientists who'd taken to too much philosophy. Inspired by Joachimite millenarianism, Tommaso Campanella attempted to form an egalitarian community, for which he was tortured on the rack. Mennochio, a self-educated miller, had declared in his trial that "God has given the Holy Spirit to all, to Christians, to heretics, to Turks, and to Jews; and he considers them all dear, and they are all saved in the same manner." He decried the use of Latin in court as a crime against the poor, and the Church as a business. He would be burned for his views. Herbalists and other natural magicians such as Narbona Dacal were burned at the stake. Famously, Nicolaus Copernicus and Galileo Galilei avoided being executed for their scientific achievements, though they were silenced from popularizing their ideas. Giordano Bruno would be burned at the stake, however, for his pantheistic beliefs and his cosmological views that the stars were suns burning like our own and had planets with life on them. Lucilo Vanini had been convicted as an atheist despite his not having been one, and his tongue was cut out, he was strangled, and then his body burned. Pietro d'Abano was tried for atheism due to his astrological beliefs. Crypto-Jews and Crypto-Muslims would also be punished by the Inquisition, as would pagans. Groups such as the Benandanti, for instance, represent relict, Neolithic pagan fertility cults. They believed that being born with a membrane covering one's head, as members of the cult were, provided nocturnal and spiritual powers that allowed them to shapeshift and travel into the spirit realm to battle evil spirits, representing the forces of plenty against those of shortage.

Others besides heretics were also tried and punished along these lines, sometimes under the authority of the Inquisition but not always. Among these were either truly vicious heretics or those who were forced into admission of guilt for crimes of which they were innocent, by way of torture. Many historians suggest that there were many lies told about people, leading to their conviction and execution, while others hold that these are true stories, something agreed upon also by some also-divided anthropologists. Some of the heretics were political problems rather than religious problems. For instance, Matthias Klostermayr, the Bavarian Robin Hood, was broken on the wheel. Heinrich Dolle had been executed by way of the breaking wheel for the aggravated murder of a Jew. But others were considered to be werewolves, sorcerers, cannibals, or so on. Angele de la Barthe was accused of having been a witch who had sex with the Devil and bore a child with a hairy face and a tail, having raised it on babies she killed for it. She is cited at times as among the first to be put to death for witchcraft during the Inquisition. Blaise Ferrage lived in a cave in which he lured peasants and ate them, for which he was broken on the wheel. Sawney Beane, his wife the witch Black Agnes Douglas, and their large multigenerational, incestuous family, or clan, were caught living in a seaside cavern littered wth drying and pickled human bodyparts and wealth accumulated from highway victims, perhaps having eaten as many as a thousand or more individuals over a period of twenty-five years or so. Sawney, his wife, fourteen children, and thirty-two grandchilren and incest-conceived children by way of his elder children, were all executed. In the search for them, innocent had been hung, but crimes had continued. One of the Beane daughters is said to have escaped, top have planted a tree called the *Hairy Tree*, from

which she would later be hung. Peter Stumpp was a wealthy farmer who had been accused of lycanthropy, black magic, and cannibalism, including the eating of fetuses removed from women. For this, he would be placed on the wheel, defleshed with hot pinchers, smashed, decapitated, and burned with his already-flayed and strangled mistress and daughter. Other werewolves included Gilles Garnier, Henry Gardinn, and the tailor Nicolas Damant. Peter Niers had been broken on the wheel before being drawn and quartered for having been a serial killer, including for his eating of fetuses taken from women, being known as a black magician and shapeshifter. A wealthy cave-dweller named *Christman Genipperteinga* had been known for maintaining a sex slave and for serial killing and robbery, as well as infanticide, and was also broken on the wheel for his misdeeds.

Skeptics have declared that, for the most part, stories of witches and werewolves and such things are complete fabrications that were established for the sake of political or—what is the same— religious ends. Along with Siamese twins and deformed people, however, the Renaissance naturalist and collector of curiosities, Ulisse Aldrovandi, in his *History of Monsters*, has a number of drawings involving *hypertrichosis* of different types, as well as hermaphroditism, and depictions of prehistoric skeletons, but also creatures like werewolves, centaurs, and satyrs. Aldrovandi, a very serious naturalist, had coined the term *geology* and his combined interests of geology, zoology, and botany appears to have anticipated paleontology, though he is generally regarded as a natural historian instead. He'd gained these interests while being punished for his own heretical Anabaptist beliefs.

The onset of the Crusades and Inquisition would be followed by the Hundred Years' War, a military conflict between France and England over the title to the French crown. The King of England had been the son of the Queen of France, and so when the King of France died he had tried to claim the throne from his cousin, Phillip, who would be crowned King. The English King had himself been French, and the English ruling class at the time had been French-speaking, the Normans having displaced the older Anglo-Saxon ruling class.[1384] The English King also had claim to duchies in France, but had to pay homage to the French King. Edward refused and started raiding France, claiming it as his own, beginning in Ghent. The conflict between France and England would last over a hundred years, with intermittent periods of peace. The English had an advantage early on, having perfected the use of the long bow by archers. But eventually, following the example of the Hussites, the French would gain the advantage through the use of gunpowder for cannons. The introduction of the longbow and cannons represented a move away from codes of chivalry and toward modern warfare. The Hundred Years' War also saw the emergence of strong sentiments of nationalism, and of a divide between the Gallo-Romantic, or Celtic-Roman, and Germanic languages, with some synthesis in nations such as the Belgians, Flemish, and Swiss.

The Renaissance

The *Renaissance* was a time of great cultural pronouncement, which looked back with nostalgia to the antiquity of the ancient or classical societies, such as Ancient Greece, the Roman Republic, and Ancient Egypt. Literally, the word means "rebirth," referring to the rebirth of Europe (from the Fall of Rome). Accompanying and supported by the rising merchant economy in Italian communes and republics, and the naturalistic theology of Nicholas of Cusa from Germany, the Renaissance was a period of appreciation for human achievement. It was humanist in outlook, and expressed itself through the humanities, particularly in the liberal arts and architecture, in philosophy, mythology, religion, and in politics. The Renaissance would lead to major changes in the West and then the world.

[1384] Anglo-Saxon royalty, it is interesting to note, may have been primarily vegetarian, reserving meat consumption to gifts from the peasantry, as per the studies of Sam Leggett

The Renaissance would usher in an interest in esoteric and mystical religious and philosophical, as well as more scientific and humanistic, beliefs. Margaret C. Jacob, in her *The Radical Enlightenment: Pantheists, Freemasons, and Republicans*, writes that the "so-called 'dark side' of Renaissance humanism, that is the search for an immediate comprehensive understanding of nature, encouraged magical and animistic speculations, in conjunction with the extreme individualism so characteristic of the magician," and that "paganizing and anti-Christian tendencies within this magical Neo-Platonism were all too clear, and its devotees went on, in some cases, to embrace Cabalistic learning or to search the supposedly ancient writings of the Egyptian priest, Hermes Trismegistus, for the key to this ancient wisdom, for *gnosis*, an immediate and direct comprehension that would unlock the secrets of nature."[1385]

The Renaissance would inspire a more liberal, mercantile economy, and republican governance, but also absolutism in politics. Rudolf Rocker paints the Renaissance in a positive light, when he says that

> As most of the thinkers influenced by humanistic ideals saw in the individual "the measure of all things," they recognised society not as a definite organism obeying its own laws, but as an enduring union of individual men who for one reason or another had associated themselves. From this arose the idea that the social life of men was founded on a definite contractual relationship, supported by ancient and inalienable rights which had validity even before the evolution of organised state power, and served as a natural basis for all communal relationships of men. This idea was the real core of the doctrine of natural rights which again began to flourish at that time.[1386]

While republicanism was gaining in interest during the Renaissance, especially in the communes, the monarchical system was transitioning to absolutism. Under absolutism, the monarch answered to no other authority, including the Church. The power of absolute monarchs was justified not by their being vassals of the Church or Emperor, but by claim to the "divine right of kings." Under absolutism, all power answered to the monarch. Fealty arrangements ceased, and monarchs demanded more and more that their nobles live in the royal palace, so as to be made dependents of the monarch. In place of fealty, mercantile arrangements would be made. Rudolf Rocker says that

> The Renaissance, with its strong pagan tendency, reawakened men's interest in earthly affairs and again turned their minds to questions which had scarcely been discussed since the decline of the ancient civilisation. [...]
>
> Interest in the natural phenomena of life again directed men's attention to the social groupings of people, and thus the old ideas of natural rights were revivified. While the ever encroaching absolutism strove to confirm its power by the doctrine of the divine right of kings, the whole-hearted and half-hearted opponents of absolute state power appealed to "the natural rights of men," a protection also guaranteed by the so called "social contract." Thus, quite naturally, they again approached the question which had already occupied the ancient thinkers and which now received new significance by the rediscovery of the ancient civilisation. They sought to make clear the position of the individual in society and to discover the origin and significance of the state. However inadequate these attempts may appear today, they nevertheless drew greater attention to the subject, and an attempt was made to understand the relationship of the citizen to the state and to the existing rulership of the people.[1387]

[1385] Jacob, 5
[1386] Rocker[1]
[1387] Rocker[1]

Iain McKay, in *An Anarchist FAQ*, tells us that

> in feudalism [...] the land was owned by the feudal lords who exploited the peasantry directly. Economic and political power were merged into the same set of hands, the landlords. Absolutism saw the monarch bring the feudal lords under his power and the relative decentralized nature of feudalism was replaced by a central state.[1388]

Examples of absolute monarch include Henry VIII of England, Louis IV of France, Leopold I of the Holy Roman Empire, and Peter I of Russia. The list continues, of course.

While the European system was shifting toward absolute monarchy, there were also changes being made on the lower levels of society. Daniels and Hyslop say that while other areas of Europe had "had lords who were dependent on agriculture, Italy had towns that produced textiles and luxury goods," and that by "the Renaissance, the country was broken into about 250 separate city-states" that had been "nominally under the control of the Holy Roman Empire," though they had "resisted the rulership of emperors and kings and fought each other for power and control." In such conflicts of power, "wealthy merchant families like the Medicis and Borgias rose to power and became patrons of the arts." Meanwhile, "the intellectual movement known as humanism [...] espoused the study of human nature and a revival of classical learning."[1389] The thinkers who had set off or influenced the Renaissance included Petrarch, considered to be the "founder of humanism"; Giovanni Pico della Mirandola, whose *900 Theses*— which was a highly-synthetic humanist synthesis that drew from Plato, Aristotle, Kabbalah, Hermeticism, and melded it with Christianity— came to be known as the "manifesto of the Renaissance;" Marsilio Ficino, a neo-Platonist thinker; Erasmus, the "Prince of Humanism;" Poliziano, a poet and scholar on Aristotle; Marsilius of Padua, the anti-authoritarian republican; and François Rabelais, considered an early free thinker and the inspirant for the concept of *Thelema* later adapted by neo-Thelemites like Aleister Crowley.[1390] Leonardo da Vinci is often portrayed as *the* "Renaissance man," the man who mastered the humanities as well as naturalism and mechanics. He is often glorified as the prime example of what would later develop into modern science and engineering. Probably inspired by the Hussites, he designed an armored fighting wagon. Michaelangelo, Leonardo's contemporary and rival, was a Florentine republican who had helped in the efforts against Medici control.[1391] Machiavelli, the famed political philosopher, also fits into the picture of the Renaissance. Other important humanist thinkers of the time of the late Renaissance and early Reformation period included the Unitarians, such as Piotr of Goniądz, a peasant and pioneer of Anabaptism, and a pacifist who opposed serfdom; Fausto Socinus, founder of Socinianism; Michael Servetus, praised for his radical search for truth and freedom of conscience, burned at the stake; and Jacob Palaeologus, who had nearly been burned at the stake, but was instead beheaded. Perhaps the most important of the Renaissance men was Nicholas of Cusa, often seen as a source of Renaissance interest in science and an advocate of naturalism. Gerald Rose, in "The Venetian Takeover of England: A 200-Year Project," says

---

[1388] McKay, 147

[1389] Daniels and Hyslop, 162

[1390] Rocker says, "A great advance was made by the French Humanist, Francois Rabelais, who in his novel, Gargantua, describes a small community, the famous Abbey of Theleme, of wholly free men who had abolished all compulsion and regulated their lives simply by the principle, 'Do what thou wilt.'

> ... because free men, well born, well educated, associating with decent company, have a natural instinct that impels them to virtuous conduct and restrains them from vice which instinct they call honour. Such people when oppressed and enslaved by base subjection and constraint forget the noble inclination to virtue that they have felt while free and seek merely to throw off and break the yoke of servitude; for we always try to do what has been forbidden and long for what has been denied."

[1391] Da Vinci painted a piece for the new Florentine republic, demonstrating his republicanism as well

that "[m]odern history commences with Nicolaus of Cusa [...] and the Italian Renaissance that Cusa and his collaborators inspired."[1392] Cusa was also important for setting limits upon Renaissance paganism, ensuring that Christianity had a way to humanism as well.

The Renaissance had been funded by a growing middle class merchant economy. Wars such as the Crusades and the Hundred Years' War, as well as disasters such as the Black Plague, had killed off a large number of the population of Europe, and oftentimes had not discriminated between noble and peasant. This left a lot of unclaimed property, including entire manors, which the common classes could then squat claim to for their own, becoming yeomen who farmed their own land, or even communards of a commonly-used manor house. Daniels and Hyslop remark that stability and abundance "led to the development of larger towns," and that "peasants could sell surpluses to eventually buy their freedom," as "serfs simply slipped away from the manor and became mercenaries or set themselves up as free peasants." Under these conditions, "landowners found it more profitable to hire day laborers to do their work than to maintain a peasant and his extened family; over the next few centuries, the feudal system began to fade."[1393] In this way, the middle class of property-owning smallholders, artisans, and merchants grew.[1394] And along with the growing middle class came a new economic system. Leon P. Baradat, in his *Political Ideologies*, writes that the "prevailing system in Europe during the fifteenth and sixteenth centuries was known as *mercantilism*."[1395] Mercantilism had started in mercantile republics in Italy, where merchant and artisan republics had blossomed, and was prominent among the later republics. It highlighted the capitalism that had always lurked within feudalism. Mercantilism is situated between the end of feudalism and the rise of capitalism and market economies, and was characterized by an increased importance of private market activity, which was often sponsored by royality or republics. It was characterized by exclusive monopolies being granted to private or corporate interests by nations in order to enhance their political power, and by the growing control of private banking interests. Baradat says that "each country attempted to accumulate as much of its adversary's wealth as possible through international trade." He says that this "wedded politics and economics," because to "control the flow of money, monarchs tended to grant trading and manufacturing privileges to only some of their subjects, thus creating a highly regulated and monopolistic economic system," and so the "favored people were allowed to produce goods, others to ship them, and so forth. While this system benefitted a few fortunate people," he says, "it harnessed large numbers of others, preventing them from achieving their economic potential."[1396]

Mercantilism had depended upon banking, and Italian bankers were becoming increasingly influential. Important bankers in Italy included Acciaiuoli, Mozzi, Bardi, Peruzzi, and Medici. Spanish Jews such as Mendes would become important bankers, too. Germany had the Fuggers, Welsers, and Rothschilds. Eventually the Bank of Amsterdam, the English Royal Exchange, and the Bank of England would develop, as well as Swiss and Scottish banking. Jews, pagans, and others had started merchant banking in Lombardy, bringing many practices from the East passed along the Silk Road. The use of double-entry bookkeeping, such as promoted by Luca Pacioli (and later used in Mutualist philosophy on banking as well), and the growing importance of banking families such as the Medicis, would actually

[1393] Daniels and Hyslop, 129

[1394] This middle class would eventually gain much economic influence and political power during the Enlightenment. Their Republic of Letters, salons, coffee houses, fraternities such as the Freemasons, and political ideologies such as liberalism and republicanism, would become politically significant, and would come to overthrow monarchies and the feudal order, to replace them with republics and capitalism, thus ending the Medieval period and moving toward Modernism.

[1395] Baradat, 70

[1396] Baradat, 70

drive much of the most famous accomplishments of the Renaissance. Bills of exchange evolved from merchant fairs, where hard currencies were traded in for notes that could be spent at a later date. Goldsmiths of London accepted desposits of gold and issued receipts. Eventually they lent the receipts out on behalf of patrons, as promissory notes. Occurrences such as these would contribute to our present notions of money and banking.

As Anthony Migchels has said, there was bad credit scarcity in the Middle Ages and Renaissance, owing to metallism and the absence of mutual credit, which is what allowed the usurers to justify their usury. During the Renaissance, some Jews would come to be known as *Court Jews*, as it was common for royal courts in Europe to have participating Jewish bankers, some of whom would put even the nobility into debt. Jews were forbidden from owning land and participating in the guilds. Jews, as well as pagans (which included some of the Renaissance Italians), could practice usury and the buying of futures, however, unlike Christians, and made sure to underwrite their bargains with insurance as well. Naturally, Jews, along with some pagans, established themselves as lenders to gentiles. Due to the scarcity of money imposed by metallism and seigniorage, and met by the absence of credit, this was seen as a service! Thomas Greco reminds us that[1397] "[m]ost of what today is called *interest* is actually usury. Three of the world's great religious traditions, Judaism," which had maintained laws opposed to lending to fellow Jews at interest, "Christianity, and Islam, all have prohibitions against the practice of usury. Of these," he says, "only Islam today makes much of an issue of it, though the current opposition seems generally ineffective and appears not to be taken very seriously except in the more fundamentalist circles.[1398] Using letters of credit, the Radhanites had exchanged value across vast areas, anticipating later banking practices. The influence of merchants, such as the Radhanites, had been a major force contributing to the rise of what would become mercantilism and banking as it would come to be practiced in Europe. Some Catholics, however, would respond to Jewish usury with programs such as the Mount of Piety, which would make moderate-interest loans available in acts of apparent charity. Catholic opposition to usury would cause problems, however, particularly when set into law, because usury did not owe its existence to a prior lack of laws and enforcement against it, but instead to regulations that imposed metals stamped by the government as legal tender. Anti-usury laws only served to privilege the otherwise downtrodden Jews as financiers, resulting in persecution of the Jewish people as a race of usurers. Interestingly enough, because of the mechanics of supply and demand, the elimination of anti-usury laws and of legal tender laws would have resulted in a drastic reduction in usury. Unwittingly, the royals and the Catholic Church established the conditions by which the middle classes could later displace them.

Catholic reforms and Protestantism would free Christians from some of the restrictions the Catholic Church had put on usury, and Protestants and Jesuits had especially started to compete with Jews in providing banking services. Some nobles lost lands to bankers. Other times, bankers would gain privileges in return for their loans. One such example of this is the founding of the Bank of England. A Scotsman, William Patterson, had put the king, William of Orange, into debt in order to fund his war. In

---

[1397] Greco makes a distinction between interest and usury that Mutualists do not always adhere to

> It is undeniable that there *are* costs associated with the act of lending. In historic times, these might have included the cost of transporting and safeguarding the gold or silver money, the cost of drafting and legally registering the loan contract, and the cost of insuring against default. In modern times, there are similar 'loan placement' expenses. It is entirely reasonable and equitable that the borrower should be asked to bear these costs. Thus, interest became an allowable exception under Canon law, since it was seen, not as profit, but as compensation for loss or expense. (Greco, 166)

[1398] Greco, 164

return, the Bank of England received special privileges as a banking monopoly. During mercantilism it even became easier for private bankers to put royalty into serious debt.

Corporate interests such as the East India Tea Company gained some political influence during this period, too.

Merchants had developed their own systems of contract law, called the *Law Merchant*, which would enforce laws that governments wouldn't. Harold J. Berman says that as it is "with feudal and manorial law, so with mercantile law the crucial period of change" occurred when "the basic concepts and institutions of modern Western mercantile law—*lex mercatoria* ('the law merchant')—were formed," and that "it was then that mercantile law in the West first came to be viewed as an integrated, developing system, a *body* of law." He says that

> there occurred a rapid expansion of agricultural production and a dramatic increase in the size and number of cities. At the same time there emerged a new class of professional merchants, who carried on large-scale commercial transactions both in the countryside and in the cities. It was primarily to meet the needs of the new merchant class that a new body of mercantile law was developed.[1399]

Mercantile law would develop alongside urban law, both of which oftentimes ran contrary to the wishes of the upper clergy and nobility, and to the favor of gentrymen, merchants, and other burghers. It started to foster a capitalist counter-economy that ran contrary to the official economy of the Church and feudal state. Bruce Benson tells us that "the Law Merchant developed outside the constraints of political boundaries and escaped the influence of political rulers for longer than many other Western legal systems," and that, for this reason, "it provides the best example of what a system of customary law can achieve."[1400] He says that the "reciprocity necessary for the cognition of commercial law arose due to the mutual gains generated by exchange," and that the "Law Merchant evolved into a universal system through a process of natural selection." Further, participants would "*voluntarily* enter into a contract," and so it "becomes clear why the Law Merchant had to be objective and impartial. Reciprocity in the sense of mutual benefits and costs," he says, "is the very essence of trade."[1401]

Again, as is perennially the case, mutuality is at the heart of the transition of power that would ultimately result from the displacement of feudal and religious authority by the new capitalist republics of the *bourgeoisie*. Inspired by the rebellions of the lower classes, and informed of wisdom being passed along the Silk Road and within Europe after the Crusades and Mongol invasions, the *bourgeoisie* and their sometime cohorts— the lower gentry and upper yeomanry— did what they could to assert their power and advance their interests.

Nolan and Lenski state that, before mercantilism, "the absence of significant commercialization" meant that "most of the intrasocietal conflict in simple agrarian societies was *intra*class." They say that "the governing elite" would compete and even war with one another while peasants competed with one another over farmland. However, they say, what was rare was "conflict *between* these classes," and that wars were "conflicts among elites, not between elites and peasants, and replacement of one elite by another often had little effect on the lives of peasants." They suggest that "the classes lived in different worlds," and that "control and taxation by elites may have seemed as natural and inevitable to peasants as the seasons themselves." However,

---

[1399] Berman, 333
[1400] Benson, 30
[1401] Benson, 32

> Commercialization had the power to change this dramatically. Not only did a wealthy commercial class itself constitute a potential threat to the power of an aristocratic governing elite, but the introduction of commercial elements into the rural economy could trigger violence. If elites, in order to better meet their financial obligations, demanded higher rents, greater shares of harvests, and more burdensome services from peasants, they undermined the traditional order on which their control rested, and this could spark peasant rebellions.[1402]

The growing class of merchants and the engagement in business and law by the gentry, yeomen, and burghers—not to mention the financial power of the growing class of "Court Jews" and merchant bankers following after Jacob Fugger and the Medicis— was beginning to threaten the established powers of the Church and state.

Mercantilism would change the nature of the guilds, and not always for the best. For instance, Cohn writes that industry was not merely composed of "small workshops in which the 'master', himself a man of modest means and no great ambition, exercised a benevolent patriarchal supervision over some three or four assistants and apprentices who together formed almost a family group," but that this idea "is valid only for the industries which produced for the local market," whereas those that "made goods for export [...] had their economic basis in a rather primitive form of uncontrolled capitalism." He says that "in the great cloth industry it was merchant capitalists who provided the raw materials and who owned the finished product, which was sold in the international market."[1403] These merchant capitalists had become especially established along the Silk Road and were often involved in negotiations with trade blockaders in more Eastward locations, such as by Mongols, Turks, Khazars, or etc. Merchants establishing themselves as middle men to the East became especially problematic for weavers and others in the textile industry, becoming essentially absentee employers to weavers in cottage industries (home production).

Alongside mercantilism, the process of enclosure had begun, in which common land was privatized and ceased to be common land, as it had traditionally been and as it was under the "open field system." During the Middle Ages, few people claimed to have a private title to land; most of the land was instead held in common, with individuals having certain use or possession rights, often having to pay a rent for a given plot of land (or having to perform *corvée* labor, etc.), and not actually owning the land.[1404] Enclosure was a departure from this traditional system of open field tenure, and resulted in the increase of tenant and private landlord relations. Such a practice was compared to cannibalism. John Norden, for instance, suggested that those who would go about enclosing the land of a peasant would just as well "eat his flesh like a cannibal." A Puritan with the last name of Lickfinger suggested that cannibalism of the sort Norden condemned made the Europeans even worse than savages who would eat only enemy combatants.

During feudalism and especially mercantilism, peasants would express communitarian values. They opposed the gluttony of the nobility and clergy, and the growing individualism of the gentry and burgher classes. Peasants would demand what historians such as E.P. Thompson and anthropologists such as James C. Scott refer to as a *moral economy*; one which is based on moral values and sentiments of justice, a "fair price," instead of the ability to ask a price equal to the full market value (in a regulated market). This moral economy would often be expressed through demands for price controls, which

---

[1402] Nolan and Lenski, 158

[1403] Cohn, 58

[1404] During the Middle Ages, and under feudalism, land would be leased to a noble by a monarch, who would control the land and the peasants on it. Some peasants, called *serfs*, were not allowed to leave without permission, and expected certain obligations to be met on behalf of their noble in regard to governance.

would act as an attempt to keep price-gouging from occurring. Peasants would, at times, riot in order to express their demand for price controls and other regulations to keep the economy—in their eyes—just. They'd also revolt against enclosure. Such sentiments would go on to influence the utopian socialist and radical thinkers of the relative future.[1405]

The Age of Discovery

The *Age of Discovery* marks a period overlapping with the Renaissance, wherein much exploration was occurring by rising naval powers, and in which the existence of new continents were discovered, explored, and then colonized by Europeans, such as the Americas by Christopher Columbus, Australia by Willem Janszoon, and the expeditions of Ferdinand Magellan and James Cook.[1406] Michael Bradley holds that Christopher Columbus, at least, had been a Sephardic Jew who escaped Portugal just in time to evade Jewish repression, or was financed by such, and that he was soon followed by Jewish conquistadors who quickly went about dominating the native populations of the Americas.[1407]

Much of the interest in discovery had been set off years prior, by the journey of Marco Polo, and by a growing interest in classical antiquity. Marco Polo had been a merchant traveler famous for writing a book addressed to the ruling classes of his day, explaining the world of the East, to which he had become accustomed. He, his father, and uncle had travelled along the Silk Road to China, where he was abducted by Kublai Khan for seventeen years. The Khan had become fond of Marco Polo's journalism, and only reluctantly let him return to Europe. Polo's influence on his fellow Europeans would be immense, as his writings provided some of the earliest education material on the ways of the East that many Europeans had received. This would spark much curiosity among Europeans, and would inspire many merchants to duplicate Polo's journey, helping to kick off the Renaissance. In particular, but certainly among other things, Europeans were interested in the silks of China and the spices of India, and eventually gunpowder, as was used by the Hussites. Marco Polo's map interestingly had Alaska on it. Indeed, the Chinese may have been well-aware of the existence of the Americas already. *Fusang*, for instance, was a legendary land spoken of by the Chinese, sometimes attributed to Sakhalin Island or the West Coast of North America, such as California.

Marco Polo had actually been preceded by Jewish merchants, such as Benjamin of Tudela. Radhanite Jews had been very active on the Silk Road,[1408] maintaining a virtual monopoly on spice trading into Europe. Marco Polo's journey served, in part, to challenge this monopoly. In particular, after Polo's influence, the Papal States of Italy would come to find interest in breaking the spice monopoly, as would the Rus. This also influenced later journeys by people such as Christopher Columbus, and would give

---

[1405] But while "just price" doctrine, such as that of Thomas Aquinas, most certainly influenced Mutualism in its anti-usury direction, Mutualists would ultimately come to reject price controls, seeing the competition offered in the freed market— through mutual credit, voluntary cooperation, and federation— as the best means of reducing prices.

[1406] Gavin Menzies suggests that the Chinese admiral Zheng-He discovered the Americas half a century before Christopher Columbus. There may be other contenders, as well. Newport Tower in Rhode Island, for instance, has been considered by some to have been built before the arrival of Columbus, perhaps by Vikings or Phoenicians. William Penhallow has shown that the structure may have been built with astronomical alignments taken into consideration. Andrew Sinclair has posed that the structure was built by a Scottish Templar, Henry Sinclair, who is said to have travelled to the Americas a century before Columbus. But even before that, legend has it that Madoc, a legendary Welsh explorer, established colonies in the Americas.

[1407] See Bradley[1]

[1408] Radhanite Jews would be found in places as diverse as the Rhone River in France and the East Coast of China, and found particularly strong support from the Khazar Empire, a Turkic nation that had converted to Judaism and controlled passages West into Europe from the East. The Radhanites likely had their home in Radhan, a region in Mesopotamia, perhaps in Babylon.

rise to the later Dutch East India Company. But spices, furs, and other pleasantries were not all that was traded on the Silk Road. Radhanites and others would sell male and female slaves, eunuchs, and children.

The Age of Discovery would see the development of colonialism and the establishment of pre-industrial factories across the world, met by an increase also in piracy. Tracing the Age of Discovery from out of the Bronze Age explorations of the Phoenicians through the Venetians and to the Vikings, Buckminster Fuller says that

> ships got out of the Mediterranean and into the Atlantic, around Africa and to the Orient, and then around the world. Thus, "those in the know" rediscovered that the world is a sphere and not an infinitely extended lateral plane. Great battles ensued—waged under the flags of England, France, and Spain—to determine who would become supreme master of the world's high-seas line of supply. The great nations were simply the operating fronts of behind-the-scenes, vastly ambitious individuals who had become so effectively powerful because of their ability to remain invisible while operating behind the national scenery.[1409]

Part of the Age of Discovery involved the spread of the factory system, first established by the Hanseatic League. Prior, colonies were established by Phoenicians, Greeks, and Romans, but factories were different. Factories started as meetings of merchants from a particular location in another state, often as renters, to establish trade relations. Factories might be associated with guildsmen or skilled workmen such as blacksmiths and master millers. Guilds and kontors (trading posts) were a major part of the Hanseatic League, which had its own practices of mutual aid between its cities, themselves having their own law systems. This practice was passed on to the rest of the European countries, such as Portugal, Spain, the Netherlands, and England during the Age of Discovery, who continued with the factory system and spread it across the world, to Africa, India, China, Japan, and South America, trading slaves, gold, spices, tea, tobacco, coffee, sugar, and Oriental products, among other things. Henry the Navigator, a Templar, was among the first of the Portuguese to establish factories, and, in order to attract Muslims to his site, set up his factory in Mauritania. The Portuguese started fortifying their factories in order to dominate the local trade. York Factory served as the *de facto* government in parts of North America, and kept relations with the Native Americans, something the United States would follow in doing in its territories, calling its factories *forts*, such as those often associated with US Cavalry garrisons. Many cities grew around the locations of such factories, such as with Fort Detroit, Fort Chicago, and Fort Green Bay. The East India companies established company rule in India by way of factories. At first, early factories of a modern industrial sort were simply called *mills* as ancient and medieval centers of production, centered around water wheels, had been called. But the introduction of steam power allowed for "mills" of the factories to be positioned away from sources of water. Factories would introduce industrial equipment, such as *spinning mules* for textiles, shifting toward modern industry and a partial reorganization of the factory system along the lines of the assembly line.[1410]

Michael Bradley says,

> Ashkenazi Jews working with the Dutch East India Company invented several legalisms that made it possible for someone to make a great deal of money without actually producing anything or providing any useful service. The idea was basically to give a company all the rights of a living person – so-called 'incorporation'— and none of the obligations. The 'corporate entity' could not ever be taken to jail or

[1409] Fuller, 72

[1410] Which became especially streamlined by people such as Henry Ford come the manufacturing aspect of the Second Industrial Revolution

> executed for anti-social behaviour because it didn't really exist except as a legalism on paper. But, unlike any normal person, a 'corporate entity' could be vital for many decades. The people who owned shares in this sort of company had 'limited liability' for the 'corporate entity's' actions. In short, it was difficult to hold anyone accountable for a company's actions. And that was the whole idea, of course. [1411]

Europeans were generally morally and ethically appalled by the ethnology of the indigenous peoples of the Americas as well as elsewhere, such as in maritime Southeast Asia and sub-Saharan Africa. While Europeans had long embraced clothing and monogamy, and had long-rejected anything other than medical cannibalism as well as human sacrifice, many of the Native Americans, especially those with Otamid lineages, practiced cannibalism or human sacrifice, and often lived life in the nude. The same was true among primitive people across the world. There were exceptions, of course, particularly among the Iroquois, Cherokee, and other tribes considered to have been ancient relatives of the Europeans or at least to have been more civilized. This did not stop most of the ethnographers of the time, however, from painting a picture of Native Americans and other indigenous peoples as savages.

The latter half of the Age of Discovery included the Golden Age of Piracy, wherein pirates, privateers, and buccaneers raided merchant vessels of established Empires. These sea robbers and maritime mercenaries, many of them Jewish, Moorish berbers, remnants of the Knights Templar or Rosicrucians, mutineers, escaped convicts, criminals, or outlaws fleeing the law, draft dodgers, runaway slaves, or adventurous opportunists taking advantage of privateering sanctions, could come from many different walks of life, including minority groups and *déclassé* or renegade aristocrats, but was generally composed of members of the commoner classes of society, such as defective navymen or marines, ex-merchant *bourgeoisie*, ex-dockworkers, and others, or by slaves turned freedmen by their acts of piracy.

Slavery had been common in European society since ancient times, particularly in Mediterranean maritime societies such as in Ancient Greece and Rome. The Danes (Tribe of Dan), Jutes (Judahites, Jats), and other Vikings were known to have participated strongly in the slave-trade too. But it had fallen out of favor and was replaced by serfdom upon the advance of Christianity. As Christianity spread and slavery became less acceptable, the slave trade became largely dominated by Jews (Jutes, Jats) and pagans (Venetians), who'd remained conservative. Many Christians were forbidden by law from slaving, while for others it was simply taboo; however, enough Christians had to participate to drive a market for Muslim slaves, and the Catholic alternative of serfdom would not remain popular either. Jewish pirates and merchants especially, but among others including pagans, Christians, and Muslims, had often engaged in the slave trade along the Silk Road, on the Barbary Coast, and the trans-Saharan trading routes, often selling Christians and Muslims to one another, black slaves to whites and white slaves to blacks. Increasingly, slavery, especially in the trans-Atlantic slave trade, would come to include and become dominated by the presence of black Congoids— or *negroes* according to the Latin root, still prevalent in Spanish and Portuguese—, who, in their native home in sub-Saharan Africa, were late to develop civilizations in comparison to super-Saharan Africans and Eurasians. Along with having a strong presence in roles such as tax collecting and moneylending, Jewish participation in the slave trade became one of the major criticisms used by "anti-Semites."

It is well-known that the American and French revolutions would benefit from solidarity with pirates and privateers— legal pirates—such as the French pirate of the Carribean, Jean Lafitte, and the many thousands of others who participated in the American Revolution. As with the conquest of the Vikings, the American Revolution would require the conquest of pirates. Many of those involved with common law movements today, such as so-called "Sovereign Citizens" and "Freemen on the Land," suggest that

[1411] Bradley[1]

the present federal government is a government of pirates, too, and that it operates under maritime or Admiralty law, which they distinguish from the law of the land.

Despite the hardships and violence of piracy, a utopic element can nonetheless be found among some of the pirates, who might tend to radical liberalism and republicanism, and some were serious revolutionaries. Pirates, privateers, and buccaneers, sometimes belonging to widespread fraternities such as the mostly Protestant Brethren of the Coast (not completely unlike the Victual Brothers guild of privateers long prior), would practice crude forms of insurance, might make policy-decisions democratically, elected or voluntarily subscribed to their captains, and practiced something like a crude form of natural law wherein personal grievences were resolved by way of dueling. They established crude pirate republics inspired by John Locke and Thomas Spence, loose confederacies such as the Republic of Pirates, lived by the Pirate Code that demanded democracy, elections, and profit-sharing, and maintained Radical Reformation ethics similar to those of the Ranters. Pirate systems of checks and balances predate those used in the United States. Captain James Misson and Thomas Tew are said to have formed a pirate utopia called *Libertatia*. Jan Janszoon had similarly formed a pirate republic, the *Republic of Sale*. Zaporizhian Sich is sometimes defined as a pirate republic as well. Some stranded pirates are said to have formed a society they called the *Republic of Spensonia*, named after a fictional community imagined by the radical Thomas Spence. Port Royal is sometimes described as a pirate utopia, before becoming a place known for their execution. Captain Bellamy, known for his compassion, is quoted as having said to a defeated Captain Beer in an apology for Beer's not being granted a ship by vote of Bellamy's crew, that the authorities "vilify us [...] when there is only this difference [between us]: they rob the poor under the cover of law [...] and we plunder the rich under the protection of our own courage."

The Age of Discovery concluded with British maritime dominance. The efforts of the British East India Tea Company would come to fruition with British command of the East Indies. Buckminster Fuller tells us that, "in 1805, 200 years after the founding of the East India Company,"

> the British won the Battle of Trafalgar, giving them dominance of all the world's lines of supply. They now controlled the seas of the world. It was said by world people that the British Empire became the first empire in history upon which "the sun never sets." In order to get their gold off the sea and out of the reach of the pirates, the British made deals with the sovereigns of all the countries around the world with whom they traded, by which it was agreed from then on to keep annual accounts of their intertrading and at the end of the year to move the gold from the debtor's bank in London to the creditor's bank in London to balance the accounts. In this way they kept the gold off the ocean and immune to sea pirate raiding. This brought about what is now called the "balance of trade" accounting.[1412]

Bradley says, regarding the corporate system that coincided,

> Profits derived from investment in such 'corporate entities' operating in European colonies founded the great Jewish banking houses of Kuhn, Loeb, Warburg and others, including the better known Rothchilds. Often directing company policies as major shareholders, and then loaning money at interest so that corporations could afford to carry out their policies, these banking houses, always allied by inter-marriages, made immense 19th century fortunes that put them in virtual control of most Western economies [...][1413]

[1412] Fuller, 75
[1413] Bradley[1]

By the end of the Age of Discovery, the Americas and Australia had become well-colonized, islands of the oceans were claimed, and India and Africa would be put under British Control. The Portuguese, Spanish, French, and others would have an influence elsewhere, as with Portuguese Brazil, Spanish Mexico, and French Canada.

The Reformation

The *Reformation*, an outgrowth of the pressures from the primitive and radical Christians of the proto-Reformation and insights from the Renaissance, was a period of rising Protestantism, which opposed Catholicism or Catholic corruption. This was met by the Counter-Reformation of the Catholic Church. I include Catholic heresies such as Jansenism and modernizing efforts within the Church, nonetheless, as efforts at reform, starting with Nicholas of Cusa and culminating in Catholic modernism as found in the Catholic social teaching of Pope Leo XIII. The Reformation is usually said to have begun with Martin Luther's publication of the *Ninety-five Theses*. But Daniels and Hyslop suggest that "Luther was not the first to raise his voice."[1414]

The *Radical Reformation*, direct heir of the proto-Reformation, had been a response to corruption in both the Catholic Church and then, later, the mainline or *Moderate Reformation*, its more watered-down version. Many among the Radical Reformation opposed feudalism, taxation, ecclesiastical control, tithes, and supported instead a "community of goods" or a "just price" and democratic reform. The invention of the Gutenberg printing press had allowed for literature to be spread much more widely than it had been before. Rudolf Rocker says that

> Medieval man had not yet known the state in the real sense of the word. The concept of a central power which forces every vital activity into definite forms and guides men from the cradle to the grave upon the leading strings of a higher authority was strange to him. His ideas of right were based on custom transmitted to him by tradition. His religious feeling recognised the incompleteness of all human systems and made him inclined to follow his own counsel, and to help himself and to shape his relations with his fellowmen in conformity with the ancient customs of mutual agreement. When the rising state began to undermine these rights and raised its cause to the cause of God, he fought against the injustice which was being done to him. This is the real meaning of the great popular movements of the age of the Reformation[1415]

Proto-Protestantism or Radical Protestantism had been growing for a long time, during the proto-Reformation, or Radical Reformation, with influences such as Carpocrates, Peter of Bruys, Arnold of Brescia, John Wycliffe, Girolamo Savonarola, Nicholas of Cusa, Jan Hus, Peter Waldo, and many others. "Scholar John Wycliffe criticized the church's wealth and its hierarchy of clergy," say Daniels and Hyslop. "Jan Hus led a movement aimed at reforming corrupt church leadership," but "after promising Hus protection in order to hear his views," the Church "had him burned at the stake."[1416] The pantheist millenarians and Gnostics, and the proto-Protestants, including the Bogomils, Waldensians, Lollards, Free Spirit, Stedinger, Hussites, and etc. had led the proto-Reformation. They would now be joined by other radical reformers, including the Anabaptists, those involved in the German Peasants'

[1414] Daniels and Hyslop, 192
[1415] Rocker[1]
[1416] Daniels and Hyslop, 192

War,[1417] the free thinker Sebastian Frank, and the early unitarians, to name a few. According to Rocker, the Millenarian

> traditions remained alive among the Bogomili in Bulgaria and Servia, and among the Cathari of the Latin countries. They kindled the courage of their faith among the Waldenses and the heretical sects of Languedoc and among the Humiliati and the Apostolic Brethren in Northern Italy, with their inner light. We find them among the Beguines and Beghardes in Flanders, among the Anabaptists of Holland and of Switzerland and the Lollards in England. They lived in the revolutionary popular movements in Bohemia and in the confederacies of the German peasants, who united in the Bundschuh and the Poor Conrad to break the yoke of serfdom. It was the spirit of these traditions which descended upon the Enthusiasts of Zwickau and gave to the revolutionary action of Thomas Munzer so powerful an impulse.
>
> Against some of these movements the church with the help of the temporal powers organised regular crusades, as against the Bogomili and Albigenses, whereby whole countries were for decades filled with murder and rapine and thousands were slaughtered. But these bloody persecutions only contributed to the spread of those movements. Thousands of fugitives roamed through other lands and carried their doctrines to new groups. That between most of the heretical sects of the Middle Ages international relations existed has been fully proved by historical research. Such relationships can be shown between the Bogomili and certain sects in Russia and Northern Italy, between the Waldenses and similar sects in Germany and Bohemia, between the Baptists in Holland, England, Germany and Switzerland.
>
> All the peasant revolts in Northern Italy, Flanders, France, England, Germany, Bohemia, from the thirteenth to the sixteenth century, were inspired by these movements, and give us today a fairly clear picture of the feeling and thinking of large sections of the people of that period. While we cannot speak of a unified movement, we notice a whole series of movements which preceded the great Reformation, and produced it.[1418]

Anabaptism, a common heresy among the lower classes, tended to draw from proto-Protestant elements, such as from the Waldensians, and were perhaps the main driver— coming from out of the proto-Reformation— behind the Radical Reformation. While long-anticipated, Anabaptism is often said to have formally began with groups that were informed by Huldrych Zwingli and the Swiss Reformed Church, but who departed from him over the issue of baptism as part of the Radical Reformation. It grew in number especially in the Rhinelands. Zwingli had held *The Bible* to be a higher authority than ecumenical councils and church patriarchs. Because of this, and despite his belief that aristocratic government was preferable to both monarchy and democracy, he believed that civil disobedience was befitting of a Christian if the government went against the will of God. *Anabaptism* means "baptized again," and generally referred to those who opposed infant baptism, preferring instead a *believer's baptism*, the baptism of someone after their voluntary acceptance of Christ. Perhaps the defining feature of Anabaptism, however, is not so much the act of opposing infant baptism and the support of voluntary baptism, but the dedication to the idea that God's commands are the most fundamental of all, and that no human authority should, or really even can, negate these laws. For the Anabaptists, some of them committed to a personal mysticism, and others developing toward naturalism, these laws might include the laws of Nature and the laws of morality and conscience. It is for this reason that Conrad Grebel and other broke with Zwingli for his willingness to put the authority of men over that of God. Zwingli was inconsistent in his preaching, and the Anabaptists separated themselves from Zwingli after

[1417] Later Anabaptists were usually not as violent, and included groups like the Mennonites, Amish, and Hutterites
[1418] Rocker[1]

he had suggested to wait to change the mass until the city council had made a decision. The early Anabaptists believed that *The Bible* had already dealt with the matter, and so the decision was already finalized, with no need for human approval. The Swiss Brethren would soon follow in the split, joining the Anabaptists. Hutterites, Amish, Mennonites, and more would eventually distinguish themselves later on, with more to follow.

A range of beliefs might be found among the early Anabaptists, including opposition to infant baptism and the practice of rebaptism, and favoring the laws of God over those of humans, as well as those mentioned of pantheism, unitarianism, universalism, and millenarianism, but also more. Hans Dreck, for instance, held that the "inner word of God" was superior to scripture as a source for spiritual wisdom, as *The Bible* was merely an account written by different men of a single truth. Church practices, he suggested, were humanistic and largely symbolic. Pilgram Marpeck warned against legalism, such as overemphasis on church doctrines, whimsical interpretations, and regulations of behavior, instead favoring devotion toward Christ wherein freedom could be found, and a common sense interpretation of scripture. Like Denck, Leonard Schiemer focused on the inner word of God, received directly by the "hearer" without mediation, as opposed to external rules and regulations, which may be necessary, but were not as fundamental. Some of the Anabaptists were even non-Christians, but most of them were certainly *Christian primitivists*, believing that the Church had turned from the original message of Christianity and had fallen. Some of them were mystics. They were often millenarians, sometimes universalists, and generally *church pacifists*, opposing warring in the name of Christianity by the Church, holding that no wars are just. They were in favor of separating from the wider world and generally keeping to themselves. They opposed the clergy, and generally did not maintain clergy within their own fellowships, preferring to be *lay led*, or led by the normal members of their fellowships. They practiced simple living and often Christian communism. They often opposed taking oaths or agreeing to rules, and instead practiced shunning as regulation, though they also oppose tradition. And they were prone to revolts against established authorities, opposing the ecclesiastical control of the clergy and the feudal dominance of the nobility.

The *German Peasant's War*—a country-wide revolt— had followed after the *Knights' Revolt*, in which the lesser nobles and gentry revolted against the new money order that was being established. Thomas Muntzer, a radical theologian and opponent of feudalism in Saxony, as well as both Catholicism and Lutheranism, had helped to inspire the German Peasants' War, and Bernhard Rothmann, Jan Matthys, and Jan Bockelson, would trigger the Munster Rebellion, as part of the Radical Reformation. John of Leiden had famously turned Munster into a theocracy, with himself, a peasant, as king. This had left a very militant movement behind called the Batenburgers, who were communal amongst themselves, but held few scruples in regard to the treatment of outsiders. Other important Anabaptist rebellions occurred, such as the *Gaismair Uprising*. The seat of power had been shifted by the German Peasants' Revolt.

Unitarianism is an anti-trinitarian view that stresses the unity and singularity of God. *Strict unitarianism* denies the Holy Spirit and worship of the man Jesus. Unitarianism stresses that, though Jesus was not God, he was nonetheless a great man and prophet, perhaps even supernatural. Unitarianism came from Photinus, Arius, Origen, Monarchianism, *Sabellianism* (*adoptionists* or *monarchists*), Gnosticism, and other older views, and was prominent among Germanic peoples such as the Ostrogoths, Visigoths, Vandals, and Lombards. It was largely destroyed by the Council of Nicea, whereby Trinitarianism had become the norm. However, unitarian sentiments would remain among groups such as the Polish Brethren, Moravian Brethren, Unity of the Brethren, and the Socinianism coming from out of thinkers such as Fausto Socinus and Michael Servetus, contributing to Anabaptism

as well as to the Moravian Church.[1419] Servetus, a humanist, was asked by Inquisition why he likes Jews and Turks. Michael Servetus would famously be burned at the stake for his faith. Sebastian Castellio, who opposed the death of Servetus, was carrying on the humanistic endeavor to reconcile the differences between Anabaptism, Evangelism, and Catholicism. He was an advocate of freedom of conscience, freedom of speech, etc. Unitarians often adopted Anabaptist and Universalist positions.

The Lutherans and Calvinists would lead the mainline of the Moderate Reformation. Protestantism would become dominated by the Moderate Reformation names of Martin Luther and John Calvin, and their associated Lutheranism and Calvinism. The Church of England, or Anglican Church, was also significant, as would become Presbyterianism as time went on. Lutheranism, Calvinism, and Anglicanism helped to usher in capitalistic economies, by accepting or softening the ban on usury.

Catholic modernism refers to *modernizing* elements within the Catholic Church; that is, to Renaissance, Reformation, and Enlightenment influences on Catholicism, often involving an adjustment to more recent conceptions of science and theology. Perhaps kicked off by the Renaissance man and pantheist, Nicholas of Cusa, it contained radical elements at times, and can be considered part of the greater Reformation.

The *Church of England* or *Anglican Church* is a church that is associated with *Anglicanism* or *Episcopalianism*, native Celtic-oriented Christianity, which is said by Tertullian to have existed where Rome had not conquered, and where after their withdrawal it maintained a distinct form from the rest of Christendom. It is based on theological and Church history involving Joseph of Arimathea, the secret disciple who had taken Jesus down from the cross, mummifying him and placing him in the tomb; the martyr Saint Alban, beheaded for his faith; Augustine of Cantebury, who persuaded the Anglo-Saxons; and finally by King Henry VIII, who finally separated himself from the Catholic suzerainty (a major step toward British Empire building later on) by declaring a separate church.

Lutheranism was kicked off by Martin Luther, the reformer who is often said to have launched the Protestant Reformation when he posted his *Ninety-five Theses*. He was excommunicated for his Protestantism. *Calvinism* is understood to have come about by way of John Calvin, to whom the *Reformed* movement is attributed. The Calvinist tradition makes heavy use of the theology of Augustine of Hippo, maintains a doctrine of predestination and unique views about salvation that would contribute to what Max Weber would call "the Protestant ethic" that contributed to the productive culture behind capitalism. Michael Servetus, a forerunner of Unitarianism, came to be seen as a *libertine*, or *Patriot*,— a group that had given Calvin much anguish— and so a problem to John Calvin, contributing to Servetus's being burned at the stake. Having secured his role as a heresy-hunter, and after struggles with more libertines, Calvin became a major reformer. *Presbyterianism* is a major Calvinist movement, as well as being part of Celtic Christianity, tracing its origins back to Saint Columba and through the Culdees and to the Reformation.[1420]

The Moderate Reformation had opposed *Pelagianism*, the heresy of Pelagius, who said that original sin did not apply to humans by nature, that humans can become perfected through divine grace, that Christians should live sinless lives, and that infants did not demand baptism because they were not sinners.

While Protestants, Radical and Moderate, were infighting, thinkers such as Agostino Steuco, the humanist and perennial philosopher, opposed the Reformation, instead countering with a traditionalist

[1419] The Moravian Brethren came from the Hussites and the Unity of the Brethren
[1420] Presbyterians would come to be considered Nonconformists

Counter-Reformation, an effort of Catholic resurgence. He was the first to write a book-length work on the perennial philosophy. Many others, including the Church at large, would join him in his Counter-Reformation efforts.

Conflicts involving Protestant Reformation and Catholic Counter-Reformation interests, called the *European Wars of Religion*, occurred throughout this period, such as with the Eighty Years' War—or war of Dutch independence— and then the Thirty Years' War involving Spain and France. The emergence of pike use, such as among the Swiss, Scots, Dutch, and Flemish, against men-at-arms—mounted warriors in armor, or "knights"— was an important innovation that served to empower infantrymen against onsoughts from horseback. War between the Protestant factions and with Catholics resulted in the establishment of nations and of international law, seen as necessary to regulate the conflicts. International law can be traced through the canon law of Catholicism and "just war" doctrine, the commercial Hanseatic League's Laws of Wisby, and the Law Merchant, for example, all of which were systems of law operating across the boundaries of countries. But the "law of nations" would not really take hold until after the Eighty Years' War, the Thirty Years' War, the War of the Mantuan Succession, and the Franco-Spanish and Portuguese Restoration Wars.

The Thirty Years' War culminated in the Treaty of Westphalia, from which the modern notion of the nation-state developed.[1421] Hugo Grotius had been a legal scholar who greatly influenced the Law of Nations and the Treaty at Westphalia. The *Treaty of Westphalia*, based largely upon the thinking of Grotius, had been an agreement to recognize national boundaries, and had resulted in the nation-state system and the law of nations. This treaty would essentially begin the nation-state system that allowed for an increase in the freedom of religion between states. Recognizing the importance of the Treaty, Daniels and Hyslop suggest that it was "an important step toward religious toleration" that "brought peace; Catholics and Protestants recognized the right of others to exist in their own states."[1422] Each party had from then on been allowed to determine the religion practiced within its own boundaries, between Catholicism, Lutheranism, and Calvinism. This had resulted in increasing national self-determination in other areas as well. The Treaty at Westphalia had also resulted in what is called, by William S. Lind, the "*first generation*" of modern warfare. *First Generation Warfare* refers to modern warfare as it was carried out by way of muskets and bayonets, wherein armies would advance slowly in line and column formations, essentially taking turns shooting one another in neatly-formed rows.

Grotius understood international law in natural and positive law terms, and as a matter of mutual aid, and understood the "society of states" to have a mutual interest in securing international law as *positive law*—law established by fact—, which he developed from out of natural law principles. He also maintained an interest in maritime law, in contrast to the law of the land. Having witnessed the bloodshed and incivility of wars, and anticipating humanitarian elitism, he was determined to establish positive law between nations. His thinking would become influential among heretical pantheist thinkers like Baruch Spinoza, and radical Mutualist thinkers such as Pierre Proudhon. Grotius says,

> the very nature of man, which even if he had no lack of anything would lead us into the mutual relations of society, is the mother of the law of nature. But the mother of municipal law is that obligation which arises from mutual consent; and since this obligation derives its force from the law of nature, nature may be considered, so to say, the great-grandmother of municipal law.

[1421] This had followed after various other attempts by governments to establish agreements, such as the Peace of Passau, Peace of Augsburg, Peace of Prague, etc., in order to settle issues relating to the conflicts between Catholics and Protestants, traditional modes of succession, and etc.
[1422] Daniels and Hyslop, 137

> The law of nature nonetheless has the reinforcement of expediency; for the author of nature willed that as individuals we should be weak, and should lack many things needed in order to live properly, to the end that we might be more constrained to cultivate the social life. But expediency afforded an opportunity also for municipal law, since that kind of association of which we have spoken [the state], and subjection to authority, have their roots in expediency. From this it follows that those who prescribe laws for others in so doing are accustomed to have or ought to have some advantage in view.
>
> [...]
>
> But just as the laws of each state have in view the advantage of that state, so by mutual consent it has become possible that certain laws should originate as between all states, or a great many states; and it is apparent that the laws thus originating had in view the advantage, not of particular states, but of the great society of states. And this is what is called the law of nations, whenever we distinguish that term from the law of nature.[1423]

Thomas Hobbes had also come to the conclusion that a universal social contract would be desirable, in his book *Leviathan*, as had Kant in his *Perpetual Peace: A Philosophical Sketch*. Much of this sort of thinking had been due to the misery caused by the economic depression known as the *General Crisis* that had come out of China and had accompanied the Little Ice Age and the English Civil War, the Fronde in France, the end of the Thirty Years' War, and Spanish and Portuguese revolts. In some respects, this was not unlike the Crisis of the Late Middle Ages— which had seen also upheavals and civil wars— the Medieval Warm Period, the Great Famine, and Black Death. The Reformation and the Scientific Revolution had created an overall crisis in relations between the people and the state, and the Westphalian nation-state system had been the resolution.

Grotius's efforts may represent a long-established maritime goal, or at least are easily fit into that narrative. Many of the Native Americans had legends of a relative, *Pahana*, or "Lost White Brother," who would one day return. According to Manly P. Hall, in his *The Secret Destiny of America,* democracy and idealism had been a project of the ancients carried on since Akhenaten and throughout the ages in philosophy, that the Knights Templar had visited the peoples of South America leading the indigenous there to think of the Spanish *conquistadors* as a return of the gods, and that Christopher Columbus, Francis Bacon, and Benjamin Franklin had been advised— by an ancient secret society aiming to restore world civilization as it once had been, called the *Order of the Quest* or *Society of Unknown Philosophers*, also called the *Great White Brotherhood*[1424]—to get the ball rolling on establishing America as a utopian, idealist, democracy, a project destined for the world. Coming from the Martinist tradition, it may be that Manly P. Hall is taking part in the "imagined histories" that David Allen Harvey discusses in *Beyond Enlightenment: Occultism and Politics in Modern France*. But whatever the case may be, it is clear that a long-established interest in internationalism, developing from maritime perspectives, is available for humanitarian elites and contemporary globalists to associate with as a tradition or shared vision.

Natural Magic and the Scientific Revolution

The great questioning of the Reformation, and the alchemy, engineering, and potions of the Renaissance, would usher in the Scientific Revolution. The *Scientific Revolution*, which largely coincided with the latter parts of the Reformation and Renaissance humanism, was about placing a

[1423] Grotius, 13

[1424] Most recently re-established by Max Theon, inspirant of synarchist religion

greater focus on philosophical naturalism and applied sciences such as mechanics and politics. Margaret C. Jacob says, "[t]he conceptual roots of the Scientific Revolution lie in Renaissance Neo-Platonism and it is in that tradition that we find the bridge between the new science and pantheism."[1425] Once again, as with most things, pantheism can be found at the point-of-origin for the Scientific Revolution.

The common pantheist position might be described as a form of *neutral monism*, a monism—or claim that everything can be reduced to One— which is not purely materially-reductionist, but reduces both spirit and body, mind and matter—or any other dichotomy, trichotomy, or pluralism— to a more fundamental and non-differentiable Substance. For the pantheist, this Substance, a Ground of Being or perhaps a Chain of Being—beyond the polarities of mortality—, is God. Of course, the pantheists are not unanimous in their delivery of this message, each coming from their own peculiar background of influences from outside the tradition of pantheism, which they feel the need to reconcile with their beliefs. But, for the most part, and even if a difference of language is chosen, the pantheists stay true to the spirit of neutral monism.[1426]

As well as neutral monists, the pantheist thinkers might also be considered to be *organicists*. The organicists' ideas are the closest to the magical worldview wherein matter is imbued with life (perhaps by an *animus mundi* or "World Soul"), itself a hylozoic or hylopsychic carryover from animism. *Organicism* maintains the original conjointedness of efficient and final causation found in magic (and in Nature as understood by Aristotle), but does away with some of the mysticism, filling in for the "god of the gaps" as Henry Drummond, who coined the term, said, expressing an organic view, that "an immanent God, which is the God of Evolution, is infinitely grander than the occasional wonder-worker, who is the God of old theology."[1427]

The mathematician Joseph Raphson is said, by Gary Suttle, in "Joseph Raphson," to have coined the term *pantheism*, distinguishing it from the physicalist materialism of the atheists— who believe that the physical reality of matter is all that is— by the belief that there is also intelligence by which totality fashions itself.[1428] This view is consistent with organic and neutral monist thinkers such as David of Dinant and Giordano Bruno. The natural philosopher Bernardino Telesio had a similar view in some respects, holding that existence has matter that is acted on by two forces, those of a contracting cold and an expanding hot (Archelaus had long before attributed motion to a separation of hot and cold). Taking to animism or hylozoism, he held that there is life in all of matter, that matter is self-constructing, that it is conscious because consciousness exists and could not have come from nothing, and that each thing develops best according to its own nature, whereby its motion benefited everything else.

Among the mainline thinkers of the Scientific Revolution, perhaps better understood as a Counter-Revolution, empiricism and the inductive methods of logic were put up front. Inductive reasoning had become the focus over deduction for many, leading to the modern "scientific method." Thinkers such as Francis Bacon, Thomas Hobbes, George Berkeley, and David Hume had pushed empiricism, and Bacon

---

[1425] Jacob, 5

[1426] Even the *physikoi* and *physiologoi*, and the *mythologoi* and *theologoi*—representing idealistic monism and physicalist monism— were generally impure in their differences; Heraclitus spoke of change as the only thing that is permanent, allowing a paradox of permanence to exist even where it is denounced, and Parmenides made clear that the world of *doxa*— of change— was nonetheless worth familiarizing oneself with. Physicalist and idealist interpretations of monism are not completely foreign to those who revere the Whole, but nonetheless are not the staples of pantheism that neutral monism would become, characterizing the philosophies of thinkers such as David of Dinant, Giordano Bruno, Baruch Spinoza, etc.

[1427] Drummond, 333

[1428] Suttle

in particular is considered to have been a main influence on the mainline of the Scientific Revolution. Along with Bacon, Copernicus, and Galileo, Kepler and Newton are leading names of this time. Newton had stolen the limelight from the polymath Robert Hooke, a microscopist and telescopist who discovered cells, wrote on Earthquakes, and observed Jupiter and Saturn. His name and portrait were possibly suppressed so as not to allow a rival to Newton. It was the deistic scientism of the mainstream Baconian and Newtonian that would be adopted and spread amongst the *bourgeoisie*, merchants, and gentry, and that would be favored in education even to this day. Baconian "new science" would eventually be institutionalized by the ruling classes, and organicism dismissed in the halls of academia.[1429]

Antonella Vannini, in her "Entropy and Syntropy: From Mechanical to Life Science," recognizes a divide between the organismic worldview of Aristotlean vitalism (which would be favored among pantheists and inspire Spinoza's "*conatus*") and the mechanistic worldview of what Jacob might refer to as that of the "Newtonians" or "deists," Bacon and Descartes included. Vannini says, in "Entropy and Syntropy: From Mechanical to Life Science," that

> Whereas previously the purpose of science had been to understand nature and life, science's purpose now [under the mechanical philosophy] involved the controlling and manipulating of nature. As Bacon said: "Objective knowledge will give command over nature, medicine, mechanical forces, and all other aspects of the universe". In this perspective, the aim of science becomes that of enslaving nature, of using torture to extract its secrets. We are now far away from the concept of "Mother Earth", and this concept will be totally lost when the organic concept of nature will be replaced by the mechanical concept of the world, which can be traced back to the works of Newton and Descartes.[1430]

Pantheists, unlike the atheists and mechanistic deists, were often inclined to a more organic worldview, like that described by Vannini.[1431] But atheists, deists, and Protestants drew ever-nearer to mechanism.

While the pantheists held Nature in high esteem, Bacon saw to it that she was raped. Clifford D. Conner tells us that Bacon "portrayed Nature as a female who was hiding her secrets." Bacon "cited the way women suspected of witchcraft were tortured by mechanical devices to extract confessions as a metaphor to indicate the methods of inquisition by which Nature's secrets should be extracted from her." Conner says that they used "sexual imagery of penetrating, torturing, and enslaving Mother Nature."[1432] Afterall, it was the witches, largely as nurses and midwives, who were posing a challenge to the patriarchal order of the day. As Barbara Ehrenreich and Deirdre English write, in "Witches, Midwives, and Nurses," "it was the women healers who represented a more humane, empirical approach to healing,"[1433] whereas "monopolization of medicine meant control over its institutional organizations, its theory and practice, its profits and prestige." Thus, "suppression of female healers by the medical establishment was a political struggle," and a "class struggle." "Witches," afterall, had "lived

---

[1429] The conflicts between the organicists and mechanists would come back to the fore during the later debates on evolution, between the Malthusians and the Mutualists

[1430] Vannini[2]

[1431] Nonetheless, pantheism and these other views also interacted, and the organicists proved themselves to be more responsive to the findings of the mechanists than the other way around. Afterall, pantheism and deism are not at necessary odds, as *pandeism* is also a workable philosophy, combining elements from both, holding that God became the material universe, ceasing to intervene in its operations and letting predetermined laws or forces play themselves out. The emanationist philosophy is pandeistic to a degree, at least so far as one is descending from the Source but nonetheless contained in the One. Ascent would imply a teleology that disqualifies emantionism from pure pandeism, however.

[1432] Conner[1], 364

[1433] Ehrenreich and English, 2

and were burned long before the development of modern medical technology," and the "great majority of them were lay healers serving the peasant population."[1434]

Margaret Murray, in *The God of the Witches*, points to a secret god of the witches, worshipped across Europe, one form of which was the horned god, *Pan*, from which *pantheism* is derived. Francois Rabelais writes, in the fourth book of *The Life of Gargantua and of Pantagruel*, that the announcement of the death of Pan, which had occurred around the same time as the death of Christ, had actually been about Christ, saying "for he may lawfully be said in the Greek tongue to be Pan, since he is our all. For all that we are, all that we live, all that we have, all that we hope, is him, by him, from him, and in him."[1435]

Witches included women folk healers engaged in white and green magic or acting as sorcerers of black magic, although the Walensians had also been accused of holding the Witches' Sabbath as well, perhaps because they were, like Jews and other Sabbatareans, seventh-day Sabbath-keepers who worshipped on Saturday.[1436] Some of the Beguines had been considered witches, many of them being folk healers, well-versed in botanicals, practicing *green* or *natural magic*,[1437] magic that functions according to natural principles, what we might today call *applied science*, rather than appeals to supernaturalism. They had been so sought after that even the gentry and nobility would pay for their services at times. They also acted as nurses and midwives. Jacqueline Felicie had been a self-taught physician, keen on keeping "women's secrets," who was well-known as a successful healer who would not charge unless a cure had been demonstrated. A green witch, she came up against the trained physicians, who opposed her untrained use of the same kinds of procedures. She was fined and banned from practicing medicine, on the grounds of being a woman and being untrained. Paula de Eguiliz, likewise, was a famous folkhealer and practitioner of green magic, an African slave woman, who was burned at the stake. Witches were well-known for their *grimoires*, or spell-books. *Grimoire* comes from *grammar* and literally refers to skillfulness in learning and especially in the art of letters, language, and philology.[1438]

Black magic would also be practiced by some witches,[1439] and was not intent on healing, the way white and green magic was. Eventually, *grimoire* would come to be associated with grim things such as the summoning of demons for black magic. Perhaps the most famous of the black witches is Catherine La Voison, famous for her organizing of Black Masses and her role in the *poison affair*, in which over a thousand people likely died from being poisoned. Her Black Masses would come to include the Madame de Montespan, the chief mistress to King Louis XIV. In such a Black Mass, Madame de Montespan is said to have laid upon an alter naked, being worshipped while black candles were burning and a chalice was placed upon her body, wherein it is expected that blood, drained from the sacrifice of an infant purchased from a prostitute, would be caught, with a prayer said to Satan. She may have been tortured, but likely was not, before she was publicly set ablaze at the stake. Giula Tofana was another practitioner of the black arts, selling poison to women wishing to be widowed, being tortured and executed for it. Marie-Anne de La Ville, likewise, was implicated for poisoning, and was compared to La Voison. Priests such as Pere Robert and Guibourg helped with the Black Masses of witches. La Voison's story is not entirely unlike that of Elizabeth Bathory, who is said to have been responsible for the torture and deaths of hundreds of women and little girls of the gentry, and also to have bathed in their blood.

[1434] Ehrenreich and English, 3
[1435] Rabelais
[1436] "Saturn's day," or perhaps "Satan's day"
[1437] Francesco Cattani da Diacceto originally delineated natural from supernatural magic
[1438] In Old English, grammar was called *stæfcræft* and in Scottish developed into *glamour*
[1439] Alternatively, some suggest that *witch* only applies to practitioners of black magic

Joan of Arc, the famed military leader coming from the peasantry and from the textiles field, who had claimed to have been inspired by divine forces, had been burned as a witch. It was said that "the Devil sucked from the witch's teet," a connection to her maternal black magic powers. Sometimes moles, birthmarks, extra nipples, or skin tags, at one time enabling one to become a shaman, were considered to be marks of being a witch. Despite the commonality of such practices, Margaret Murray believed that what the hunters were really looking for, however, to be tattoos that witches would use to identify themselves with part of the movement that was keeping paganism and witchcraft alive in Europe. She claims also that Joan of Arc and Gilles de Rais, her companion-in-arms, who is said to have confessed to having had raped and murdered young boys (a claim Murray rejects), were a part of this cult, though this is doubted by such strong minds as Norman Cohn. Fear of witches, stoked by religion primarily, had become hysteria, and a moral panic led to witch hunts becoming common practice, leading to events such as the Pendle and the Salem Witch Trials. Barbara Ehrenreich and Deirdre English suggest, "the witch-craze was neither a lynching party nor a mass suicide by hysterical women. Rather, it followed well-ordered, legalistic procedures. The witch-hunts were well-organized campaigns, initiated, financed, and executed by Church and State."[1440] Nonetheless, "[w]itch hunts did not eliminate the lower class woman healer, but they branded her forever as superstitious and possibly malevolent."[1441]

While Bacon had been the natural philosopher of the *bourgeois*, the popular natural philosopher among the lower classes—especially miners— was the rational mystic, or natural magician, Paracelsus. Paracelsus, the Hermetic alchemist, physician, and astrologer, had been an important influence during the Scientific Revolution, but especially so among radicals. Paracelsus is known as the "father of toxicology" and was one of the pioneers of the Renaissance medical revolution. His motto was said to be: "Let no man belong to another who can belong to himself." His ideas were widely supported by those among the Renaissance and the Radical Reformation. Clifford D. Conner writes that

> Bacon's general antipathy toward independent knowledge-seeking is perhaps most clearly revealed in his attitude toward the movement inaugurated by Paracelsus, which instigated revolutionary change in the chemical and medical sciences. Paracelsian influence rivaled Bacon's for the allegiance of intellectuals and the nonclerical, commercial elite. Although Baconianism eventually emerged as the main ideological current of the Scientific Revolution, the Paracelsian challenge—in many ways a "people's science" movement—represented a major countercurrent.[1442]

Like the pantheists, the Paracelsian worldview was more organic than strictly physicalist. Thinkers such as Paracelsus and the pantheists had represented a popular vitalistic, organismic worldview that was much different from that of their *bourgeois*, deist counterparts. This worldview was behind the Radical Reformation and later the Radical Enlightenment.

The *Art of Memory*, techniques used to memorize information better and in greater quantity, shifted in the Scientific Revolution away from the use of mnemonic devices, amulets, the "method of *loci*" or "mind palaces," and etc. and toward books and complex arrangements of causes and effects, or algorithmic thinking. This was, perhaps, initiated by Ramon Llull, but Petrus Ramus—whom Frances Yates put in the Llullist tradition—, would become especially influential on the Art of Memory. Petrus Ramus would help to shift the Art of Memory, such as that used by Llull and many others, toward methodology over mnemonics. This emphasis on methodology and logical flow would carry on into the Enlightenment, which would displace the Art of Memory. With an emphasis on causality, and with a comprehensive grasp of outcomes, memories became more relevant to one another, rather than being a

[1440] Ehrenreich and English, 7
[1441] Ehrenreich and English, 17
[1442] Conner[1], 301

loose collection of unrelated facts. Deduction, as a result, became more widespread, paving the way for rationalism. Ramus had produced an alternative logic to Aristotle, and, suggests Frances Yates, worked in the opposite direction to the occult by reducing the role of images for use in memory. He was a follower of the dialectician Rudolphus Agricola, and liked to use binary trees (leading up to Cartesian dualism). He was generally opposed by Jesuits and Aristotlean scholastics.

Perhaps the most celebrated of astrological herbalogists, outside of Paracelsus, was Nicholas Culpeper, whose works included *The English Physician*, later called the *Complete Herbal*, and *Astrological Judgement of Diseases from the Decumbiture of the Sick*. His herbal is still partially in use today, and he was known for being able to solve ailments by comparing the astrological birth chart of his patients with their exposure to certain elements, which he believed correlated to ailments in particular organs as well as to the stars, adhering like Paracelsus to the Doctrine of Signatures. Like many of the natural magicians, Culpeper was a radical republican, influenced by the Puritan preacher John Goodwin as such, and he saw his enterprise as providing useful knowledge to the poor, knowledge he intended to make widespread, publishing his works in vernacular and selling them for low prices. He would often provide his services free of charge to the poor, believing no one should starve in order to pay a physician, many of whom Culpeper believed to be ignorant for practicing bloodletting. He believed that priests had diseased the people's souls, physicians their bodies, and lawyers their estates. He would eventually be accused of witchcraft.

Ephraim Chambers's *Cyclopedia, or Universal Dictionary of Arts and Sciences*, which was an attempt to extend dictionaries to practical ends, not merely defining but demonstrating the ideas defined, kicked off the trend of *Encyclopedism*, the social effort to compile of vast arrays of knowledge. Chambers had been anticipated in this effort by medievals such as Vincent of Beauvais and his *The Great Mirror* and by John Harris's *Lexicon Technicum: A Universal English Dictionary of Arts and Sciences: Explaining not only the Terms of Art, but the Arts Themselves*. Encyclopedism would be continued forward and culminate in the efforts of radicals such as Denis Diderot, whose own efforts began as an expansion to Chambers's work.

Pantheistic thinkers such as Plotinus, Eriugena, the Amalricians, and on to Llull, Paracelsus, Ramus, Culpeper, and Giordano Bruno can be categorized not only as natural philosophers, but also as rational mystics or green magicians, in that they did not believe in the supernatural, so much as hold that Nature was itself super, containing much Wonder and Mystery, Rhyme and Reason, with forms of Goodness, Truth, and Beauty. Their view is *preternatural*— dealing with "marvels and mysteries," "anomalies within nature"[1443] suggests Bruce Lerro in *Forging Promethean Psychology*, and that are suspended between the mundane and the miraculous—, rather than supernatural. While magical views can certainly be found in neo-Platonism, and in the thought and practices of Bruno and Paracelsus, such magic was understood to take place within a Monad, the One, or the All, and not outside of Nature conceived of as the totality of existence. *Magic* properly understood simply referred to the agency that one has as a part of Nature to change the world from within it. If grounded, magic is not necessarily disconnected from natural philosophy. In fact, magical arts such as alchemy and astrology developed toward sciences such as chemistry and astronomy. In a way, the rational mysticism of thinkers like those named above was something of a reconciliation between Homeric mythologies, theologies from Socrates to St. Augustine, Aristotlean or Thomist vitalism, the neo-Platonic and Gnostic magical thought (that still persisted in thinkers like Bruno) of the Renaissance, Graeco-Roman and modern physicalism and skepticism, to sample just a few. It involved mythology and theology as well as natural philosophy. Jean Jacquot suggests that a group of expirimenters surrounding Sir Walter Raleigh and

[1443] See Lerro, 188

the "Wizard Earl" Henry Percy stand as an example of natural magic like that of Bruno's transitioning into natural science. Other natural magicians include Marsilio Ficino, Johannes Trithemius, and Heinrich Agrippa. But the man who wrote the book on natural magic, quite literally, *Magia Naturalis*, was Giambattista della Porta. This work covered such sciences as cooking, optics, medicines and poisons, steelmaking, geology, magnetism, gunpower, invisible writing, cosmetics, and perfume. He was careful to distinguish his effort from black magic and spiritualism, saying that his type of magic is "natural; which all excellent wise men do admit and embrace, and worship with great applause," saying "neither is there anything more esteemed, or better thought of, by men of learning" than green magic. Giambattista wrote that

> if ever a man labored earnestly to discover the secrets of Nature, it was I; For with all my mind and power, I have turned over the monuments of our ancestors, and if they wrote anything that was secret and concealed, that I enrolled in my catalogue of rarities.

In reaction to such efforts, Bruce Lerro tells us that the magical arts had been split between modern mechanistic science and Protestant religion (the modern *physikoi* and *theologoi*), with efficient causation, or determinism and fate, going to the scientific side and final causation, or teleology and destiny, going to the religious. He says that

> Science and religion divided up the spoils following a coordinated attack on magic. Science claimed the world of matter, while religion claimed the world of spirit [...] This however, had detrimental effects on each: science became soulless and mechanized, while religion became immaterial and otherworldly. The magical traditions, both high [...] and low [...] were cut out of the deal.[1444]

This established a divide between mechanistic philosophy and Protestantism (plus modernizing or reforming exoteric Catholicism). While Bruce points to High and Low magic, it was green magic, especially— the mundane—, that had previously been uniting what was sacred or ideal in religion with what was profane or material in science. But the profanity of science had started to replace the sacred among some of the humanistic atheists, who continued to look upon nature as profane but started to see humanity as sacred. Protestantism and mechanistic humanism together looked at nature as something to be controlled by a higher power, either by God or Man. In harmony with Vannini and Conner, Lerro says that

> The leaders of the Protestant Reformation shared many of the same perceptions of nature as did the mechanistic scientists [...] Both Protestants and mechanistic scientists saw nature as an unregulated wilderness in need of taming. One of the consequences of the rise of scientific mechanism was that it severed the active, co-creative, self-regulating, and unpredictable qualities of nature and delivered her chained and bound so she could be scrutinized by scientists, submissive to God, and, as we shall see, exploited by capitalists.[1445]

Vitalism in scientific worldviews remained as an element mainly within the naturalistic and sometimes panpsychic outlooks of the organicists. Protestantism and mechanistic science tried to do away with the vital, internal impulses of life, looking instead to external sources for explanations.

The relationship of Protestantism and modernized Catholicism one the one hand, and mechanical science on the other, to organicism—*organicism* having grown from magic while the others diverged

[1444] Lerro, 247
[1445] Lerro, 227

from it—, may reflect the relationship of natural magic with witchcraft or "*Low magic*" and ceremonial or "*High magic*," as Aleister Crowley called them. As organicism itself had developed from natural magic—which maintained elements of both High and Low magic— after the reformed Christianity and mechanical science split, natural magic seems to have developed from a more original form of magic after witchcraft and ceremonial magic had split from that original form, itself probably a variety of shamanic sorcery. Quite similarly, the philosophers had split from the sophists, taking the form of the *physikoi* and *physiologoi* and the *theologoi* and *mythologoi*, with philosophers such as Xenophanes, Pyrrho, and the Stoics having taken a more "middle of the road" approach, reflecting some of the qualities of the original Sophists along the way. Plato and Aristotle, likewise, diverged in idealistic and physicalistic directions from the original theologism of Socrates, with Euclides and the Megarian school, perhaps, developing more from Socrates himself, who reflected sophism to some extent, but took from *physikoi* like Anaxagoras and *theologoi* like the proto-Platonic Diotima of Mantinea equally (though the Socratic Revolution in moral philosophy tended to be described as a win for the theologians). Organic evolution occurs through a divergence and then "unity of opposites," a feature of neutral (or dialectical) monism.

The great *Pantheism Controversy* is an example of the clash between the organicist and mechanistic worldviews, but, like the "Atheism Dispute," also related to a conflict between philosophy and religion more generally. This Pantheism Controversy arose largely as a disagreement between Friedrich Heinrich Jacobi and Moses Mendelssohn about Gotthold Lessing's views on Spinozism, but would grow into a more public affair. The Atheist Dispute involved philosopher Johann Gottlieb Fichte, son of a weaver, accused of atheism, for his assertions that God was simply the moral order of the world, an idea also enabled by Spinoza. These kinds of controversies were crucial in moving society forward toward the Age of Enlightenment.

Margaret Jacob, like Jonathan Israel, tends to lump Spinozan pantheist thought in with materialist atheists, and to describe his worldview as mechanical. While it is true that Spinoza's thought inspired many atheists, and certainly included mechanism, his worldview is much deeper than that. It is mistaken of Jacob and Israel to describe Spinoza's views as entirely mechanistic. Spinoza's view might better be described as *organic*. Spinoza is often characterized as opposing all teleology, a component common in organic worldviews, but he wields a concept he calls "*conatus*" that is much like teleology. He was, in fact, uniting some degree of teleology and efficient causation in his philosophy (and so constitutes a vitalistic-mechanist, an organicist). Indeed, Rudolf Rocker had held that "the brilliant Jewish thinker, Baruch Spinoza, [...] explained all phenomena of the process of the universe as owing to implicit necessity, and not only had a conception of the general idea of evolution, but anticipated some of its most fundamental hypotheses, such as, for example, the impulse of self-preservation."[1446] Like the atheists, Spinoza rejected religion and respected empiricism, but Spinoza himself was something more, like Descartes, of a rationalist, and, like Bruno, and mystic. He was not limited more simply to having a strictly empiricist or atheistic worldview. He was, like Bruno, and perhaps inspired by Kabbalah, interested in the alchemical relationship between spirit and body, or temporal and extended substance. This places him in the magical tradition with other neutral monists and organicists.

Religious Dissent and Freedom of Thought

Heresies from the Radical Reformation would seem to form two main poles come the time of the Scientific Revolution. It seems that when magic was broken up into Protestantism and science more generally, that this affected the radicals as much as the mainstream, and that radicals themselves

[1446] Rocker[1]

tended to one pole or another. These poles represent, more or less, *religious dissent* or *truth-seeking*, and *free thought*. Most of the radical textile workers would come from or coalesce toward either of these, representing a range of religious and irreligious beliefs, from pantheism and deism to Biblical unitarianism and atheism.

The branch representing the more religious side, of Anabaptism, Unitarianism, and radical Protestantism, developed into various religious groups that would come to be known as *Dissenters* and *Nonconformists*. A *dissenter* or *Nonconformist* refers most typically to an opponent of the Anglican Church, but can be used more widely to apply to opponents of any establishment church. Dissenters have been large in number and are often self-arranged into distinct sects according to belief and fellowship. The reasons for their dissent are diverse, but may include a difference of emphasis or translation of religious texts, a difference on rulings by church elders, opposition to ecclesiastical authority, or etc. The other branch, more inclined to natural philosophy and natural magic, developed into the more secular movement called *free thought*. Dissenters tended to be, though were not always, more rural, while free thinkers were more urban.

Nonetheless, as can be readily understood when one compares the more religious Gerrard Winstanley to the less religious John Toland, the lines are not always easily drawn or non-arbitrary, as Winstanley can be put into the free thinker camp almost as easily as the Dissenter camp, and Toland might just as well be considered a religious Dissenter as a free thinker. Winstanley refers to God at times as *Reason*, and Toland—the first labeled *free thinker*— reveres Nature as God. Both are pantheists. Still, there were many Dissenters who, while certainly critical thinkers at times, restrained themselves to religious study; and there were many free thinkers who would have nothing at all to do with religion. Here is where the poles come to light. The division between these would become especially strong come the Great Awakening, but there was resonance between the groups, particularly among pantheistic radicals such as the Diggers and Ranters, and among particularly radical Nonconformist church-goers, such as radical elements among what would become the Unitarians and Universalists, as well as the Seekers, the Quakers, Congregationalists, and other Dissenters who might take interest in more naturalistic explanations. Together, and with slightly less radical Protestant Nonconformists such as the Methodists and the Baptists, the Dissenters and free thinkers shared in the Radical Enlightenment desire to separate Church from State.

Alongside more mainstream Protestant movements, such as Anglicanism, Lutheranism, and Calvinism, and existing alongside witchcraft and some ceremonial magicians practice the Gnostic and Hermetic high arts, there were proto-Protestant remnants like the Waldensians and other Radical Reformation elements such as Anabaptism and what would be Unitarianism. Modern radicalism can be found among dissenters that grew out of Anabaptism and other primitive Christian, Protestant, and Catholic heretical movements (and, often, belligerents in civil wars and revolts).

The Anabaptists had developed largely into more modern groups such as the Hutterites, Mennonites, and Amish. These groups are typified by plain dress, an aversion to certain technologies, anticlericalism, a plain and simple reading of religious texts, and other Radical Reformation tendencies.

Hutterites are an ethnoreligious branch of Anabaptism, formed by Jacob Hutter along the lines of the Anabaptist Schleitheim Confession. They maintain a *community of goods*, or common ownership, hold to nonresistance, and are known for living in *intentional communities*, communities that have been established through intention rather than by way of social clumping or mere proximity. On at least one occasion, there is documentation of the Hutterites making use of the *Eye of Providence*, or the "all-seeing eye" often associated with illuminism and Freemasonry, as can be seen in the documentary

Children of Utopia by Klaus Stanjek, wherein a Hutterite teaching children shows them a picture of the eye within the triangle, asking "[w]hat does that eye there mean?" to which one of the children replies, "He is watching us."[1447] When asked by a documentarian whether a boy has ever lived outside of his Hutterite commune, the boy answers yes, and, when coaxed to explain what it was like, was quick to explain having seen a vast difference between rich and poor which was foreign to him in the commune.

The *Amish* had its beginning when Jakob Amman, an illiterate but financially-stable tailor, led a schism by Swiss and Alsatian Anabaptists. Amman had argued that the *good-hearted*, or those who had sympathized with Anabaptism but did not become rebaptized, could not be saved, and so should be banned and socially shunned like those who lie. Amman had been opposed by Hans Reist of the Swiss Brethren, who did not believe that the good-hearted should not be eaten with, as Amman did. This resulted in the schism, whereby the Amman and the Reist side excommunicated one another. Those who had went with Reist would become known as *Mennonites*. The Old Order Amish, in particular, are known for still living a lifestyle associated with the ways of the 19th century, avoiding automobiles and gas or diesel tractors, electricity, and most of the conveniences of the 20th century, much less the 21st. Instead, like dedicated Luddites, they make use of horse-drawn buggies and make use of draft animals also for such activities as logging, plowing their fields, and etc. They clothe themselves in "plain dress" made of textiles that may be grown or raised by the Amish themselves and that are handmade into shirts, trousers, and dresses generally by Amish women. There are Old Order non-Amish Anabaptists as well, such as the Old Order Mennonites, whose lifestyles are very similar. Among many of the Anabaptists, *Martyr's Mirror*, or *The Bloody Theater*, by Thieleman J. van Braght, outlining the persecutions of the Anabaptists, is the most-beloved book outside of *The Bible*. Persecution of the Anabaptists was continued for a very long time in Switzerland.

Within and beside semi-radical liberal and republican movements such as the French Huguenots (home church Calvinists, many of whom involved in the textile industry, influenced by the Waldensians) and the Levellers (who had some adherents within the New Model Army), were found dissenter movements such as the Seekers, Ranters, True Levellers (Diggers), Luddites, and other radical and heretical movements that had potentially taken influence from the Free Spirit heresy, many of whom had connections to the textiles industry in which the heresy had been so prominent.[1448] Radical groups like these had been responsible for much upheaval and rejection of authority, and in some respects led the way for less marginalized groups with more mainstream messages to stake their claims, both through the expansion of ideas and pushing the boundaries. The Ranters and Diggers and Luddites are often mentioned as early examples of what would become eco-socialist or green anarchist movements. Clifford Harper says that "Free Spirit anarchism reached its most developed form [...] among the Ranters and the Diggers." He says, "[t]hen, as now, anarchism found fertile soil in which to grow among the embittered, betrayed soldiers, the landless peasants and wretched slum dwellers of the towns and cities."[1449]

Among all of the sects of Dissenters it seems the Diggers were the most significant from the period to our studies of working class Mutualism, as they are consistently recognized as early socialists and proto-anarchists that tried to form utopian alternatives to their present conditions. The *Diggers* were a communalist sect led by Gerrard Winstanley, a tailor. They were called *Diggers* by others, but they had referred to themselves as the "*True Levellers*" in contrast to the generally less radical Levellers who

[1447] Stanjek, 24:22
[1448] This was certainly true of Gerrard Winstanley, the leader of the Diggers, who had been a tailor
[1449] Harper, 10

would go on to influence *bourgeois* liberalism. Winstanley had attempted to form an intentional community or rural commune on farmed wasteland. This is where the *Digger* name derives.[1450, 1451]

Like the Beguines and Beghards and other adepts of the Free Spirit, Winstanley and the Diggers derived their radicalism from pantheism. Jacob writes that for "philosophers such as Winstanley, nature is in effect God, and this pantheistic materialism proclaimed the equality of all people through nature as well as the usefulness of the popular sciences—alchemy, astrology, herbal medicine and the magical arts." She says that "pantheism could constitute the philosophical foundations for democratic belief."[1452] Margaret Jacob says that the "first occasion in early modern history when philosophies of nature and their prescriptions for the social order took on revolutionary significance" had occurred when "the revolutionary implications of pantheism were made all too clear in the preaching and political program of the radical sectaries—the Levellers and Diggers in particular—and in a very attenuated sense, they became the ancestors of the various eighteenth-century republicans."[1453] Norman Cohn says that Winstanley was inspired by "supernatural illuminations" to go about his experiment. He says that "Winstanley attempted to restore mankind to its 'Virgin-state', a primitivist Millenium in which private property, class distinctions and human authority would have no place."[1454] Winstanley himself seems, in "The Law of Freedom in a Platform," to have been very radical, taking matters to the root, the Right of Conquest, when he writes

> Is not the Land your brothers? [...] I Answer, It is his either by Creation Right, or by Right of Conquest: If by Creation Right he call the earth his and not mine; then it is mine as well as his, for the Spirit of the whole Creation, who made us both, is no respecter of persons. And if by Conquest he call the earth his and not mine, it must be either by the Conquest of the Kings over the Commoners, or by the Conquest of the Commeners over the Kings.[1455]

Like the Diggers, the *Ranters*—known for their wild arguments— were pantheists. Cohn says, that at "the same time [as the Diggers] the groups of religious enthusiasts multiplied exceedingly," and that the Ranters "became very numerous."[1456] But, despite their shared pantheism, Winstanley and the more culturally-conservative Diggers would often criticize the Ranters, such as Laurence Clarkson, for their libertinism. And libertine they were,[1457] well known for their promiscuity and moral relaxation.[1458] But they were also free thinkers, critical of authority, and got their name from their proclivity for public rambling and debate. Aside from Clarkson, other prominent Ranters included the blasphemous

---

[1450] The popular English comedy, *Monty Python and the Search for the Holy Grail*, features peasants who declare themselves an "anarcho-syndicalist commune," while they are digging in muck, an allusion to the Diggers

[1451] The True Levellers (or Diggers) represent something of an early utopian or proto-socialist movement. Like many of the Christian socialists that preceded them, and those with us still today, like the Hutterites, they practiced communism.

[1452] Jacob, 43

[1453] Jacob, xii

[1454] Cohn, 288

[1455] Winstanley

[1456] Cohn, 288

[1457] With free thought and antinomianism came an increase in libertinism, which was often expressed in the form of anticlericalism, anti-establishmentarianism, and eroticism, sometimes to the point of hedonism, debauchery, and complete amoralism, as with the Marquis de Sade, the namesake of *sadism*. While this was more common among the atheists and even some of the deists of the time, pantheists such as the Ranters had also been quite libertine (others were conservative, sometimes very). The Ranters, themselves influenced by the Heresy of the Free Spirit, represents both a highly libertine and pantheistic movement, incorporating sexual deviance with direct revelation. Many of the views held by such heretics were used to challenge established moral authority, and sometimes mingled with sexual and behavioral libertinism.

[1458] This sort of libertinism should not be confused for intellectual libertinism

pantheist Jacob Bauthumley, the egalitarian heretic Abiezer Coppe, and the vegetarian John Robins. Like the Diggers, they had much in common with the prior Heresy of the Free Spirit.

The Ranters and Diggers had been preceded by the Seekers and other religious dissenters whom they also existed alongside. The *Seekers*—seeking religious truth, or God— were likely inspired by the anti-trinitarian preaching of three brothers, Bartholomew, Walter, and Thomas Legate, possibly Socinians. They believed all organized churches of their time to be corrupted and instead relied on internal revelation from God, holding that every person must find their own way to God. They believed in a voluntary community free from coercive control, and supported a pluralism of ideas and freedom of thought. Conner says that, to "these Seekers, Ranters, and Diggers, and other radical sectaries, science did not exclude social concerns, and its essence was not neutrality."[1459] Bartholomew would be burned at the stake.

Practicing a form of quietism in their assemblies, many Seekers would go on to become *Friends*, or *Quakers*. The Quakers, or Friends, were started by George Fox, a weaver's son. In North America, the *Quakers*, practitioners of quietism and consensus decision-making, had become particularly radical. In Pennsylvania, they refused to pay taxes for quite some time, leading some historians to describe the time as a period of relative anarchy. When the Federalists had put together their Constitutional Convention, the Quakers of Rogues Island refused to attend. The American frontiers would continue to have libertarian or anarchic elements to it for some time into the future.

Other dissenting groups included the aforementioned Unitarians, Universalists, and Anabaptists, as well as Puritans, Brownists, Sabbatarians, and more. Dissent was especially strong among textile workers.

Modern radicalism was not unique to the religious dissenters, but can also be found among free thinkers, who tended to distance themselves from religion and who preferred to focus on natural philosophy and science. In many versions of the story, free thought is addressed retroactively through history, with the heretics and martyrs for science, such as Giordano Bruno, considered to be early free thinkers. For some, the execution of Giordano Bruno marks the official beginning of the free thought movement. But it would be the Spinozan pantheist John Toland who would first receive the label *free thinker*. And it is not unusual to consider his own influences, the circle around him, and others like him in this *milieu* with him. For this reason, the *tradition* of free thought—that is, the group effort toward this end—would begin with a core of people such as John Toland, Matthew Tindal, and Anthony Collins. This core would be followed by a myriad of free thinkers in the Radical Enlightenment.

Free thought was related to *freedom of conscience*, the ability to hold one's own beliefs, but more specifically to deny religious dogma and demand logical or sensory evidence. This was the Radical Reformation position that one should be free to exercise one's own conscience as one sees fit, to believe what one wants to. This was also associated with the current of *intellectual libertinism*. Freedom of conscience is separate from, but provided a foundation for *freedom of speech*, the view that one should be free to speak one's conscience.

Free thought was not just about being able to freely explore ideas and speak one's mind—though it certainly overlaps with these—, but was also about demanding that ideas be defended in a rational manner, through logic and reason, rather than relying on religious dogma taken simply on faith. Free thinkers generally opposed institutionalized religion, believing instead that Nature provided a means of

[1459] Conner[1], 358

direct knowledge about creation. Philosophers like Raymond of Sabunde, an early or proto-free thinker, and author of *Natural Theology*, had pressed that Nature is a divine revelation similar to the Bible.

Even while remaining critical of religious dogmas floating on assertions taken on faith alone, and even while taking at times to irreligion, some of the most rational defenses of religion or spiritual beliefs also came out of free thought, as can be found in the writings of John Toland and Matthew Tindal, writings such as *Christianity Not Mysterious* and *Christianity as Old as the Creation*. Free thought did not exclude Christianity or Christians, but included many Dissenters. Unitarians such as Fausto Socinus and Michael Servetus are considered to be free thinkers, as were Richard Price and Joseph Priestly. Those among the Diggers, the Ranters, the Seekers, and the Quakers might also be considered free thinkers to some degree or another, depending on the person in question.

Nonetheless, free thought did tend toward the secular, favoring natural philosophy to religious testimony, and, as such, it did contain mechanistic views like deism, or those of atheists and atheism in its ranks, often inspired by Thomas Hobbes or even further back by Epicurus. While pantheists such as Bruno, Spinoza, and Toland had been the backbone of the early free thought movement, their own positions would become more and more considered atheistic heresy, such that some authors, such as Jonathan Israel, consider pantheists such as Spinoza to be more-or-less *crypto-atheists* as they had been accused.[1460]

Free thought was not always coldly objective, though it could have its moments. The life and freedom of the individual, and the social sanction thereof, was of great importance to the free thinkers, as was the concept of *virtue* and living a good life. John Toland, for instance, tells us, as quoted by Paul Harrison in "Toland: father of modern pantheism," and in the manner of the Wisdom tradition, that

> Virtue alone is enough to live happily and brings its own reward. The wise *prefer* pleasure to profit. It is better to never command anyone, than to obey someone.[1461]

Free thinkers themselves almost always tended toward democratic republicanism or anarchism in "politics," and stressed the importance of tolerance and learning about alternative viewpoints. This was to allow for relative or subjective differences, even while not submitting that the entirety of reality is subjective. Just as well, free thinkers such as Spinoza had— as Susan James makes clear in her "Narrative as the means to freedom: Spinoza on the uses of imagination"[1462]— seen great importance in the use of the imagination for sociopolitical reasons. The imagination, individual priorities, tastes and preferences, etc. were all considered legitimate aspects of existence, worthy of consideration to the point that the entire political system needed to change.

The need for change being so, the free thinkers formed the core *intelligentsia* of the Radical Enlightenment. Bruno had been executed prior, and Spinoza had taken to promoting not only pantheism, but democratic political change executed through organized secret societies. John Toland had apparently taken him up on that, himself having taken to forming secret societies that, according to Margaret C. Jacob, represent proto-Masonic organizations. Joseph McCabe, much earlier, similarly cites "a French author" as saying that John Toland formed a secret society that had Anthony Collins, Matthew Tindal, and David Hume, among others, as members, called the *Pantheisticon* such as Toland's book. He suggests that this was the model for the beginning of speculative Freemasonry.

[1460] Nonetheless, Spinoza's neutral monism, organicism, and psychophysical parallelism suggest that his position is more in line with his pantheist predecessors than with the atheists, who were prone to substance pluralism or materialistic monism, physicalism, and determinism

[1461] Harrison[2]

[1462] See James[1]

Republican secret societies would both drive the early Radical Enlightenment and inspire the Moderate Enlightenment. The Radical Enlightenment would become even more radical come modernist[1463] political philosophies, when working class republicanism developed into Mutualism, longing for a democratic republic of industry.

Free thought was growing, and such figures as Diderot would comment on the growing deism, atheism, and pantheism that marked the philosophical interests among liberals and radicals of his time. Freedom of thought would be important to those heretics and radicals in the artisanal and peasant classes, and this would seem especially so among the weavers, who seem to have been a perennially rowdy bunch. Pantheism, agnosticism, atheism, naturalism, skepticism, empiricism, rationalism, republicanism, liberalism, radicalism, libertinism, and all manner of free thought made its way into the discussion, across national borders and often language barriers, in the letters of the Republic, the lodges of the Masons, and the salons and coffeehouses, "third places" that served the lower nobility, gentry, burghers, and merchants that generally participated in the discussions of the Enlightenment.

Ideology would begin to emerge, first being named as such by Antoine Destutt de Tracy, who conceived of ideology as the "science of ideas." One might consider ideology in contrast to geology or biology. Where geology is the study of the Earth, and biology is the study of living things, ideology is the study of ideas. Just as one sorts and categorizes and discovers the origins of rocks in geology, ideology, as conceived by de Tracy, was the sorting out and categorization and coming to know the origins of ideas.[1464] This represented a step in the Art of Memory, following Petrus Ramus, toward coherence of ideas over segmented bits of apparent wisdom. De Tracy believed that ideology would allow one to understand the source of their ideas and thereby to judge them according to their merits, holding that this would calm the threats of ignorant mobs. Ideology was also supposed to be a replacement for theology. Indeed, up until the Enlightenment, political ideologies did not exist; religion and kinship was the political unifier for most of the ruling class and its subjects. One fought under the banner of a given royal or noble household, the cross of the Church, or etc. Only after the Enlightenment did political ideologies really appear as such.

If the free thinkers represent the more materialist or rationalist side of the transition from Radical Reformation to Radical Enlightenment, the Nonconformists and Dissenters represent their religiously-persistent, and often Romantic cousins. And as the free thinkers would be responsible for the Radical Enlightenment, it was these nonconforming and dissenting Anabaptists and Protestants, hangovers from the Radical Reformation, who were responsible for the Great Awakening, particularly Radical Awakening. One important point of agreement between these two groups is the separation of church and state; another is religious freedom. On these points the free thinkers and the religious nonconformists of the Great Awakening could agree, and could come to coexist with one another over time (with some friction, of course). This *would* take time though, as, even within the context of religious freedom, even the various denominations of Christianity had a hard time keeping things fully civil with one another.

[1463] *Modernist* because they are in favor of continuing modern or Enlightenment attitudes to social change; that through the use of Reason, society can be made better for everyone

[1464] That there are many competing ideologies is no different from there being competing geologies and biologies; Mantovani's geology is much different from Wegener's, and Lamarck's from Darwin's views on biology. These are competing understandings, no different from those existing between ideologists.

Rosicrucian Enlightenment

Around the time of the Reformation, and as a part of the Counter-Reformation and Scientific Revolution reaction to free thinking and religious dissent, various groups were formed that would be associated to various degrees with esotericism, or would inspire esotericists later on down the road. Frances Yates has referred to this time, specifically speaking of the Rosicrucian Order, as the "*Rosicrucian Enlightenment*," but I believe it must go beyond this to include the Jesuits and the Capuchins, if not more, themselves preceding the Rosicrucians by some time.

The *Jesuits*, or Society of Jesus, are a Catholic religious order established by Ignatius of Loyola and his companions. They are focused on intellectual pursuits, education, research, etc. and minister to others. The Jesuits are characterized by *Ignatian spirituality*, the goal of which is to "conquer oneself" and to "find God in all things." They are led by a Superior General who is elected by the General Congregation for a life term, and have been criticized for seeking power, being the focus of many conspiracy theories, including the *Gunpowder Plot*, an attempted assassination of Protestant aristocrats. Jesuitism was a force of the Counter-Reformation.

The *Capuchins*, or Order of Friars Minor Capuchin, are a religious order of Franciscan friars formed by Matteo da Bascio that wanted to return to the Strict Observance of Francis of Assisi, the founder of the Franciscans. They were forbidden from handling money and had to beg to survive, being also forbidden from wearing shoes. They were a major part of the Counter-Reformation.[1465]

The *Rosicrucians*, or the True Society of Jesus and the Rosy Cross,[1466] are an esoteric Christian spiritual movement and mystery tradition, associated with a number of organizations, largely aligned with Lutheranism, and reportedly but erroneously established by Christian Rosenkreuz. In the *Rosicrucian Manifestos* that announced the existence of Rosicrucianism as an order with ancient wisdom, a cultural excitement was developed, wherein many sought to discover the secrets reportedly held by the Rosicrucians. Michael Maier claimed that Rosicrucianism had ancient origins going back to Egyptian, Indian, Persian, Greek, and Arabic sources. The Rosicrucians made wide use of Hermetic and Kabbalistic ideas, and promoted a science of discovery, as well as utopian ideas that would eventually become influential on Romanticism and socialism. The idea of the Rosicrucians gave rise to the Invisible College, the precursor to the Royal Society, a scientific society still active today. The Invisible College, centered around Robert Boyle, was a learned society of natural philosophers who met regularly and exchanged letters. It inspired, in part, the Republic of Letters that would be so important during the Enlightenment.[1467] Rosicrucians wanted knowledge to ultimately be accessible to everyone, but believed people needed to be pure of heart first. People associated with the origins of the Rosicrucians have included the magician John Dee,[1468] Cagliostro, and the mechanical philosopher Francis Bacon, but figures important to the Rosicrucian Enlightenment included Michael Maier, Elias Ashmole, Teophilus Schweignhardt Constantiens, Gotthardus Arthusius, Julius Sperber, Henricus Madathanus, Gabriel Naude, Thomas Vaughan, George von Welling, and Hermann Fictuld, among many others. Comenius was influenced by the manifestos and developed his concept of the proto-encyclopedic *pansophism*, the

[1465] One of their members, Bernardino Ochino, left Catholicism and was accused of preaching Unitarianism.
[1466] Notice the "Society of Jesus" reference to Jesuitism and the "Rosy Cross" reference to what would become known as *Luther's Rose*
[1467] Two of the earliest known Freemasons, Robert Moray and Elias Ashmole, a natural philosopher and an occultist, also participated in a meeting that would lead to the Royal Society.
[1468] David Wilcock argues that the rulers practice black magic and have done so at least since John Dee rediscovered how to do so from his readings from the Vatican

idea that everything should be taught to everyone. Others influenced include Tomasso Campanella and Robert Flood, among many others.

LaRouchean scholars, such as Gerald Rose, have tended to connect the Rosicrucians with the Venetians, who play a central role in their conspiracy theories. Gerald Rose says that

> It was Cusa, with the help of Pius II, who created the basis for a war on the pagan idea of man as a beast, and to defend the concept of man as *imago Dei* and *capax Dei*. It was the power of these ideas which caused the greatest increase in human population in the history of man. This idea of the power of hypothesis and its relationship to transforming nature proved conclusively that man was fundamentally different from the beast, and as such could not be used as a slave. Venice reacted wildly against the ascendancy of this idea. With the papacy in the firm grip of Pius II and Cusa, Venice launched a war to destroy Christianity[1469]

Gerald Rose says that "Venice manipulated both the Reformation and the Counter- Reformation, leading to a series of wars which drowned the Renaissance legacy of Cusa," culminating in "Thirty Years' War."[1470] He says,

> The League of Cambrai, representing the total combined power of Western Europe, is called upon by the papacy to crush Venice. At the Battle of Agnadello, the Venetian forces are completely destroyed. France is poised to invade the very islands that comprise Venice to deliver the *coup de grace*. The papacy relents, fearing a war that will be fought on Italian soil by foreign troops. Several times before, such troops had seized parts of Italy. In a series of diplomatic moves, the alliance falls apart, and, miraculously, Venice is saved.
>
> Venice, which worked with the Turks to create a republic of usury and slavery; Venice, the slave trader of Europe, so close to being destroyed, survived. Its survival would now wreak havoc on Western civilization.[1471]

Rose says, "Sarpi and Venice create the Rosicrucian cult of syncretic religion that becomes Freemasonry. Once that process of takeover is complete, England becomes the bastion of paganism: usury and slavery." "Out of the Giovani salons and secret society [led by Paolo Sarpi]," he says, "Venice planned the destruction of Christianity in what was later to be called Freemasonry." Indeed, he says that "a modem historian by the name of Wooton proves that Sarpi was the creator of empiricism and taught Francis Bacon his so-called scientific method."[1472] According to LaRoucheans such as Gerald, it is the Venetians who are really responsible for leading what would later be formalized into the *synarchy*, too, the rule of the world by a secret technocratic government. Anticipating the approach that the synarchy would take, Rose informs us that

> You can never understand Venice by studying what positions the Venetians took on an issue. The Venetians did not care what position they took. They always took all positions. Their method was one of looking for the weak point and corrupting the person. At this form of evil, they were the masters. Their diplomatic corps was the best in the world at the time, and the British diplomatic corps was trained by the Venetians.[1473]

[1469] Rose[2]
[1470] Rose[2]
[1471] Rose[2]
[1472] Rose[2]
[1473] Rose[2]

LaRouche himself likes to speak of this kind of approach as being a "slime mold," capable of taking whatever form is necessary. Indeed, if this is the approach that the Venetian intelligentsia took—an approach that seems eerily similar Tengrism, by the way—, the Venetian approach to politics does seem to prefigure the politics to come, today's leaders being especially good at "shape shifting," infiltrating or "penetrating" other organizations, and name stealing in the process, presenting themselves as Left, Right, Center, and anything else they can. Venice would surely have its impact, becoming a monopolistic force of trade in the Mediterranean. In the end, however, Rose suggests that it would be Cusa who would destroy the power of Venice.

It is important to remember, the above story having been told, that speculative Freemasonry likely has a number of origin points, depending on where one draws the line. Margaret C. Jacob suggests that the line might be drawn near John Toland and his Knights of Jubilation,[1474] but many other scholars, including Manly P. Hall, have suggested that it should be drawn around Francis Bacon. Rose, too, seems to connect Freemasonry with Bacon, by way of Rosicrucianism. But this would be locating Freemasonic origins within the Rosicrucians, who were likely not the originators, but the infiltrators, of Freemasonry, if we consider Margaret Jacob's (and Joseph McCabe's) origin story seriously, as I do. The reason I take this origin seriously is that it appears that the original Masonic goals were Radical Enlightenment goals, as Jacob suggests, and that these goals were at odds with those of the Rosicrucians, who represented a Counter-Enlightenment or Counter-Reformation force. It was not really until the establishment of the Grand Lodge of England that Freemasonry started to really take on hierarchical degrees, having only really had the Entered Apprentice and Fellow Craft degrees beforehand. Master Mason, which involved the rituals surrounding the character of Hiram Abiff, and those involving secrecy and death threats, were not likely known to those Masons before that or those who persisted in flat-structured Freemasonry after the establishment of the Grand Lodge of England or those like it, which endured for quite some time. These Masons, instead, met "on the level," and their lodges were autonomous rather than subject to the governance of the Grand Lodge. Nonetheless, Rose tells us that Sarpi is the "real founder of modernism and the Enlightenment," and that he "created [...] Freemasonry," going on to damn Giordano Bruno along with the Rosicrucians, as if they were on the same side.[1475] It is unfortunate that the Radical Enlightenment and the Moderate Enlightenment have been conflated for so long by scholars who otherwise have important things to teach us about.

These groups—the Jesuits, Capuchins, and Rosicrucians— have all been suspected of having a major and secretive role in European and international politics associated with a New World Order. The New World Order, as is being pursued by the various Rosicrucian groups and their affiliates, may best be understood in comparison to the Old World Order. The Old World Order was the longstanding and ancient system of patriarchy, whereby the firstborn son received the family inheritance, including any political power and property, as well as, if one was a royal, the "right of first night," *ius primae noctis*, or *droit du seigneur*, "the lord's right." Younger sons and brothers, the second-, third-, and fourth-born, often went without inheritance, being compelled to join the clergy. Many of these young men would go on to join religious military orders, such as the Knights Templar, Knights Hospitaller, Teutonic Knights, the Order of Saint Lazarus, or etc. They were oftentimes celibate, in accordance with the expectations of piety and traditions within esoteric Christianity, and may have expressed homosexuality as a result. The Templar emblem, two knights sharing a horse, for instance, was said to represent the piety and voluntary poverty of the Order, but it is more likely that it represents the involuntary poverty of younger brothers, and perhaps also their homosexuality. Whatever the case, the Old World Order would come to be opposed by knights in search of a New World Order, taking the form of a neo-Platonic or Gnostic,

[1474] Presumably referring to *Jubilee*
[1475] Rose[2]

perhaps Manichean, oligarchical communism. Similarly to the overthrow of alpha male Hominids by fraternities of beta males, fraternities of these younger brothers—left without an inheritance, which would all go to their older brothers—, having no stake in the existing order, would put their efforts toward conquering it. The New World Order, though, is a revolt from within the ruling class, an ongoing *coup* or "palace revolution" of sorts. At first, it was about younger brothers, but has since opened to other interest groups within the ruling class, including women, gays, crossdressers, and people of mixed race, all seeking to have a maximized influence within the ruling class, which has tended to maintain, like the working class, at least some degree of inner conservatism. Rocker says that

> According to the doctrines of the church, monarchy was a God-instituted state form, but the temporal ruler was given his power only to protect the cause of the faith, which found its expression in the doctrines of the church. Hence, Providence had set the pope as ruler over the kings, just as these had been set as rulers over the people. And just as the people owed the prince unqualified obedience, so the commands of the pope were the highest law for the rulers. But now the spreading Protestantism had destroyed the old picture, and veritable heretics sat on princely thrones as representatives of the highest powers of state. Under these circumstances the relationship of the Catholic Church to the temporal power also had to change and take on other forms. Its attempt to adapt its practices to the new social relationships in Europe and to collect its scattered forces into a strong organization ready for action and capable of meeting all demands, had thoroughly revolutionary results. The church's representatives now had no compunctions about flirting temporarily with democratic ideas if their secret aims were thereby furthered.
>
> It was principally the Jesuits who broke ground in this territory. Thus the Spanish Jesuit philosopher, Francisco Suarez, opposed the doctrine of the divine right of kings on fundamental principles and, quite in the sense of the "natural rights" traced the relationship between prince and people to a covenant which imposed on both parties rights and duties. According to Suarez, power cannot naturally remain in the hands of a single individual, but must be partitioned among all, since all men were equal by nature. If the ruler did not conform to the covenant, or even opposed the inalienable rights of the people, the subjects were given the right of rebellion to guard their rights and to prevent tyranny.
>
> [...]
>
> Even further than Suarez went his brother in the "Society of Jesus," Juan de Mariana, who in the sixth chapter of his voluminous work, Historia de rebus Hispaniae, not only justified assassination of the covenant breaking kings as morally right, but even suggested the weapon with which such murder was to be committed.[1476]

The Old World Order, however, was laid to rest not by these jealous elite aristocrats, but by participants in the Radical Reformation. The New World Order crowd is not from the Radical Reformation, but instead from the Radical Counter-Reformation. Being opponents of the Old World Order, they maintain a rebellious flavor that is appealing to radicals, but they are nonetheless aristocratic and generally not truly democratic or anarchic.[1477] However, now and again, one of them lets their conscience "take the wheel" on a given matter.

[1476] Rocker[1]

[1477] These radicals of the Counter-Reformation, these New World Order types, have had their main competition—the Old World Order— removed, and have since set their efforts against the Enlightenment, especially the Radical Enlightenment; the result of which was the Moderate Enlightenment. The Moderate Enlightenment is the terrain of the *bourgeoisie*. Another way to phrase it, then, is that the New World Order is an effort of Old Money, New

The *General Crisis*, a period of worldwide trouble with economic collapse, pandemic, and widespread warfare, had likely been kicked off by climatic change ("Acts of God"), such as a "Little Ice Age," and coordinated activities (by way of astrology or astronomy). *Acts of God*, such as climate catastrophes, allow knowledgable political speculators to get an upperhand on the situation, and thereby to dethrone opponents or establish dominance. The General Crisis was likely an instance of this, and saw a second plague epidemic and the destruction of both the Holy Roman Empire, which ended up taking two centuries, and the Ming Dynasty in China, which was more immediate. Around the beginning of the Crisis, Jesuits and Capuchins would make their way toward Qing China and Tibet, which had been claimed by the Qing dynasty, but were expelled by Tibetan lamas and had some difficulty with the Manchu Qing. The Rosicrucians, too, are said to have moved Eastward around the beginning of the Crisis. This gives rise to the concept of the *Great White Brotherhood*, or *Universal White Brotherhood*, a concept first popularized by Karl von Eckartshausen, and the Society of Unknown Philosophers promoted in Martinism and talked about by people such as Madame Blavatsky and Manly P. Hall, and associated with the teachings more recently of Omraam Mikhael Aivanhov. The General Crisis would see the transition from feudalism to mercantilism.

Did the Drokpa or Brokpa people's love of flowers, in connection with Jesuits and Capuchins visiting from the West, have anything to do with *Tulip Mania*, the tulip craze in the Netherlands just before the *General Crisis*, the first financial crash in history? Interestingly, the first tulips grew where Tibet and China meet Afghanistan and Russia. The Drokpa people love flowers, and are well-known for their flowery hats. Steppe peoples, such as the nomadic ancestors of the Turks, had come across these tulips in times of Spring, when the harsh winter was over, and so became an important symbol for the Drokpa. Drakpa Jungne, of Drokpa heritage, was a King of Tibet, his family being influential until the 17th century.

The Kingdom of Guge in Western Tibet, perhaps the center of Tibetan Buddhism, was visited by Jesuits around the time of the Treaty of Westphalia, and collapsed not long after due to a conflict between two brothers, one the secular and the other the religious leader. Guge was something like the Vatican of the East. The Jesuits had been commissioned to teach Christianity by the secular ruling brother, which prompted sympathy for the religious leading brother by outside forces, who overwhelmed Guge and led to its collapse. The Jesuits had stumbled upon Guge after searching for an apparently ancient Christian city associated with Shambala. Shambala is said to be the home of the ruler of the world, and is often mythologized as having existed in an aetherial realm or in the sky. It was associated by theosophists like Madame Blavatsky and by Manly P. Hall with the Ascended Masters, Masters of Ancient Wisdom, or the Great White Brotherhood. The White Brotherhood would find an especially stable stronghold in Tibet, perhaps among a Denisovan- and Capoid-related would-be "ruler of the Universe," even considered by some of them to be "God" in the ancestral sense.

Approaching the Certain and the Concrete

Free thinking among the radicals, while itself an outgrowth of rational mysticism, green magic, and natural philosophy, had tended to move away from apophatic theology, sensationalism, and speculation toward kataphatic pantheism, direct realism, and concrete comprehension. This marked a step in cognitive development. For John Toland, to give an instance, common sense rationalism was the key to free thinking, and so also to a sound philosophy. He says, in *Christianity Not Mysterious*, that

---

Ideas which is set against everyone else, the Old Money, Old Ideas people (the conservative Counter-Enlightenment), the New Money, Old Ideas people (the Moderate Enlightenment), and also the No Money, New Ideas people (the Radical Enlightenment). The New Money, New Ideas people? They are the henchmen for the Old Money, New Ideas people.

> *when we have no Notions or Ideas of a thing, we cannot reason about it at all; and where we have Ideas, if intermediate ones, to shew their constant and necessary Agreement or Disagreement, fail us, we can never go beyond* Probability. Tho we have an Idea of *inhabited*, and an Idea of the *Moon*, yet we have no intermediate Idea to shew such a necessary Connection between them, as to make us certainly conclude that *this Planet is inhabited*, however likely it may seem. Now, *since PROBABILITY is not KNOWLEDG, I banish all HYPOTHESES from my PHILOSOPHY;* because if I admit never so many, yet *my Knowledg is not a jot increas'd*: for no evident Connection appearning between my Ideas, I may possibly take the wrong side of the Question to be the right, which is equal to knowing nothing of the Matter. When I have arriv'd at *Knowledg*, I enjoy all the satisfaction that attends it; where I have only *Probability*, there I suspend my Judgement, or, if it be worth the Pains, I search after Certainty.[1478]

From the above, we might infer that someone like John Toland might today see a field such as quantum mechanics or theoretical physics as no different from religion. In a manner similar to Thomas Reid, whom Toland anticipated, and following after Spinoza, the focus was placed on common sense or direct-realism, upon self-evident and observable facts, and deductions therefrom.[1479]

While mysticism and magic of the rational and green sort had kept within the bounds of Nature, its offspring, free thought, had stepped away from the *preternatural*, or Nature conceived as being magical or mysterious, and toward the *hypernatural*, or understanding the nuts and bolts of what otherwise seemed to be a quasi-natural mystery. The free thinkers, starting with Spinoza perhaps, mark a step away from mysticism in the sense of something that is forever unknowable in a preternatural sense, and, in large part, as a step away from authoritarian elements in mysticism and religion. While rational mysticism and green magic were not necessarily outside of the bounds of naturalism— in that they explored mystical and magical qualities of Nature—, free thought largely focused on the possibility of abolishing the element of suspense that was found mystical or mysterious. For the free thinkers, by engaging Nature with common sense, and through the use of Reason, certitude could be produced, the *negation* of mystery or of mystical thinking, in the sense of engaging the unknown. Out of their new outlook, the free thinkers produced certainty of what had otherwise been magical suggestions. Whereas magic and mysticism suggested certain actions, it could not explain the reasons for the results. Free thought was different, because it demanded a *sufficient reason*, an explanation, or at least that such an endeavour, if taken to task, was certainly possible, and perhaps even inevitable. But, at the same time, it is not unfair to suggest that the free thinkers were at the pinnacle of rational mysticism and green magic, such that they could close the chapter on that story and move on to greater degrees of certainty. At the same time, the free thinkers maintain the core of rational mysticism, green magic, and especially natural philosophy that permeated the medieval pantheist outlook of people such as Eriugena, Giordano Bruno, and the like, holding to ideas such as those found in Matthew Tindal, when he speaks, in *Christianity as Old as Creation*, of a "Reason of Things, or the relation they have to each other." Tindal says, quite magically, that "there is a God infinitely happy in himself, infinitely good and wise;

[1478] Toland[2]

[1479] "Quantum mysticism" of the New Age sort, or even of the sort coming from out of CERN, might suggest to Toland that there is a serious disconnect from Nature, and that priestcraft had shifted from the pulpit in the church to the podium in the classroom. In this way, John Toland and the free thinkers were anticipants of the Realism of people such as Thomas Reid, Gustave Courbet, Mary Wollstonecraft, Jane Austen, and others who opposed the onset of Romanticism's sensibilism, sensationalism, emotionalism, and etc., emphases that would ultimately culminate in postmodernism. Postmodernism especially would push against the certainty desired by the free thinkers, the postmodern era producing the "uncertainty principle" of standard quantum mechanics, as suggested by the Nazi scientist Heisenberg. Free thinkers admit uncertainty, often being agnostic, though they seek certainty.

and as God can design nothing by his laws but our good, so by being infinitely powerful, he can bring every thing to pass which he designs for that end." His reasons for this quasi-magical belief are quite rational, however, and it is that he dares to offer reasons grounded in common sense and rational explanation that sets him apart from the prior mystics and wizards; he is a common sense rationalist. Quite similarly, and as quoted by Paul Harrison, Toland expresses rational mysticism in his philosophy, suggesting that

> Nothing dies totally, the death of one thing brings the birth of another, by a universally reciprocal exchange, and everything contributes necessarily to the preservation and welfare of the Whole by a continual change of forms and a marvelous variation which forms an eternal cycle.
>
> The years that Nature accords to each one on earth should seem sufficient to him.
>
> The person who is worried that he will not be alive in a thousand years is as foolish as he who would be worried that he was not born 1000 years ago.[1480]

The Universe as understood by the free thinkers still had something of a mystical or magical element, in that the Universe still conspired in a way[1481] to provide for humanity, a sentiment foreshadowing modern cosmological ideas such as the *anthropic principle*; but this was not an insight that required blind belief or witnessing without explanation, the way that magic or mysticism did, it was something that was able to be defended on a rational basis, not just through direct experience of God and God's creation, but also by observing and understanding Nature and using one's capacity for Reason to its fullest. Through the use of Reason— and in the vein of Nicholas of Cusa— one became closer to God; and thereby garnered more success in life, at the very least to be found in contentment and love of God and Nature, which were often seen as synonymous, as had been the tradition of free thinking pantheists since Eriugena if not before. While rationalism led to the rejection of religious dogma, in the hands of the free thinkers it could also affirm a spiritual or perhaps even religious worldview, especially as espoused by prior pantheists like Eriugena and Nicholas of Cusa.

In a way, *philosophy* represents an attempted escape from *mysticism*, in the sense of a life ruled by mystery, and toward *wisdom*, its abolition. The *mystic* recognizes the mystery inherent in Nature, the *philosopher* recognizes it but moves to remove it, and the *sage*, if he or she really exists, has in fact removed the mystery by accomplishing what the philosopher has set out to achieve. At the same time, if *mysticism* does not simply mean the submission to mystery, but instead the attempt at "mystical union with the divine," *henosis*, *gnosis*, or other such concepts as these, the philosophers and sages are certainly to be counted among the mystics, even in the absence of any celebrated mysteries. It is in this sense that the free thinkers, pantheists like Spinoza and Toland and deists such as Collins and Tindal, with their minds aligned with Nature better than any others of their time, *must* be counted among the mystics, for alignment of one's own mind with that of the Divine Mind of the One is nothing short of a mystical union, and produces nothing short of what has been mistaken by the inadept as miraculous. If

---

[1480] Harrison[2]

[1481] Of course, this is not to be mistaken for a sort of New Age or Mesmerist view, which suggests "positive thinking" to the excess and to the neglect of the negatives in life. Rather, the pantheists, such as Spinoza and Toland, hold that even the negative things in life are of some benefit, because they believe in the concept of the *Best Possible World*. Their acceptance of the negatives in life is both what allows them to deal in Realism and science, even while staying optimistic, as well as giving reason for their association, according to some, with Luciferianism, a view which tends to accept the darkness or evils in life as an essential or necessary ingredient in existence, or as part of God's creation or perfection. It must be remembered that there are two sides to Luciferianism; an elitist side that wants to control knowledge and a liberatory side that wants to make it widely available. The latter is arguably the truer form of Luciferian, with the former being inconsistent and anti-Promethean.

the sage has accomplished what the philosopher set out to achieve, the free thinker, by aligning their mind with Nature, accomplished what the mystic had set out to achieve, a unity with the One.

In a sense, the free thinkers maintained a plain reading, similar to the Karaites or Anabaptists, of religious texts like *The Bible*, yet they were aware of the mystical and occult elements behind this plain reading, understood to represent an exoteric message, as well as of the human flaws involved in such an endeavour. These occult elements did not necessarily change the meaning of the text in the sense that the plain reading was nullified—as many esoteric interpretations do, by completely changing the meaning—, but in the sense that a richer understanding of the plain text was presented, an understanding that did not create further confusion, as with the case of many exoteric interpretations, but which instead would shine light on the matter. In this way, free thinkers, often coming out of Anabaptism but exploring Christian mysticism and paganism, melded these working class and sometimes elitist perspectives with natural philosophy, presenting something more overarchingly humanitarian. And their associations, which melded magic-styled or mystery school-like ritual and theatric gatherings—choreographed assemblies— with values of congregational organization and primitive Christianity—both understood from the rationalism of the free thinkers—, demonstrated quite well the merging of the two major radical religious influences leading into free thought; namely Renaissance paganism or Christian mysticism and Radical Reformation Anabaptism and primitive Christianity, which would be interpreted by the free thinkers through the lens of natural philosophy, or Reason.

The plain reading of Anabaptism of the exoteric text, combined with the esoteric understanding of the rational mystics and green magicians, both filtered through natural philosophy, gave way to a rich pantheist Christianity that saw God and Nature as synonymous, thereby providing a magical and mystical foundation that could nonetheless be grasped through Reason and serve as a foundation for direct realism and common sense rationalism, rather than being antagonistic toward these.

Science also developed further with the rationalism of the free thinkers, as well as all of the fruits she had to offer, such as astronomy, geology, physiology and medicine, botany, and so on, themselves largely progressions from green magic and natural philosophy, but also from the intuitionism of the mystics. But although these had grown from mysticism, magic, and even some philosophical speculation, free thought would put new demands and new quality controls that were not present in medieval thinking.

It is in this way that free thought represents the closing of the chapter on magic, mysticism, and authoritarian religion, but only because of its having mastered their methods and achieved their goals, of influencing the world according to the will and uniting oneself with God or God's will.

Christianity Not Mysterious, but Old as Creation?

Modern deism has its foundations in free thought, alongside pantheism. Like pantheism, it has been given mechanistic forms at times, but this is not always or essentially the case, nor was it really at the foundation of deistic thinking, which, as with modern pantheism, and perhaps not entirely separate from it, but in fact related, acknowledged both mechanistic and mental laws, as with an organic and monistic approach to Nature.

Deism might be said to refer to a rational understanding of the Old Religion as underpinning interpretations of *The Bible*. Jesus, for example, had spoken of God as a Father figure that resides in

Heaven.[1482] This has been interpreted by many as a rejection of an immanent or pantheistic deity. However, much of Christian theology is derived from that of the Ancient Greeks and Romans—Indo-Eurpean sources—, such as that of the Pythagoreans, Platonists, Aristotleans, and Stoics, which have been interpreted in a pantheistic fashion on a number of occasions.

In particular, the paternal figure of the Greeks, who had spread their Hellenism into Canaan where it stayed for a long time, was *Zeuss*, a rendering of the Indo-European *Deus*, the root word for *deism* as derived from a term that meant "shining," "the bright sky," or "to establish," but that had come to refer to a paternal deity when combined with *Pater*, meaning "father," thereby producing "Sky Father."[1483,1484] The creative, shining or daytime Sky Father of all, in Indo-European tradition, was often interpreted to impregnate the Earth Mother with his seed, the rain, and thereby to provide abundance through his potency and virility in combination of the fertility of the Earth. If we reflect on the Reciprocal Principles of Nature, suggested by Ephraim Squier as reflecting in perennial spirituality, the mutual interaction of these two sexual forces "produces" the One, grounding deism in pantheism.

With this all considered, then, it is possible to understand Jesus as falling in the train of thought of the Indo-European theologians, who emphasized the light side of pantheism.[1485] Further, we can see why the god of Jesus, the light side of pantheism, perhaps, might be understood as being a father (or alternately, if the Father is seen as being a force of the past, the Holy Spirit) who resides in Heaven.[1486] Deism, then, and if correct, would be something like a return to original Christianity, and not necessarily exclusive of, likely even having its foundations in, pantheism. Deus, the "shining one," had at one point been Lucifer, like Christ a Morning Star, and had since been demonized by the Jews.

Edward Herbert is considered the "Father of English deism"[1487] and the first true expositer of an English metaphysics. He was a free thinker and deist who tried to prove that verification through the instincts was the highest form of epistemological truth, which was contrasted against revelation, possibilities, and falsehoods. He held to a common sense rationalist notion of truth, even before Spinoza and Thomas Reid, that truth was an agreement of the faculties with one another, or a coherence, in regard to the objects of perception as conceived by the mind.[1488] He held that there were different truths to

---

[1482] In declaring a paternalistic deity, but while having favorable relations with "unclean" women like Mary of Magdelen to such proportions that feminists have suggested a Christian eschatology to Christianity despite the paternalism, there are many speculative motives to Jesus's use. It may be that he was simply speaking in traditional terms of his time, that he was indeed patriarchal as Christianity seems to be, or that he was acting in a sort of effort comparable to *detournement*, or "hijacking," as might be favorable to a feminist or anti-Abrahamic worldview.

[1483] When applied to the Norse god Odin or the Irish Dagba, this was the "All-Father." It is interesting that pantheism and All-Father are etymological synonyms, with *pan* meaning "all" and *theos* being "father." In the Ancient Greek, *pantheos*, from which *pantheon* is derived, was a reference to that which is common to all of the gods. It was not uncommon for ancient people to understand their pantheons to be something of a council of the gods.

[1484] The essence of the One was probably for a long time something under debate, as it underscores those from the very origins of Greek philosophy, the debates between Heraclitus and Parmenides, about whether the nature of existence is one of flux or permanence, both having argued for a variety of pantheism, but one a process philosophy and the other eternalist. It was from this conflict that Plato derived his conception of the "forms."

[1485] Which they equated to the paternal aspect, which would also have some relation to *theos*, from which theology is derived, itself being related to or derived from *telos* or teleology

[1486] An eschatological unity between God and the Creation, or a return to the Source, reconciling everything with Everything (if a universalist position is taken)

[1487] Despite being of a distinctly Mediterranid phenotype typical of the French, Portuguese, and Spanish, and being depicted in at least one image in something like a *yamaka* (Jewish skull cap) or *zucchetto* (Catholic skull cap)

[1488] Thomas Reid's common sense seems to follow after Carneade's treatment of the senses and their being able to either confirm or contradict one another

each of the faculties, such that there was truth intrinsic to the thing in question, truth regarding the way it appears, truth of conception, and truth of intellect. Further, these could apprehended by way of an innate and indisputable instinct, "internal senses" such as emotions and conscience, "external sense" or observation, and discourse, or reasoning. Natural instinct, however, would always be the major qualifier, against which all must be put to the test.[1489] True to common sense, and though they can be poorly exercised, the faculties, when correctly used, could be not mistaken, even in imaginings, and many of them were necessary antecedents to basic observation and experience of one's surroundings.

Far from the idea that deists do not believe in a God that intervenes in the world at all, Herbert was avid toward the idea that God answers prayers by giving signs. He appealed to an innate instinct in humans to pray and to believe in Providence. While having also been encouraged by Grotius to produce the work, he described himself having prayed for a sign to publish his book, "if it be for Thy glory," which he says was granted to him. Rather than seeing his conception of God as being that of an uninvolved deity, his critics, such as John Brown and John Leland, criticized him on the grounds that God does not submit to human requests and that his conception of God involved over-involvement. The "Father of deism" apparently did not believe that God was uninvolved in the world (or else was calling a bluff such that this would have to be refuted in order to refute him), though he denied revelation except to the individual. He held that *The Bible* was a source of great truths to "the whole inner man." Notably, Herbert's ideas had been read by Descartes.

Herbert was also a notable natural historian of religion, inspired in part by Gerardus Vossius, who had written with a scientific approach to religion as well, each referring respectively to Gentile theology and religion. Similarly, Charles Blount, a contemporary and supporter of Spinoza's, was an English deist who wrote about paganism, including an essay about the *anima mundi* and another about Apollonius, which was used to contrast against the Christianity of the Church, as Blount had believed that Christianity had destroyed rational religion. While views regarding Christianity itself were variant, the original deists were inspired by free thinking to discover in Nature that which their contemporary forms of Christianity promised but failed to deliver, particularly a coherent and consistent moral foundation. Another deist worth a mention was Thomas Morgan, as his deism was rational but nonetheless allowed for Divine Providence or Inspiration.

For Matthew Tindal, it was clear that God had put everything that people really needed into the world, and that *sin* was merely neglecting the obvious truth of this fact. Far from being an anti-religious statement, Tindal, like Toland and others among the free thinkers, sought to give a deeper understanding of the meaning of religion, and he did so through natural philosophy, namely common sense rationalism.

Free thought, as it were, was not something that was in opposition to religion, but something that grounded religion in the natural world, in God's creation, the Book of Nature, as it were, which the free thinkers tended to see, even if hesitatingly so, as a superior source of truth to "revealed" beliefs, such as those found in *The Bible*. However, in so far as holy books matched with the Book of Nature, they were legitimate. Oftentimes a plain reading, without insight from natural philosophy—which was equated with the source of the esoteric truths of the texts—, would not provide the experience of illumination that was sought by the reader. But Reason served to illuminate the reader to what was actually being said in the plain text, not by twisting the meaning of it, but by grounding it in Nature. In this way, works

[1489] Regarding study, he supported asking the following questions: Whether, what, of what sort, how much, related in what way, how, when, whence, and wherefore?

like *The Bible* were not intended to run contrary to Nature, but, quite the contrary, were intended by their authors to be objective restatements of The Book of Nature.

For this reason, Matthew Tindal wrote *Christianity as Old as Creation*, suggesting that God gave humans Reason with which to learn his laws, and that the laws and Reason predate the religion called *Christianity*, not as something different, but as Christianity before it received its name. Tindal tells us that "the Religion of Nature is an absolutely perfect religion; [...] external revelation can neither add to, nor take away from its perfection; [...] 'true religion', whether internally, or externally revealed, must be the same." He says, "if God has given mankind a law, he must have given them likewise sufficient means of knowing it; he would, otherwise, have defeated his own intent in giving it; since a law, as far as it is unintelligible, ceases to be a law." For Tindal,

> God was always willing that all men should come to the knowledge of True Religion; and we say that the Christian religion, being the only true and absolutely perfect religion, was what God, from the beginning, designed for all mankind.
>
> [...] If so, it follows that the Christian religion has existed from the beginning; and that God, both then, and ever since, has continued to give all mankind sufficient means to know it; and that it is their duty to know, believe, profess, and practice it; so that Christianity, though the name is of a later date, must be as old and as extensive as human nature; and as the "Law of our Creation," must have been then implanted in us by God himself.

He says,

> men, if they sincerely endeavor to discover the will of God, will perceive that there is a "law of nature," or "Reason" [...] which is common or natural to all rational creatures; and that this law, like it's author, is absolutely perfect, eternal and unchangeable; and that the design of the gospel was not to add to, or take away from this law, but to free men from that load of superstition which had been mixed with it, so that "True Christianity" is not a religion of yesterday, but what God at the beginning dictated, and still continues to dictate to Christians, as well as others.

Like many, if not all, of the free thinkers from Spinoza to Collins, Matthew Tindal expresses a kind of rational egoism or enlightened self-interest in his philosophy, and this amounts to a certain kind of antinomianism, or rejection of law; not those of God—for the free thinkers, if religious or spiritual, would see this as an impossibility—, but human laws. Tindal says that

> nothing can be a part of the divine law, but what tends to promote the common interest and mutual happiness of his rational creatures; and every thing that does so must be a part of it.
>
> As God can require nothing of us, but what makes for our happiness; so he [...] can forbid us those things only, which tend to our hurt; and this we are [...] certain of [...]
>
> [...]
>
> [W]e can't sin against him, but by acting against our reasonable natures.

Tindal says, putting rational egoism or enlightened self-interest behind the Golden Rule, that

> Our Reason [...] affords us the [...] nature of those duties God requires; not only in relation to himself, but to ourselves and to one another. Those [duties] we shall discern, if we look into ourselves and consider our own natures, and those circumstances God has placed us in with relation to our fellow-creatures; and see

> what conduces to our mutual happiness. Of this, our senses, our Reason, the experiences of others as well as our own, can't fail to give us sufficient information.
>
> With relation to ourselves, we can't but know how we are to act, if we consider that God has endowed man with such a nature as makes him necessarily desire his own good; and, therefore, he may be sure that God, who has bestowed this nature on him, could not require any thing in prejudice of it; but on the contrary, the he should do every thing which tends to promote the good of it.

In other words, in order to know how best to treat others, we must understand that they are, like ourselves, looking out for their own best interest, and that this is by God's perfect design, so as to encourage mutualism. We know this by looking within, itself a mystical sort of consideration, but one that Tindal trusts we, like him, have within ourselves to be comprehended.

The selfishness in humankind was not a hindrance to our getting along except in a condition of ignorance, a condition we were ourselves responsible for keeping ourselves in.[1490] In a condition of Enlightenment, people tended toward the maintenance of their mutual interests. A man, even in minimally rational conditions,

> may expect, if he breaks those rules which are necessary for men's mutual happiness, to be treated like a common enemy, not only by the person injured, but by all others; who, by the common ties of nature, are obliged to defend, and assist each other. And not only a man's own particular interest, but that of his children, his family, and all that's dear to him, obliges him to promote the common happiness, and to endeavor to convey the same to posterity.

Tindal says, "men can't live without society and mutual assistance," and that "God has endowed them with Reason, speech, and other faculties, evidently fitted to enable them to assist each other in all matters of life," and so "it is the will of God who gives them this nature, and endows them with these faculties, that they should employ them for their common benefit and mutual assistance."

Here is starting to become quite clear how the radical Christianity of the free thinkers, which had been informed by pagan green magic, natural philosophy, and also by mysticism, but which had grown toward a kind of hypernaturalism, seeing God's word as being written in The Book of Nature, was starting to put a rational basis behind the Golden Rule, and was thereby becoming consciously aware of the mutualistic basis behind reality, a basis that had been responsible for magical and mystical sentiments, but which was nonetheless fully natural and rational. Likewise, Spinoza, evoking the Golden Rule and Reason as a foundation for mutuality, in his *Theological-Political Treatise*, said that

> When we reflect that men without mutual help, or the aid of reason, must needs live most miserably [...], we shall plainly see that men must necessarily come to an agreement to live together as securely and well as possible if they are to enjoy as a whole the rights which naturally belong to them as individuals, and their life should be no more conditioned by the force and desire of individuals, but by the power and will of the whole body. This end they will be unable to attain if desire be their only guide (for by the laws of desire each man is drawn in a different direction); they must, therefore, most firmly decree and establish that they will be guided in everything by reason (which nobody will dare openly to repudiate lest he should be taken for a madman), and will restrain any desire which is injurious to a man's

[1490] A concept echoing Eriugena from his writings on predestination, wherein, building upon Saint Augustine, he distinguishes predestination from fate

> fellows, that they will do to all as they would be done by, and that they will defend their neighbor's rights as their own.[1491]

It is from within free thought especially, and among thinkers such as Baruch Spinoza, John Toland, and Matthew Tindal, but also those Dissenters they would have influence with, that conscious mutualism was starting to emerge, and that proto-Mutualism, which had inclinations toward Mutualism but did not have the rational foundations needed to be mindful enough to more fully engage it, would become self-aware, and thereby emerge from its chrysalis with the first signs of Mutualism-proper, which would find themselves among radical republicans, associationalists and producerists, and finally among self-proclaimed individualists and socialists and finally our dear Mutualists themselves.

The impetus for Mutualism was not altruism, but the awakening of the ego, of self-interest, to the benefits of sociality, a benefit that correlates with our natural desire to be liked by others and recognized for our humanity and to reflect God's perfect goodness. "[W]e see how the Reason of Things, or the relation they have to each other, teaches [men their] duty [...] to observe those rules, which make for their mutual benefit," says Tindal, but though "infinite goodness has sown in their hearts seeds of pity, humanity and tenderness, which, without much difficulty, cannot be eradicated," he says that "nothing operates more strongly than that desire men have of being in esteem, credit, and reputation with their fellow creatures; not to be obtained without acting on the principles of natural justice, equity, benevolence, etc." Tindal says,

> as nature teaches men to unite for their mutual defense[...], whoever acts what is best for himself, both in public and private capacity, does all that either God or man can require. Thus [...] we may arrive to the knowledge of our duty, both to our creator and fellow-creatures. Hence I think, we may define true religion to consist in a constant disposition of mind to do all the good we can; and thereby render ourselves acceptable to God in answering the end of his creation

Anticipating Proudhon, who viciously attacked superstition as an impediment to Mutualism—and although he, unlike Tindal, was a sometime antagonist of religion in general—, Tindal says that "not adhering to those notions Reason dictates (concerning the nature of God), has been the occasion of all superstition, and those innumerable mischiefs that mankind (on account of religion) have done to themselves or to one another."[1492] Tindal's alternative to these "mischiefs," of course, is his mutualism, or, if we allow, Mutualism,[1493] as it becomes quite self-aware at this point, as free thought.

Thomas Chubb was a free thinker and deist who, similar to Matthew Tindal, argued that Christianity was based on Nature, and held, similar to Edward Herbert, that prayer was important for deists, who should train the mind always to be aligned with the will of God. He considered the Catholic Church to be the anti-Christ, and held that Reason was a sufficient means of religious understanding. William Wollaston was an English deist, known to the more radical of the founding fathers of America, such as Benjamin Franklin and Thomas Jefferson, who wrote *The Religion of Nature Delineated*, in which he, in part, argued that evil was the rejection of a true proposition whereas good was its acceptance. He defined natural or true religion as the "pursuit of happiness by the practice of Reason and Truth."

[1491] Spinoza[2], 187

[1492] Tindal

[1493] The home of Mutualism, the current of free thought, is largely the synthesis and transcendence of critically-thinking primitive Christianity with rational mysticism and green magic coming largely from neo-Platonism and Hermeticism, which, taken to their logical conclusions, had developed into common sense rationalism and direct realism, free thought being its most radical expression

Elihu Palmer, who was less favorable to Christianity, was an American deist who decried Moses and Mohammed as vicious and forceful rulers, with Jesus merely lacking the opportunities that they did, seeming to echo the sentiments of the author of *The Three Imposters*. He nonetheless also grounds his sense of justice in reciprocity derived from natural principles, in his work *Principles of Nature*. Palmer held that the story of the universal deluge was a contrivance to establish the supremacy of supernaturalism over Nature. He says that to even suggest that God created vast bodies of water for the purpose of destroying the planet is an idea that ought to make the believer blush, because this neither reflects upon the moral goodness of God nor that worth of Creation, thus reflecting a sarcasm that should not be attributed to God. Further, he points to the science of hydrology and the fact that the ark could not fit all of the present species of animals onboard.[1494] Elihu Palmer said that Chinese records went back 20,000-40,000 years, and held that the Earth is itself eternal and that creation and annihilation were not words that applied to the scale of Earth but only modalities upon it. Anticipating Lyell, he held that the forces that produced the first of the great animals upon the Earth were still at work today. Elihu suggested that the natural moral world has been mystified by religion in order to make deformities and distortions more acceptable and to place the moral burden on the Devil instead of upon the shoulders of religionists. He says that true evil is merely "a violation of a law of justice or utility, by any one of the human species, competent to distinguish between right and wrong." That which is good is that which is universally benevolent, and whether there were a thousand or zero deities in existence it would leave the relations of human to human remaining the same. Elihu Palmer grounds his conception of *universal benevolence* in the reciprocal relations or reciprocal benevolence inherent not only in society but also throughout the natural world. He supports the eradication of pains not only to humans, but also to animals, suggesting that the "child who is permitted in early life to run a pin through a fly, is already half prepared to run a dagger through the heart of his fellow creature!" He suggests that as parents must teach their children right action, so too must a social system teach its citizen proper behavior. He denied slavery on the grounds that it was a violation of "reciprocal justice," and held that despite their vast and acknowledged dissimilarities whites and blacks had a similar level of intelligence.

Another figure important to the development of Christian deism was William Paley. In Paley's *Natural Theology*, he made a strong argument for what would come to be known as *intelligent design* by way of teleology. Before referencing a large number of examples from the world of biology and physiology, Paley says to

> suppose I pitched my foot against a stone, and were asked how the stone came to be there, I might possibly answer, that, for any thing I knew to the contrary, it had lain there forever : nor would it perhaps be very easy to show the absurdity of this answer. But suppose I had found a watch upon the ground, and it should be inquired how the watch happened to be in that place, I should hardly think of the answer which I had before given, that, for any thing I knew, the watch might have always been there. Yet why should not this answer serve for the watch, as well as for the stone? Why is it not as admissible in the second case, as in the first ? For this reason, and for no other, viz. that, when we come to inspect the watch, we perceive (what we could not discover in the stone) that its several parts are framed and put together for a purpose, e. g. that they are so formed and adjusted as to produce motion, and that motion so regulated as to point out the hour of the day; that, if the several parts had been differently shaped from what they are,

[1494] An idea, interestingly enough, that Christian Darwinists deny by suggesting that divergent microevolution could have produced different species from one common morphological ancestor

> of a different size from what they are, or placed after any other manner, or in any other order, than that in which they are placed, either no motion at all would have been carried on in the machine, or none which would have answered the use, that is now served by it.
>
> [...]
>
> This mechanism being observed (it requires indeed an examination of the instrument, and perhaps some previous knowledge of the subject, to perceive and understand it; but being once, as we have said, observed and understood), the inference, we think, is inevitable; that the watch must have had a maker; that there must have existed, at some time and at some place or other, an artificer or artificers, who formed it for the purpose which we find it actually to answer; who comprehended its construction, and designed its use.

Paley's Watchmaker Analogy is often criticized by physicalists as holding to a "God the gaps," where gaps in scientific wisdom are exploited as places in which to hide the remaining claims to God. However, it can be countered that this is not the case, but that the "gaps" which remain are uncoverable due to the very nature of Creation, which includes not only deterministic forces from the past, but also teleological ones working from the future. And, as we have no knowledge of or agency from the future, we then have to admit the limits of science, and that idealism or, if we prefer, natural theology may be a better approach to that area of life than a solid philosophy of science allows for. Paley's arguments from naturalism for the existence of God remain compelling, even today, for many strong minds.

These kinds of pantheistic, pandeistic, or radical deistic ideas would continue long after Toland, Tindal, and Paley among radicals and Mutualists who would develop evolutionary theory, such as Robert Chambers and Herbert Spencer. For Spencer, personal and social evolution was of utmost importance, and freedom to develop maintained something of a natural but also theological justification, much in the manner of the preceding radicals. Spencer says, quoted at length, that

> whilst it may be true that a savage asceticism attributes to the Diety a barbarity equal to its own, and conceives him in delighting in human sacrifices; whilst it may be true that amongst ourselves the same notion yet lingers, under the form of occasional fasts, and penances; still there are few if any amongst civilized people who do not agree that human well-being is in accordance with the Divine will. The doctrine is taught by all our religious teachers; it is assumed by every writer on morality: we may therefore safely consider it as an admitted truth.[1495]

He continues,

> Starting afresh, then, from the admitted truth, that human happiness is the Divine will, let us look at the means appointed for the obtainment of that happiness, and observe what conditions they presuppose. Happiness is a certain state of consciousness. That state must be produced by the action upon consciousness of certain modifying influences—by certain affections of it. All affections of consciousness we term *sensations*. And amongst the rest, those affections of it which constitute happiness must be sensations.
>
> But how do we receive sensations? Through what we call *faculties*. It is certain that a man cannot see without eyes. Equally certain is it that he can experience no impression of any kind, unless he is endowed with some power fitted to take in that impression; that is, a faculty. All the mental states which he calls *feelings* and *ideas*,

[1495] Spencer, 81

are affections of his consciousness received through the faculties—sensations given to it by them.

There next comes the question—under what circumstances do the faculties yield those sensations of which happiness consists? The reply is— when they are exercised. It is from the activity of one or more of them that all gratification arises. To the helpful performance of each function of mind or body attaches a pleasurable feeling. And this pleasurable feeling is obtainable only by the performance of the function; that is, by the exercise of the correlative faculty. Every faculty in turn affords its special emotion; and the sum of these constitutes happiness. Or the matter may be briefly put thus: A desire is the need for some species of sensation. A sensation is producible only by the exercise of a faculty. Hence no desire can be satisfied except through the exercise of a faculty. But happiness consists in the due satisfaction of all the desires; that is, happiness consists in the due exercise of all the faculties.

Now if God wills man's happiness, and man's happiness can be obtained only by the exercise of his faculties, then God wills that man should exercise his faculties; that is, it is man's duty to exercise his faculties. For duty means fulfillment of the Divine will. That it is man's duty to exercise his faculties is further proved by the fact that what we call *punishment* attaches to the neglect of that exercise. Not only is the normal activity of each faculty productive of pleasure, but the continued suspension of that activity is productive of pain. As the stomach hungers to digest food, so does every bodily and mental agent hunger to perform its appointed action. And as the refusal to satisfy the cravings of the digestive faculty is productive of suffering, so is the refusal to satisfy the cravings of any other faculty also productive of suffering, to an extent proportionate to the importance of that faculty. But as God wills man's happiness, that line of conduct which produces unhappiness is contrary to his will. Therefore the non-exercise of the faculties is contrary to his will. Either way, then, we find that the exercise of the faculties is God's will and man's duty.

But the fulfillment of this duty necessarily presupposes freedom of action. Man cannot exercise his faculties without certain scope. He must have liberty to go and come, to see, to feel, to speak, to work; to get food, raiment, shelter, and to provide for each and all of the needs of his nature. He must be free to do everything which is directly or indirectly requisite for the due satisfaction of every mental and bodily want. Without this he cannot fulfill his duty or God's will. But if he cannot fulfill God's will without it, then God commands him to take it. He has Divine authority, therefore, for claiming this freedom of action. God intended him to have it; that is, he has a right to it.

From this conclusion there seems no possibility of escape. Let us repeat the steps by which we arrive at it. God will's man happiness. Man's happiness can only be produced by the exercise of his faculties. Then God wills that he should exercise his faculties. But to exercise his faculties he must have liberty to do all that his faculties naturally impel him to do. Then God intends that he should have that liberty. Therefore, he has a *right* to that liberty.

This however, is not the *right* of one but of all. *All* are endowed with faculties. *All* are bound to fulfill the Divine will by exercising them. *All* therefore must be free to do those things in which the exercise of them consists. That is, all must have rights to liberty of action. And hence, there necessarily arises a limitation. For if men have like claims to that freedom which is needful for the exercise of their faculties, then must the freedom of each be bounded by the similar freedom of *all*. When, in the pursuit of their respective ends, two individuals clash, the movements of the one remain free only insofar as they do not interfere with the like movements of the other. This

> sphere of existence into which we are thrown not affording room for the unrestrained activity of all, and yet all possessing in virtue of their constitutions similar claims to such unrestrained activity, there is no course but to apportion out the unavoidable restraint equally. Wherefore we arrive at the general proposition, that every man may claim the fullest liberty to exercise his faculties compatible with the possession of like liberty by every other man.[1496]

Modern Pantheism and Luciferianism

Typically aligned with radical or— in the case of the German idealists and American transcendentalists— Romantic interests, pantheists were highly rational, yet sometimes mystical or magical, forward-thinking individuals. At times building upon the thought of earlier pantheists— such as Eriugena and Bruno—, but also coming to their own conclusions, they largely continued the tradition of anti-authoritarianism and radical republicanism, but this was tempered with respect for the natural processes involved in statecraft. Modern pantheists included Baruch Spinoza, John Toland, Gerrard Winstanley, Gotthold Ephraim Lessing, Johann Gottfried Herder, and Georg W.F. Hegel, among others. They had followed after the early pioneers of modernism, such as Amalric of Bena, Nicholas of Cusa, Giordano Bruno, and others. Pantheists such as Spinoza, Toland, and Winstanley, as with the medieval pantheists, and along with Hegel, would make important impacts during the early modern era. Nicholas of Cusa had tried to balance the roles of hierarchy with consent, and Hegel, a modern pantheist likely inspired by Nicholas, would come to speak of political rulers as absolutes unto themselves, while inspiring a "Left Hegelianism" that interpreted his work as liberatory. But Spinoza and Toland were, like Amalric of Bena and Giordano Bruno, radical republicans.

Baruch Spinoza was a Portuguese-Dutch revolutionary, a radical, democratic-republican philosopher, and Jewish heretic. Baruch or "Blessed" Spinoza had been born into a Sephardic Jewish family that had been crypto-Jews amidst religious repression in their home of Portugal. He had spent much of his time around radical Christians in the Netherlands, and his works are considered to be classics of Christian literature, despite his Jewish heritage and his pantheist theology. R.H.M. Elwes, translator of Spinoza, on the back cover of his translation of the *Ethics*, for instance, puts Spinoza "[i]n the genre of Christian philosophers[…]" While living in Amsterdam during the Dutch Republic and the relative tolerance that persisted there, Baruch Spinoza's books would nonetheless be banned and burned by the Dutch authorities. He'd also be excommunicated by Jewish religious authority and his books were added to the Catholic Church's list of forbidden books. The memory of Giordano Bruno was not so distant at this time, so Spinoza is perhaps lucky to have stayed alive! Spinoza has been noted for a favorable disposition in the memory of his peers, and for having turned down prestigious university teaching positions in order to continue in his trade as a glass grinder, or *oculist*. Ocular science had long been entangled with the occult, perhaps since the time of Ibn Al-Haytham's *Book of Optics* was passed around during the Islamic Golden Age, and ocular science was or would become an important avenue for clandestine Enlightenment of Spinoza's time, so he probably had important and unspoken reasons to stay in the trade. Spinoza died at a relatively young age, however, said to be due to lung issues from breathing the glass particles in his profession.

[1496] Spencer, 91

Portrait of Spinoza, artist unknown

Spinoza wrote three important works, the *Ethics*, the *Improvement of the Understanding,* and the *Theological-Political Treatise*,[1497] wherein he outlined his metaphysical-ethical, psychological, and theological-political comprehension. He was taught by the son of weavers, and a radical Jesuit, by the name of Franciscus van den Enden. Spinoza's philosophy was a rich compilation of rational mysticism, humanistic theology, moral philosophy, social psychology, naturalism, and political thought, and that probably does not cover all of it. According to Spinoza, God or Nature is *Substance*, which expresses itself in infinite attributes, of which two are available to the perception of mortals. These attributes express a myriad of modalities. He held that good and evil were matters of opinion and/or success; that all things were as they were out of the necessity of God's being. Like Nicholas of Cusa, Spinoza stressed that we should come to know as much as we can about God, which he identified with Nature, and must love God, or Nature, rationally, and with all of our being.. He believed that one who lived his life in devout, rational love of God would experience *blessedness*, a condition of mortal contentment and peace of mind. Spinoza believed that by coming to know the reasons for the hardships we face, by

[1497] As well as an unfinished work, the *Tractatus Politicus,* wherein he argues that democracy is not the rule of the majority but instead the rule of natural law, suggesting also that women might take part in democratic governance as well

knowing our hardships as a part of Nature's perfect necessity, that we can come to a Stoic abolition of our "passions" or overpowering emotions, become virtuous. As we can never fully be free of our passions, however, Spinoza suggests we put our efforts to resolving the problems in our life in rational, loving ways. He suggested that only love could conquer hate.

According to Spinoza, might makes right, we can find solace in accepting necessity, and mutuality is the source of political power. For Spinoza, monarchy must be toppled; and democracy had to be established in a clandestine fashion and as a group effort. He was a democrat, with a small *d*, and a proto-Georgist who believed monarchy, aristocracy, and feudalism to rest on the ignorance and superstition of *the multitude*, those who have not succumbed yet to the force of reason. Spinoza's manner of fighting this was the promotion of a clandestine democratic revolution, wherein collective reason pursued in deliberation and majority-rule would produce greater truths than those of individual humans. Condorcet, living in the wake of Spinoza and a participant in the Radical Enlightenment, would later prove this mathematically, giving rise to the theory or field of "social choice."
